This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world’s books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that’s often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book’s long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ **Make non-commercial use of the files** We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ **Refrain from automated querying** Do not send automated queries of any sort to Google’s system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ **Maintain attribution** The Google “watermark” you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ **Keep it legal** Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can’t offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book’s appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google’s mission is to organize the world’s information and to make it universally accessible and useful. Google Book Search helps readers discover the world’s books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at [http://books.google.com/](http://books.google.com/)

THOMAS COATES, Esq., Secretary, No. 59, Lincoln's Inn Fields.
BLOIS, an important city of France on the river Loire, in the department of Loir et Cher. It is 96 miles from Paris in a straight line, S.W. by S., or 105 miles by the road through Étampes and Orléans. It is in 47° 33' N. lat. and 2° 20' E. long.

Blois is a town of considerable antiquity. An aqueduct cut in the rock, which brings water from a spring at the distance of half a mile to a reservoir close to the walls of the town, is thought to be a Roman work; but no Roman geographer has mentioned any place that can be identified with Blois. Gregory, bishop of Tours, a writer of the sixth century (in his History of France), is the first who makes any clear and distinct mention of this town: he calls it Bleso.

Under Charles le Chauve, or the Bald (grandson of Charlemagne), who reigned from 840 to 877, it was a place of some consequence; and under the princes of the second, or Carolingian, race, money was coined here. Under these princes Blois with its surrounding territory was erected into a county, and the counts of Blois seem to have acquired considerable power, but their history and succession are confused and uncertain. Stephen, who usurped the throne of England upon the death of Henry I. in 1135, and his brother Henry, bishop of Winchester, were sons of one of the counts of Blois, by Adela, daughter of William the Conqueror; and the house of Blois was more than once united by marriage with the royal family of France. At length the county of Blois, having been sold to Louis, duke of Orléans, brother of Charles VI., came by inheritance to his grandson, Louis; and upon the accession of this prince in 1498 to the throne of France, under the title of Louis XII., his domains, including this county, became attached to the crown. (Expiilly, Dictionnaire des Gaules, &c.; Millin, Voyage dans les Départements du Midi de la France.) The county of Blois was subsequently made part of the appanage of Gaston, duke of Orléans, brother of Louis XIII., and of Philip, only brother of Louis XIV., from whom it was inherited by the subsequent dukes of Orléans.

After the county was united to the crown, Blois was not unfrequently the residence of the court, and the scene of several important events. Here Louis XII. signed several treaties; and here were celebrated the festivities and tournaments which signalized the marriage of the Duke of Alençon with Margaret, sister of Francis I. Blois was also the scene of festivities in the reign of Henry II., son and successor of Francis; and here Henry IV., married Margaret of Valois, daughter of Henry II. But the most remarkable event of which this city was the scene, was the assassination in the castle of the Duke of Guise and his brother the Cardinal, in the year 1558, during the reign, and by the order, of the king, Henry III. [See Guise.]

The city stands on the north or right bank of the Loire about midway between Orléans and Tours. It is built on the slope of a hill, the summit of which is crowned by the castle: a bridge, erected in 1724, in the place of a more ancient structure, the date of whose foundation was unknown, and which had been carried away by the breaking up of the ice after the hard winter of 1709, unites it with the suburb of Vienne on the opposite side of the river. The upper part of the town, which is the most ancient, has steep and narrow streets; more modern edifices occupy the lower part, and accord well with the fine quay that lines the bank of the Loire. According to local tradition, the most ancient building, if indeed it yet remains*, is the prison. The bridge over the Loire is of stone and has eleven arches.

The curve formed by the road-way is considerable, and the centre is consequently much raised above the bed of the river: in the middle of the bridge rises a pyramid of about 60 feet high (exaggerated in some geographical works to 100), the effect of which is described as at once striking and agreeable. The castle was originally built by the Counts of Blois, and some part of the structure erected by them (viz., a large tower) still remains. The eastern front, under which is the gateway of the court, was built by Louis XII., whose statue, representing him on horseback, which once adorned this part of the building, has been thrown down. The northern front of the building was erected in the reign of Francis I., and another part towards the west by the celebrated architect Mansard at the order of Gaston, duke of Orléans, brother of Louis XIII., to whom (as already noticed) the county of Blois was given as an appanage. When M. Millin visited Blois (in the early part of the present century) the castle was occupied as a barrack; to what use it is devoted at present we are unable to say. The ‘hall of the States’ was, at the time of M. Millin’s visit, used as a place for exercising recruits in bad weather. A tower in this castle is called ‘the tower of Château Renauld or Regnard,’ because from it that place, which is distant eighteen miles, can be seen. The garden attached to the castle was planted by Henry IV., and improved while in the possession of Gaston of Orléans. Morison, an Englishman (who having followed the disastrous fortunes of Charles I., found an asylum in France), published a catalogue of the plants of this garden, which had acquired considerable celebrity.

Of the other public buildings at Blois, the bishop’s palace, which appears to have served for a time as the hotel or office of the prefecture, is one of the handsomest: from its terraced gardens there is one of the most agreeable prospects in France. The present office of the prefecture, built in a large place, or open space: the Hôtel de Ville, or town house, containing the valuable public library; the nunnery of the Carmélites, now used as a dépôt des étoffes; and the Palais de Justice, or court-house, a building erected at various periods, are among the objects best worthy of notice. The public fountains contribute to the cleanliness of the place and the health of the inhabitants. These fountains are supplied by means of leaden channels or conduits from a reservoir to which water is brought by the Roman aqueduct already noticed. The public walk,
which is very beautiful, stretches along the river. (Malte-
Brun.)

Before the Revolution Bois possessed many religious
houses; there were two abbeys, one of Benedictines (called the
Abbey of St. Launer), very ancient, and celebrated for
its school as early as the twelfth century; and one of the
order of St. Augustin, called the Abbey of Bourg Moyen;
convents for Cordeliers, Capuchins, Minimes, and nun-
cerits. In the people one of the Visitation, and the
so-called Véroniques. There was a Jesuits' college pre-
vious to 1764, when that order of ecclesiastics was expelled
from France. There was also an hospital for the sick
(Hôtel-Dieu), attended by the nuns called Hospitalières, an
hospice for poor children, and a seminary for the
education of the priesthood. The buildings at Bois were
very much injured by the Protestants in the religious wars
of the sixteenth century. The buildings of the Abbey
of St. Launer are now used as an hospital, and those of the
Abbey of Bourg Moyen, for the college or high school
for the church of the Abbey of St. Launer, now called St. Nicholas.

is a remarkable monument of the architecture of a period
when the Gallo-Roman style was passing away.

The gates of Bois have an image of the Virgin placed
over them all, in commemoration of the deliverance of the
townsmen from a dreadful pestilence which ravaged the
place in 1631, and from which they were, as they deemed
it, miraculously delivered in consequence of a vow which
they made to the Virgin. (Expi. Dictionnaire des
Géographes.)

On the side of the Loire opposite to Bois is the populous
suburb of Vienne. As it is not mentioned separately in
the returns of the population for 1832, we presume its
population was included in that of Bois, which at that
time was 2,089 souls; for the town of Vienne has kept
from the whole commune. The people of this town have the reputa-
tion of speaking French with great purity, free from any
provincialism; but the justness of the eulogy has been dis-
puted by some, who consider it to have been a mere com-
plimentary inference from the frequent residence of the
court here. There are at Bois a Collège or high school, which
however is not of any great importance or repute, two
hospitals, a cabinet of natural history, an agricultural so-
ciety, a public library (already noticed), and a theatre. (M.
Robert. Dictionnaire Géographique...) Near Bois are the schools of
Menars, established by the Prince of Chima, of which an
account is given in No. XIII. of the Journal of Education,
and of which we subjoin the following particulars transmitted
to us (1835) from Bois:

is a large five miles W. of Bois on the
bank of the Loire, containing in the midst of a large park a
very fine château, which was for some time the residence of
Madame de Pompadour. A new and more powerful inte-
rest now attaches to that magnificent building, as the Prince
Joseph de Chimay, the successor of the 'Château de Menars,' has,
derived, under the title of the 'Prytaneum,' extensive esta-
blishments for instruction, rational in its character, and
designed for special purposes,—instruction which corresponds
to the varied wants of the different classes of which society
is composed. Thus the first division of the Prytaneum,
called the 'Institute of Commerce and the Belles Lettres,'
embraces on the one hand a complete course of scientific
and literary instruction, and on the other a complete com-
mercial education.

the School of Arts and Trades. There are seven workshops in this
department; those of the wheelwright, joiner and cabinet-
maker, blacksmith, polisher and finisher of hardwares,
turner in wood, saddler, and cutter. Theoretical and prac-
tical instruction are combined in the School of Arts and
Trades. Lastly, the third division, called the 'School of Pioneers' (Ecole des Pionniers), a term employed in an
enlarged sense, comprehends the trades of tailor, shoe-
maker, bricklayer (maçon), Sawyer, gardener, &c. Dif-
ferent localities are assigned to each division of the Pry-
taneum.

The success of the Prytaneum, which was founded only
three years ago, has settled the question of education for
special purposes which has so long occupied attention, and
which some men of liberal minds have at different times
suggested. The Prytaneum of Bois has solved this question
never yet been solved as it now is by the 'Prytaneum de
Menars.' This work of civilization and of moral improve-
ment has inscribed in the list of benefactors to their country

The name of Prince Joseph de Chimay, who, with rare per-
severance, and at great sacrifices, has so completely dedi-
cated himself to the noble labour of improving education,
at an age when so many men have scarcely finished their

The manufactures of this town consist of serges and
other light woollens, leather (which branch of industry has
declined), Yarn, and hessian, glass, glues, and

These articles, there being a market in each trade is carried on, as timber, drugs, wine, brandy, and

Bois is the capital of the department. It has a tribunal de
première instance, of subordinate court of justice, and a
tribunal de commerce, or court for the settlement of mer-
chantile disputes. The arrondissement of Bois comprehends
718 square miles, or 459,520 acres, and had, in 1832, a popu-
lation of 114,307. It was subdivided into ten cantons and
40 communes.

Bois was made the seat of a bishopric in the year 1697,
and was, with the exception of the bishoprics of Dijon and
St. Claude, the latest of those established up to the Revo-

Under the reduced hierarchy of the present day it main-
tains its episcopal rank. The diocese comprehends the
department of Loir et Cher; the bishop is a suffragan of the
Archbishop of Paris. The celebrated M. Grégoire was
bishop of Bois, or rather of the department of Loir et Cher
under the constitution of Civil du Clergé, 1791; but as the
church has always protested against that act, he is not
considered in the commission of this work.

Among the more eminent natives of Bois may be men-
tioned the good king Louis XII, under whom, as already
noticed, the county of Bois was united to the crown; Father
Jean Morin (Morinus), a learned orientalist and bibil-
eal scholar; and the Marquis de Patras, who was executed
at Paris in the year 1790 upon a charge (whether true or
false) of having formed the project of a counter-revo-
lution.

The county of Bois (commonly called in maps Le Blaisois,
but written by some Le Bliès) is bounded on the north
by Le Dunois and L'Orléanais, properly so called, on the
east and south by Berry, from which it is separated in one
part by the Cher, and on the west by Tournaine and

Le Dois is divided into two parts by the Loire; the upper
part to the north part of the department of the district of
Sologne, one of the most barren tracts in France. The
Leoi is the only river of any importance which flows
through it; the Beuvron and the Cosson, which fall into
that river on the south side, are of minor importance, as
the course of the Beuvron falls into the Cher, and the
Sauldre, a tributary of the Cher, waters the southern part.
The chief towns in the Blaisois, beside Bois, already
described, were Romorantin, St. Dié, and Mer. Romorantin
had, in 1832, 6537 inhabitants, or 6985 for the whole com-

communication of which society

The School, a M.A., F.S.A., rector of
Fresefield in Norfolk, and author of a very excellent history
of that county, was born at Fresefield on July 23rd, 1705.
He was first educated at Diss, and then at Tetsford, from
whence he was sent to Gonville and Caius College, Cam-
bridge, in 1724. He took his degree of B.A. in 1727, and
in the same year was ordained deacon on the recommendation of St. Giles in the Fields, London; and in the following
year was made a licensed preacher by Dr. Tanner, then
chancellor of Norwich. In 1729 he was instituted rector of
Hargham in Norfolk, on the presentation of Thomas Hare,
and was also a member of the vestry. In 1734 he was
appointed to the rectorship of Fresefield, on the presentation of his own father, Henry Blomefield, Gent. He continued to hold both rec-
tories till 1750, when he relinquished Hargham. The
above particulars are derived from the genealogical table
in the "Historical and Genealogical Account of the
Hare Family," by John Hare, a descendant of the
family. The Hares have found it difficult to get any further information
concerning him, as the continue of his work and the editor of
the new edition do not furnish any additional facts. The
publishers of the last edition, in eleven vols. 8vo., commenced in 1805, exerted themselves to procure a likeness of Blomefield, and having ascertained that there was none in existence, undertook the matter of furnishing a portrait intended for another person, but which was considered a striking likeness of the historian of Norfolk.

Blomefield's death must have taken place in or subsequent to 1765. He was born in 1707, and his work, printed in his own life, was completed and the publication began in numbers in 1739. It was left unfinished at his death, when he had carried it to nearly the end of the third (folio) volume, and the completion was ultimately undertaken by the Rev. C. Parkin, rector of Orxburgh, who had rendered some assistance to Blomefield in the previous portion, and had himself formed considerable collections. This gentleman finished the third volume, and added two more, which are considered inferior to those by Blomefield. However, no part of Mr. Parkin's continuations is more highly valued than that by them in the last, which was issued by the bookseller who had purchased his library, which included that of Blomefield. The second volume was published in 1743, the third, completed by Parkin, not till 1769, and the fifth and final volume appeared in 1773. Blomefield was greatly assisted in his work by the collections which had been formed by Peter Le Neve, norroy king-at-arms, who spent about forty years in amassing at great expense and trouble the greatest collection of facts for the history of Norfolk that was ever formed for any county in England, and which, considering its kind, is one of the most important. By them, above all, was the late Mr. T. Tanner, who, having been chancellor of the diocese, was acquainted with a vast number of records relative to the county. Parkin also had the benefit of Le Neve's collections, as well as of those which had been formed by Blomefield himself. The modern work of Venables, Viti, and Viti de Peclet, Lecanaria Cantabrigenisa, a collection relating to Cambridge University, town, and county. Although printed so late, the materials seem to have been collected before he began the 'History of Norfolk,' that is, between the years 1724 and 1734, including the period of his residence at the university.

(History of Norfolk, folio and 8vo. editions; Gough's British Topography.)

BLONDEL, or BLONDIAUX, Fransois Jules de, the son of the poet and friend of Richard I. de Hœdic, lord of that castle, whom he accompanied to Palestine. He is also called Blondel de Neales, from his name of his native town; but Fauchet (Origine de la Langue et Posée Française, Paris, 1851), in his series of French poets anterior to 1300, exclusively mentions him as the poet of the Faustine, a tale critical with Richard's minstrel. Accordingly, he bestows a separate article on each, giving under the head of Blondel de Neales extracts from some of his songs, written in the Norman French, or 'Langue d'ou'; while under the head of Blonnel, Richard's favorite, he relates the story of his wandering through Germany in 1193 in search of his master, who, on his return from Palestine, had been made a prisoner by Leopold duke of Austria, and confined in some unknown fortress. On arriving under the walls of Lowenstein, Blonnel, who, having some intelligence of the place, conspired with some of the prisoners that he was Richard, the prisoner, began singing an air which they had composed together, when to his joy he heard Richard's voice responding and concluding the song. The discovery led to Richard's release. This tale, which Fauchet gives on the authority of a published until after his death, was subject of a well-known opera by Grevy. The truth of the story however is doubted. (See Berrington's History of Richard I., and the article Blonnel, in the Biographie Universelle.) This last style Richard's Blonnel 'Blondeau de Neales' considering them the same, and it states that there are twenty-nine of his songs in MS. in the National or Royal Library, and in the library of the Arsenal at Paris.

BLOOD, the animal fluid contained in the tubes called from their office blood-vessels. As long as it is retained in its proper vessel, and as long as the vessel remains alive, the blood is always found in a fluid state, but essentially it is a solid substance. It is the most complex substance of the animal body. It is composed of several distinct constituents, each of which is endowed with specific properties, and as the result, the body is as peculiar that there is nothing perfectly analogous to it.

On first flowing from its vessel the blood is a thick, viscid, and tenacious fluid. In all the more highly-organized animals it is of a red colour; but redness is not an essential property of it. Other animals which are not vertebrate possess true and proper blood, this fluid is tinted a red colour and there is no animal whose blood is red in all the parts of the body. In the transparent cornea of the human eye there is abundance of blood; but the blood contained in the minute vessels of this delicate membrane is not red. The blood of this insect is colourless and transparent; that of the reptile is of a yellowish colour; in the main part of the body of the fish, that is, in the whole of its musculature system, the blood is without colour; hence the whiteness of the general substance of the body of the fish: but in the more important organs, and especially in those which constitute the organs of nutrition, called the organic organs, the blood is of a red colour, as in the heart, the branchiae or gills, and so on. In the bird the blood is of a deep red; but it is the deepest of all in the quadruped. In some species of quadrupeds it is of a dark red or black; and in the hare, for example, it is dark brown, and is much deeper than in the rabbit. It is deeper in some varieties of the same species than in others, and more especially in different varieties of the human family. Nay, it is deeper in some individuals of the same race than in others, and even the same individual has different blood of different colours, according to age, to the states of health and of disease, and to different species of climate.

In man and all the higher animals the body contains two kinds of blood, each of which is distinguished by a striking difference in a kind of liquid in all the blood. Some of the blood contains red corpuscles to form a drop red and yellow corpuscles to form a drop blood. The red corpuscles are kinds, two kinds of red corpuscles are of two kinds. They are of two kinds, and have different properties, more especially in the organ essential properties less than in its colour: venous blood is incapable of nourishing the body and of stimulating the organs; arterial blood is the proper nutrient and stimulant of the system.

The specific gravity of human blood (water being 1000) may be stated to be about 1050, from which standard it is capable of increasing to 1120, and of sinking to 1026, this being the extreme range of variation hitherto observed. Venous blood is heavier than arterial blood, the former being 1032, and the latter 1030. The difference in weight depends, as will be seen immediately, on the excess in venous blood of carbonaceous matter. The higher the organization of the blood the greater is its specific gravity: hence the specific gravity of the blood of the higher animals is greater than that of the lower; and the lower animals have less carbonaceous matter, and the change produced in the human blood by disease is generally attended with a diminution of its weight. In one instance on record the specific gravity is stated to have been as low as 1022.

There is a remarkable difference in different classes of animals in the temperature of the blood. In some it is only a degree or two above that of the surrounding medium. Creatures with blood of this low temperature are called cold-blooded, in contradistinction to warm-blooded animals, whose temperature is maintained, under whatever variety of circumstances, at a temperature higher than that of the surrounding air. The temperature of the blood of the bird is higher than that of any other creature. In the duck it is as high as 107°. In many quadrupeds it is considerably higher than in man: as in the sheep, in which it ranges from 102° to 105°. In man it is 109°. Arterial blood is warmer by one degree than venous blood.

Disease is capable of effecting a considerable change in the temperature of the blood. In almost every case of fever the temperature of the blood differs from the natural standard of 100°. In certain fits of intermittent fever (ague) it sometimes sinks as low as 94°; in some types of continued fever it rises as high as 102°. In inflammation of moderate severity it exceeds the natural standard by 4°; in intense inflammation it is capable of rising above it as high as 7°.

The chemical properties of the blood are highly curious. When blood is taken from its blood-vessel, and allowed to remain at rest, it soon separates spontaneously into two dis-
distinct parts, into a solid mass and into a fluid matter, in which the solid mass swims. The solid portion of the blood is termed the clot, or the esrussament; the fluid portion is called the serum. As the process of such a separation takes place it is denominated coagulation.

The change in the constitution of the blood by which this separation into a solid and a fluid portion is effected, probably commences the very instant the blood leaves the blood-vessel. In the space of a second or two after the blood is sufficiently advanced to be manifest to the eye; in seven minutes the fluid is separated from the solid portion; while the change progressively advances until, in the space of from two to twenty minutes, the separation may be said to be complete.

The nature of this curious process is imperfectly understood. It is a process sui generis, there being no other with which we are acquainted perfectly analogous to it. It is really, as will be shown immediately, a process of death; it is the modern in which the blood dies.

A watery vapor, called the halitus, begins to arise from the blood the moment coagulation commences, and continues to issue from it until the termination of the process. The halitus consists of water containing some animal matter in solution. It possesses a very peculiar odor, and it is this which gives to the slaughter-house its characteristic taint.

The clot or esrussament, the solid part of the blood, further separates into two portions, a substance of a yellowish white colour forming the top of the clot, and a mass of blood matter the bottom of the clot. When the yellowish substance forming the top of the clot is completely separated from the red mass, it is found to be a solid of considerable consistency, soft, firm, elastic, and tenacious, or glisty. Its distinctive character is derived from the disposition manifested by its component particles to arrange themselves into minute threads or fibres; these threads or fibres are often so disposed as to form a complete net-work.

In its general aspect, as well as in its chemical relations, this substance bears a striking resemblance to pure musculo-collagen; it is also similar to that enveloing membrane and of its colouring matter.

Several names have been given to this substance, glutin, coagulable lymph, fibre of the blood, and fibrin; the latter is the name commonly appropriated to it. Of all the constituents of the blood fibrin is by far the most important. Whatever other constituent may be absent, this, in all animals which possess blood, is invariably present. The main part of all the solid structures of the body is composed of it; it forms the basis of muscle, and in the lower animals, in which blood vessels cannot be traced, it probably performs the function of muscle.

The second constituent of the clot, the red matter, being heavier than the fibrin, gradually subsides to the lower surface, where, as has just been stated, it is always found forming a distinct accumulation below the clot. The nature of this matter to the fibrin differs exceedingly in different classes of animals, and even in the same animal at different times, the difference depending on circumstances mainly connected with the general health and vigour of the system. The greater the energy and the animal, the larger is the proportion of this red matter, and it is also generally large in proportion to the elevation of the animal temperature.

Considerable diversity of opinion prevails respecting the intensity of this nature of this constituent of the blood. What is certain is, that it is composed of innumerable minute particles which vary in size in different animals. It is universally admitted that these particles, minute as they are, are highly organized; but physiologists are not agreed respecting their structure. By some observers they are supposed to be formed of solid colourless nuclei enclosed in an external envelope of a red colour, to which the colour of the blood is owing. By others they are described as consisting of circular, flattened, and transparent cakes, which when seen in cross-section near the edge of the clot, which assume a reddish tinge when aggregated in considerable masses. According to these physiologists, the edge of these cakes is rounded, and this being their thickest part, there is consequently a slight depression in the middle, on both surfaces, which is similar to the veiny appearance which these bodies are conceived most nearly to resemble a penny-piece, with its thickened margin and slightly concave surface. According to this account, the red particles are wholly des-

...
It is established on indubitable evidence, that the blood which maintains the life of all the other parts of the body is itself alive. The phenomena which prove this are highly interesting.

1. It is one of the distinctive properties of living bodies that they are capable of resisting, within a certain range, the ordinary influence of physical agents on inanimate matter. Air, heat, moisture, and other physical agents have no power over the organized and living body as they have over inert matter. This is a principle in the living body which resists the ordinary physical and chemical changes produced by such agents. An egg, for example, as long as it is fresh is alive, and as long as it remains alive it is capable of self-preservation under circumstances which rapidly decompose it when its vitality is extinguished. During the period of incubation the egg is kept at the heat of 105° F. for the space of several weeks in succession, without undergoing the slightest degree of putrefaction; if its vitality is destroyed, which may be done instantaneously by passing the electric fluid through it, it becomes putrid at that temperature in a few hours. The egg has the like power of resisting cold, which was proved in a beautiful manner by some experiments of John Hunter, so managed as to show at the same time both the principle of the vitalist in resisting the physical agent, and the influence of the physical agent in diminishing the energy of the vital principle. He exposed a living egg to the temperature of 17° and 15° of Fahrenheit; it took half an hour to freeze it. When thawed and again exposed to a temperature of 15°, it was as high in vitality as before, reduced in a quarter of an hour. A living egg, together with one that had been already once frozen and again thawed, were put into a freezing mixture at 10°; the dead egg was frozen twenty-five minutes sooner than the fresh. In the one case the diminished vitality of the frozen egg enabled it to resist the low temperature for a long time; in the other case, in consequence of the diminished or destroyed vitality of the frozen egg, it yielded speedily to the influence of the physical agent. Now precisely analogous results were observed in some experiments made on the blood. On ascertaining the degree of cold and the length of time necessary to freeze blood immediately taken from the blood-vessel, it was found that, as in the egg, a much shorter time and a much less degree of cold were required to freeze blood that had previously been frozen and again thawed, than blood recently taken from a living vessel, and for precisely the same reason. In blood recently drawn from the blood-vessel, its vitality being comparatively undiminished, it is able to resist cold longer than the vital principle, which is already nearly exhausted by exposure to the influence of the physical agent.

This result is analogous to a phenomenon recently observed in the coagulation of the blood, dependent on the same principle, and placing in a striking light the influence of blood-letting in diminishing the vitality of the blood. It has been stated that coagulation is a process of death, the mode in which the blood dies. Accordingly it is found that coagulation is slow, that is, that the blood is longer in dying according to the vital energy of the system. When blood is taken from a blood-vessel in disease attended with great debility, as in the typhoid types of fever, it coagulates with extreme rapidity, or is even incapable of coagulating at all; whereas, on the contrary, it is taken in diseases attended with an exaltation of the vital energy, as in intense inflammation, it is not coagulated by Le or for a longer time. The reason is obvious. But it is remarkable that even during one and the same operation of blood-letting there is a manifest difference in the time in which the blood taken at the beginning in the middle, and at the end of the operation is coagulated. Blood power to rise from horse at four times, about one minute and a half intervening between the filling of each cup.

In cup No. 1 coagulation began in 11 M. Sec. 10 5
2 3 5
In like manner three cups were filled with the blood of a sheep at the interval of half a minute:

In cup No. 1 coagulation began in 3 10 5
2 3 5

The same result was obtained in blood taken from a human subject. A pound and a half of blood was removed from the jugular vein of a child of 12, and a fourth of which received into a teacup on the first effusion remained fluid for the space of seven minutes; a similar quantity taken immediately before tying up the arm was coagulated in three minutes, thirty seconds. These experiments prove that coagulation is from the vital energy of the blood is exhausted or unexhausted, or that in proportion to the degree of life possessed by the blood is the space of time it takes in dying.

In the second place the vitality of the blood is demonstrated by another class of phenomena. If a living egg be exposed to a degree of heat equal to the temperature at which the egg is maintained during incubation, certain motions or actions are observed spontaneously to arise in it which terminate in the development of the chick. An analogous process takes place in the blood of the embryo. This blood can be preserved from its vessels in the living body, either upon the surfaces of organs or into cavities, it solidifies without losing its vitality. This is not the same process as the coagulation of the blood out of the body; it is a vital process, indispensable to the action, and completely under the control of the vital principle. If blood thus solidified within the body be examined some time after it has changed from the fluid to the solid state, the solid is found to abound with blood-vessels. Some of these vessels can be distinctly traced past the surrounding tissue to the original of the solidified blood; with others of these vessels no communication whatever can be traced. Now these vessels, the origin of which cannot be traced external to the solid mass, were supposed by Mr. Hunter to be formed within it. Were this really the case, then the consequent action terminating its organization; an action perfectly analogous to that by which the incubated egg commences a series of movements which terminate in the development of the chick; an action never observed to take place in any other case followed without such an effect. This argument, however, is not really affected by the question as to the extrinsic or intrinsic origin of the blood-vessels. What is certain is, that a clot of blood surrounded by living parts becomes organized; what is certain is, that no dead substance thus surrounded by living parts does become organized, and itself alive. While flowing in its living vessel the blood is always maintained in a state of fluidity, in consequence of the state of repulsion both of its red and of its fibrous particles: and the maintenance of this fluidity is indispensable to life, for the blood could not circulate, or be returned to its source, which is in the capillary branches of the veins, if it approached the solid state.

Of the changes which the blood undergoes in health and disease (the changes of the blood in the latter case constituting its pathalogy) a brief view is exhibited in the following extract from the Philosophy of Health:—Health and life depend on the quantity, quality, and distribution of the blood. The chief source from which the blood itself is derived is the chyle; hence too much or too little food, or too great or too little activity of the organs that digest it, may render the quantity of blood preternaturally abundant or deficient; or, though there be neither excess nor deficiency in the quantity of nourishment formed, parts of the blood may not be united, or particles of the solid may not be retained to pass through the constantly diminishing tubes of the arteries and the capillary branches of the veins, if it approached the solid state.

The relative proportion of every constituent of the blood is capable of varying; and of course in the degree in which the healthy proportion is deranged, the quality of the mass must undergo a corresponding deterioration. The watery portion is sometimes so deficient, that the mass is obviously thickened; while at other times the fluid preponderates, so that the solid is reduced. But in either case the blood is thin and watery. The albumen, the quantity of which varies considerably even in health, in disease is sometimes twice as great, and at other times is less than half its natural proportion. In some cases the fibrin preponderates so much as to form a mass that is coagulated, coagulum is formed; in others it is so small, that the coagulation is imperfect, forming only a soft, loose, and tender coagulum, and in extreme cases the blood remains wholly fluid. When the vital energy of the system is great, the red particles abound; when it is depressed they are deficient. In the former state they are of a bright red colour; in the latter dusky purple or even black.

When the depression of the vital energy is extreme, the power of mutual repulsion exerted by the particles would seem to be so far destroyed, as to admit of their adhering to each other with an intensity that can only be conceived as a perfect disorganization, and as they seem to be actually disorganized, and to have their structures so broken up, that they escape from the current of the circulation as if dissolved in the serum, through the minute vessels intended only for the exhalation of the watery part of the blood. This change is conceived to have an intimate connexion with a diminution of the saline constituents. Out of the body, as has been shown, the red particles change their figure instantaneously, and are rapidly dissolved when in contact with pure water; while they undergo this change of form, if the water has saline matter in solution. It would seem that one use of the saline constituents of the blood is to preserve entire the figure and constitution of the red particles. It is certain that any change in the proportion of the saline constituents produces a most powerful effect on the condition of the red particles. It is no less certain that changes do take place in the proportion of the saline constituents. In the state of health the taste of the blood is distinctly salt, depending chiefly on the quantity of muriate of soda contained in it. In certain malignant diseases the taste of the blood is entirely different, and the blood is of a saline, bitter, and more especially that form of it termed pestilentia cholerica, this salt taste is scarcely, if at all, perceptible; and it is ascertained that, in such cases, the proportion of saline matter is sensibly diminished.

The blood in health and disease is much altered by the disturbance of the balance of certain organic functions—digestion, absorption, circulation, respiration, are indispensable to the formation of the blood, and to the nourishment of the tissues. Absorption, nutrition, secretion, circulation, and respiration are all impeded by the direct or indirect irritation of the parts, or by substances which are accumulated in the body, or by destroying the relative proportion of its constituents. Organs are specially provided for the main function of which is to separate and remove from the blood these injurious substances. Organs of this class are called depurating, and the reservoirs they are named are denominated that of depuration. The lungs, the liver, the kidneys, are depurating organs, and one result at least of the functions they perform is the purification or depuration of the blood. If the lung fail to eliminate carbon, the liver bile to eliminate bile, and the kidneys fail to eliminate the constituents of which these substances are composed, must accumulate in the blood, contaminate it, and render it incapable of duly nourishing and stimulating the organs.

But though the blood be good in quality and just in quantity, it may be injurious in its distribution. It may be sent out to the system too rapidly or too slowly. It may be distributed to different portions of the system unequally; too much may be sent to one organ, and too little to another; consequently, while the latter languishes, the former may be oppressed, overcharged, or stimulated to violent and destructive action. In either case health is disturbed and life endangered.

The Society of the Literary Fund are in possession of two daggers: the one used by Colonel Blood in his attack upon Edwards, the other by an accomplice. The inscriptions on the sheaths of each record the facts. They came to the society, with other residuary property, by the bequest of Sir Thomas More.

(See Remarks on Some Eminent Passages in the Life of the Fam'd Mr. Blood, fol. Lond. 1680; Sir Gilbert Talbot's Narrative of Blud's Attempt on the Crown in the Tower, M.S. Harl. No. 6859; Bogg. Britanni., Kippis's edit. vol. 2, p. 361; and Lord Chief Justice Coke Concerning the Design Reported to be laid Against the Life and Honour of George, Duke of Buckingham, folio, London, 1680.)

BLOOD-DOWN, the name of a land, celebrated for its exquisite scent and unweary perseverance, qualities which were taken advantage of, by training it not only to the pursuit of game, but to the chase of man. A true blood-hound (and the pure blood is rare) stands about eight and twenty inches in height, muscular, compact, and strong; the forehead is broad, and the face narrow towards the muzzle; the nostrils are wide and well developed; the ears are large, pendulous, and broad at the base; the aspect is serene and sagacious; the tail is long, with an upward curve when in pursuit, at which time the hound opens with its nose a wondrous, savage noise, that may be heard down the wind for a very long distance.

The colour of the true breed is stated to be almost invariably a reddish tan, darkening gradually towards the upper parts till it becomes mixed with black on the back; the muzzle is tawny. Pennant adds, 'a black spot over each eye,' but the blood-hounds in the possession of Thomas Astle, Esq. (and they were said to have been of the original breed) had not these marks. Some, but such instances are very rare, are little whiter on the head, with a star in the face, &c. The better opinion is, that the original stock was a mixture of the deep-mouthed southern hound, and the powerful old English stag-hound.

Gervase Markham, in his 'Maison Rustique,' speaking of blood-hounds, says, 'They are at their best when weathered for goodnesse, and are of great courage, venturing far, and of a quicke scent, finding out very well the turns and windings . . . . . . . they runne surely, and with great boldnesse, commonly loving the stagge more than any other beast, but they make no account of hounds. It is true that they be more head-strong and hard to reclaime than the white, and put men to more paine and travaile about the same. The best of the fallow sort of dogges, are those which are of a brighter haire, drawing more unto the colour of red, and running thereafter with white in the face, or in the necke, in like manner those which are all fawle: such as incline to a light yellow colour, being gracie or blake spotted, are nothing worth: such as are truss up and have dewclaws, are good to make bloodhounds.'

Our ancestors soon discovered the infallibility of the bloodhound in tracing any animal, living or dead, to its resting place. To train it, the young dog accompanied by a staunch old hound was led to the spot whence a deer or other animal had been taken on for a mile or two: the hounds were then laid on and encouraged, and after hunting this 'drag' successfully, were rewarded with a portion of the venison which composed it. The next step was to take the young dog with his seasoned tutor, to a spot whence a man whose shoes had been rubbed with the blood of a deer had started on a circuit of two or three miles: during his progress the dog insensibly followed the track, from time to time, to keep the scent well alive. His circuit was gradually enlarged at each succeeding lesson, and the young hound, thus entered and trained, became, at last, fully equal to hunt by itself, either for the purposes of woodcraft, or as a drover in the open fields. There is no doubt that a dog so trained would be useful in a border foray was termed. Indeed, the name of this variety of canis domesticus, to which Linnaeus applied the name of Sagax, cannot be mentioned without calling up visions of feudal castles with their train of knights and hounds, of the olden times when the best tenure was that of the strong hand.

Sir Walter Scott gives a striking reality to the scene, when he makes the stark moss-trooper, William of Deloraine, who had 'baffled Percy's best blood-hounds,' allude to the pleasure of the chase, though he himself was the object of pursuit, in pronouncing his eulogy over Richard Musgrave,
The Minstrel concludes his story with the following catastrophe. The lonely tower of Gask was Wallace's place of refuge. One evening, a horn roused him at midnight. He sent out his men by two and two, but none came back. At last he was alone — and the blast became louder. Down went the hero sword in hand, and, at the gate of the tower, came full upon the headless figure of Fawdon. He fled back, the door closed behind him, tore open the bolts of the window, leaped down a height of fifteen feet in his terror, and rushed up the river. At length, on looking back, he beheld the tower wrapped in flame, and the dilated form of Fawdon upon the turrent holding in its gigantic hand a blazing beam. But

— The knights are dust,
And their good swords are rust—

There are with the Sultane's trust —

— and it is necessary to bring down the history of the blood-bond to our own unromantic times.

Sir Walter Scott states that the breed was kept up by the Buccleuch family on their border estates till within the eighteenth century, and records the following narrative:—

'A person was alive in the memory of some who remembered a blood-bond being kept at Eldinhome, in Ettrick Forest, for whose maintenance the tenant had an allowance of meal. At that time the sheep were always watched at night. Upon one occasion, when the duty had fallen upon the narrator, he became familiar with fitchings, and fell asleep upon a bank, near sun-rising. Suddenly he was awakened by the tread of horses, and saw five men well mounted and armed ride briskly over the edge of the hill. They stopped and looked at the flock; but the day was too far broken to chance the prospect of their carrying them off. One of them, in spite, leaped from his horse, and, coming to the shepherd seized him by the belt he wore round his waist; and setting his foot upon his body pulled it till it broke, and carried it away with him. They rode off at the gallop, and the shepherd giving the alarm, the blood-bond was turned loose, and the people in the neighbourhood alarmed. The marauders, however, escaped, notwithstanding a sharp pursuit. This circumstance serves to show how very long the license of the Borderers continued in some degree manifested itself.

This, perhaps, is the last instance of an attempted Border foray on record. The times were changed. The nobles had ceased to pride themselves on their ignorance of all the arts save art of war, and to make it matter of thanksgiving that they knew not how to use the pen. Civilization advanced as learning was diffused, till the law of the strongest no longer prevailed against the law of the land. The blood-bond, from the noble pursuit of heroes and knights, 'minions of the moon,' who swept away the cattle of the good-natured people, has passed into the hands of the Borderers, a raid by all the Borderers on account of his head, sank to the tracker of the deer-stalker and petty felon. About a century and a quarter ago, when deer-stealing was a common crime, the park-keepers relied upon their blood-bonds principally for detecting the thief; and so adroit were these dogs, that when one of them was fairly laid on, the accused of the criminal was with good reason considered to be all but impossible. Even now the breed still lingers about some of the great deer-parks; and many of our readers will remember the noble specimen at Richmond Park, bearing the name of the deer-stalker, and the word engraved by T. Landseer from a painting by his brother Edwin, published in the Sporting Magazine. In the spring of this year (1835), there was a grand picture of one of these dogs in a sleeping attitude by Edwin Landseer, exhibited in the British Gallery, Pall Mall. It is said that the original unfortunately broke its neck in leaping out of a window in London, and application was immediately made to the painter to perpetuate the memory of so fine a hound.

This noble variety is now only kept as an object of curiosity; and for its service it has been superseded by the justice's warrant and the police-officer. We find it, indeed, recorded about thirty years ago, that the Thrapston association for the prevention of felonies in Northamptonshire have provided and trained a blood-bond

for the detection of sheep-stealers. To demonstrate the unerring infallibility of this animal a day was appointed for public trial; the person he was intended to hunt started, in the presence of a great concourse of people, about ten o'clock in the forenoon, and at eleven the hound was laid on. After a chase of an hour and a half, notwithstanding a very indifferent scent, the hound ran up to the tree in which he was secreted, at the distance of fifteen miles from the place of starting, to the admiration and perfect satisfaction of the very great number assembled upon the occasion. But this may be considered more in the light of a proceeding in terror than anything else.

Strong and Hardy as the blood-hound seems to be, it is unable, apparently, to encounter a low temperature. Mr. Lloyd, in his 'Field Sports,' relates that one presented to him by Mr. Otway Cave was entirely paralyzed by the piercing cold of the northern regions which were the scene of his exploits.

(English blood-hound)

Cuban Blood-hound.—The reputation which this variety has obtained for sagacity and fierceness, and the share that the terror of its name had in extinguishing the last Maroon war in Jamaica, render it an object of some interest. In 1733 these Maroons had become very troublesome, and the Assembly, among other plans for suppressing them, appointed garrisons, from whose barracks excursions were from time to time made against the insurgents. 'Every barric,' says Bryan Edwards, 'was also furnished with a pack of dogs, provided by the churchwardens of the respective parishes, it being foreseen that these animals would prove extremely serviceable, not only in guarding against surprises in the night, but in tracking the enemy.' The tiresome war went on, however, till at last articles of pacification with the Maroons of Trelawney town were concluded on the 1st of March, 1738. This alliance continued, not without frequent complaints of the conduct of the Maroons, till July, 1755, when two of these people from Trelawney town, having been found guilty by a jury of stealing some pigs, were sentenced to receive thirty-nine lashes each, and the sentence was executed. On their return to Trelawney town their account drove the Maroons into open revolt, and a bloody and successful war was waged by these savages against the whole force that the government could direct against them.

At last, the Assembly, in the month of September, remembering the expedient of employing dogs previous to the treaty of 1728, resolved to send to the Island of Cuba, for one hundred blood-hounds, and to engage a sufficient number of Spanish huntsmen to direct their operations. The employment, according to Edwards, to which these dogs are generally put by the Spaniards, is the pursuit of wild bullocks, which they slay for the hides: and the great use of the dogs is to drive the cattle from such heights and recesses in the mountainous parts of the country as are least accessible to the hunters. This determination of the Assembly was not made without some opposition. It was urged that the horrible enormities of the Spaniards in the conquest of the new world would be brought again to remembrance. It is mournfully true, continues Bryan Edwards, 'that dogs were used by our ancestors against the peaceful and inoffensive Americans, and the just indignation of all mankind has ever since branded, and will continue to brand, the Spanish nation with infamy for such atrocities. It was foreseen and strongly urged as an argument against their appointment, a just protest in the present case, that the prejudices of party and the virulent zeal of faction and bigotry would place the proceedings of the Assembly on this occasion in a point of view equally odious with the conduct of Spain on the same blood-stained theatre in times past. Nevertheless, the act was made for the wide difference existing between the two cases. Some gentlemen even thought that the co-operation of dogs with British troops would give not only a cruel but also a very dasrtardly complexion to the proceedings of government.

However, it was said that the safety of the island and the lives of the inhabitants were not to be sacrificed to perseverance misconstruction or wilful misrepresentation of the mother country. The use of elephants, and even of cavalry, was brought forward in support of the determination, and the doctrine laid down by a dissenter, 277 p. 417, that if the cause and end of war be justifiable, all the means that appear necessary to that end are justifiable also, was quoted.

At length, after several delays, the commissioner, who had been despatched to the Havannah, arrived at Montego Bay on the 14th of December with forty chasseurs, or Spanish hunters, chiefly people of colour, and about 100 Spanish dogs.

When these new allies were landed, the wild and formidable appearance of the men and dogs spread terror through the place. The streets were cleared, the doors were shut, not a negro ventured to stir out, as the muzzled dogs, fiercely making at every object, and dragging forward the chasseurs, who with difficulty held them in with heavy rattling chains and onlookers.

Dallas, in his history of the Maroons, gives the following account of their first appearance before the commander-in-chief:—'Anxious to review the chasseurs, General Walpole set head-quarters the morning after they were landed, before day-break, and arrived in a small boat, accompanied by Colonel Skinner, whom he appointed to conduct the intended attack. Notice of his coming having preceded him, a parade of the chasseurs was ordered; and they were taken to a disbanding place, to be advanced when the general alighted. On his arrival, the commissioner having paid his respects, was desired to parade them. The Spaniards soon appeared at the end of a gentle ascent, drawn out in a line containing upwards of forty men, then in three or four columns, and then in a long file. On receiving the command 'fire' they discharged their fusils and advanced as upon a real attack. This was intended to ascertain what effect would be produced on the dogs if engaged under a fire of the Maroons. The volley was no sooner discharged than the doors of the houses opened, the greatest fury, amid the shouts of the Spaniards, who were dragged on by them with irresistible force. Some of the dogs maddened by the shout of attack, while held back by the ropes, seized on the stocks of the guns in the hands of their keepers, and tore pieces out of them. Their impetuosity was so great that they were with difficulty stopped before they reached the general, who found it necessary to get expeditiously into the chaise from which he had alighted; and if the most strenuous exertions had not been made to restrain them, they would most certainly have seized upon his horses.'

This scene was well got up, and it had its effect. General Walpole was ordered to advance on the 14th of January following, with his Spanish dogs in the rear. Their fame, however, had reached the Maroons, and the general had penetrated but a short way into the woods when a supplication for mercy was brought from the enemy, and 260 of them soon afterwards surrendered on no other condition than a promise of their lives. 'It is pleasing to observe,' says Bryan Edwards, 'that not a man was killed after the dogs arrived in the island.' The war, as is well known, terminated with the expatriation of the Maroons in June, 1756, to Halifax in North America.

It is stated that these dogs, when properly trained, will not kill or harm the pursued unless they are resisted. On reaching a fugitive they bark at him till he stops, and then

No. 273.  

[THE PENNY CYCLOPAEDIA.]  

Vol. V. — C
couch near him, terrifying him with a ferocious growling if he stirs. They then bark at intervals to give notice to the chasseurs, till they come up and secure their prisoner. Each chasseur is obliged to have three dogs, though he hunts with two only, and these he maintains at his own expense: he lives with his dogs, and is inseparable from them. At home they are kept chained, and when walking with their masters are never unmuzzled or slipped from their ropes, except for attack. One or two small dogs called finders, whose scent is very keen at hitting off a track, accompany them. Dogs and bitches hunt equally well, and the chasseurs rear no more than will supply the required number. Though the breed is said not to be so prolific as the commoner varieties of the dog, it is stated to be infinitely stronger and hardier. It is described as of the size of the largest hound, with erect ears, which are usually cropped at the points, with the nose rather pointed, but widening much towards the hinder part of the jaw. The skin and coat, it is added, are much harder than those of most dogs, and it is said that the severe correction which they undergo in training would almost kill any other description of dog; this, however, may be doubted. There are some whose nose is more obtuse, and whose frame in general is more square, and these it is thought have been crossed with the mastiff, but if the bulk of the animal has been a little increased by the cross, it is not considered that the mixture has added anything to the strength, height, beauty, or agility of the native breed. [See Mastiff.]

Bryan Edwards, in a note to his appendix, gives a very different account of these Cuban blood-hounds:—"Though these dogs," he observes, "are not in general larger than the shepherd's dogs in Great Britain (which in truth they much resemble), they were represented as equal to the mastiff in bulk, to the bulldog in courage, to the blood-hound in scent, and to the greyhound in agility. If entire credence had been given to the description that was transmitted through the country of this extraordinary animal, it might have been supposed that the Spaniards had obtained the antient and genuine breed of Cerberus himself, the many-headed monster that guarded the infernal regions." Dallas, who had his information from the commissioner himself, William Dawes Quarrell, to whom his work is dedicated, gives a description and representation of one of these.

Spanish chasseurs with his dogs; and he relates the following instances of the strength and determined ferocity of the latter.

'The party had scarcely erected their huts when the barking of a dog was heard near them. They got immediately under arms, and, proceeding in the direction of the sound, discovered a negro endeavouring to make his escape. One of the Spanish dogs was sent after him. On coming up, the negro cut him twice with his muschet,* on which the dog seized him by the nape of the neck and secured him. He proved to be a runaway, said that he and the other negroes had deserted the Maroons a few days before, and that the party was at a great distance from the town, but that he would conduct them to it by noon next day.

In the next anecdote recorded by Dallas, the attack was fatal both to the unhappy object of it and to the dog. One of the dogs that had been unmuzzled to drink when there was not the least apprehension of any mischief, went up to an old woman, who was sitting attending to a pot in which she was preparing a mess. The dog smelled at it and was troublesome; this provoked her; she took up a stick and began to beat him, on which he seized on her throat, which he would not let go till his head was severed from his body by his master. The windpipe of the woman being much too short, she could not be saved.

When there is such discrepancy it becomes interesting to ascertain what the Cuban blood-hound is really like. A dog and a bitch, said to be of the true breed, were lately brought to this country, where, soon after their arrival, the bitch littered ten pups, one of them deformed. Here, at least, the statement that the Cuban blood-hound is not so prolific as the common dog was not borne out. Some of these pups we have seen, and we are enabled to give a description and figure of the variety. They are shorter on their legs than the English variety; the muzzle is shorter, and the animal is altogether smaller, with less of the hound about it than the English blood-hound has; the height is about two feet; the colour generally tawny, with black about the muzzle, or brindled like some of the Bandogs. They show great attachment, and are very gentle till seriously provoked, and then their ferocity is alarming.

[Cuban blood-hound.]†

In Cuba, the common employment of these dogs was to traverse the country in pursuit of murderers and other felons, and an extraordinary proof of their activity is recorded by Dallas, who states that the event occurred about a month before the arrival of the commissioner at the Havanna. A fleet from Jamaica, under convoy to Great Britain, passing through the Gulf of Mexico, beat up on the north side of Cuba. One of the ships, manned with foreigners, chiefly renegado Spaniards, being a dull sailor, and consequently lagging astern, standing in with the land at night, was run on shore, the captain, officers, and the few British hands on board murdered, and the vessel plundered by the Spanish renegades. The part of the coast on which the ship was stranded being wild and unfrequented, the

* A long straight muschet, or couloir, longer than a dragoon's sword, and twice as thick; something like a flat iron bar sharpened at the lower end, of which about eighteen inches are as sharp as a razor. The point is not unlike the old Roman sword. Such is Dallas's description of the chasseur's muschet.

† Our drawing was taken from a dog which had not attained its full growth.
assassins retired with their booty to the mountains, intending to penetrate through the woods to some remote settlements on the south side, where they hoped to secure themselves and elude all pursuit. Early intelligence of the crime, however, had been conveyed to the Hayvanna, and the assassins were pursued by a detachment of twelve of the chasseurs del Roy with their dogs. In a few days the criminals were all brought in and executed, not one of them being in the least hurt by the dogs when captured.

**African Blood-hounds.**—On his return from Africa, the late Colonel Denham, then major, presented two dogs and a bitch of this variety to the royal menagerie in the Tower, which, under the care of the keeper, Mr. Cops, then contained a very choice collection of animals, recorded in that interesting publication, The Tower Menagerie, London, 8vo. 1829. The Major informed Mr. Cops that with them he hunted the gazelle, and that they displayed great cunning, frequently quitting the circuitous line of scent for the purpose of cutting off a double, and recovering the scent again with ease. They would hit off and follow a scent after a lapse of two hours from the time when the animal had been on the spot, and this delicacy of nose had not escaped observation, for they were applied to nearly the same purposes as the various varieties here mentioned, and were commonly employed in Africa to trace a flying enemy to his retreat. It is well remarked in the work just alluded to that for symmetry and action they were perfect models, and a regret is expressed that, in consequence of their not having shown any disposition to perpetuate their race, though they had, at the time of making the observation, been three years in England, there appeared to be no chance of crossing our pointers with this breed. We agree with the writer in thinking that this blood so introduced would be a very valuable acquisition. It was remarked that, of the three in the Tower, the males were very mild, but the female was of a very savage disposition.

---

**BLOOMFIELD, ROBERT.**

BLOOMFIELD, ROBERT, an English pastoral poet, the youngest of six children of George Bloomfield, a tailor at Huntington, a village near Bury St. Edmonds in Suffolk, where Robert was born, December 3, 1766. Having in early infancy lost his father, his mother obtained a scanty subsistence for her family by keeping a little school, in which he himself was educated. He repaired with difficulty affording him even necessary clothing; at the age of eleven he was hired in the neighbourhood as a farmer's boy; but being found too feebile for agricultural labour, he was placed with a relative in London to become a shoemaker. With this object in view, he spent much time in reading newspapers, and a few borrowed books of poetry, of which his favourite was Thomson's *Seasons,* he composed his beautiful rural poem 'The Farmer's Boy' in a poor garret, No. 14, Bell Alley, Coleman Street, whilst at work with six or seven others, who paid each a shilling a week for their lodging. The MS., after being refused by several London publishers, was printed under the patronage of Capel Lofti, Esq., in 1800; and the advertisement it produced was so general that, within three years after its publication, more than 26,000 copies were sold. The appearance of such refinement of taste and sentiment in the person of an indigent artisan, elicited general praise; but the extravagant and indiscriminate applause of Mr. Lofti may well be considered as more injurious to Bloomfield's reputation even than such contemptuous derision as that of Byron in *English Bards and Scotch Reviewers,* an edition which published the following year at Leipzig. At Paris a translation, entitled *Valet du Fermier,* was made by Etienne Alliard; one was also made into Italian; and in London appeared, in 1805, Agricola Fuer, poema Roberti Bloomfield celeberrinum, in versus Latine, recensuit, vel reeditavit, Gulielmo Cluweb, LL.B., a very clever effort in imitation of the **German.**

The fame of Bloomfield was increased by the subsequent publication of a *Rural Tales, Ballads, and Songs,* Good Tidings, or News from the Farm,* 'Wild Flowers,* and 'Wild Hares, or Hints of the Wye.' He was kindly noticed by the Duke of Grafton, by whose influence he was appointed to the Seal Office; but suffering from constitutional ill-health, he returned to his trade of ladies' shoemaker, to which, being an amateur in music, he added the employment of making Ethiopian harps. A pension of a shilling a day was still allowed him by the Duke; yet having now, besides his wife and children, undertaken to support several other members of his family, he became involved in difficulties; and, being habitually in bad health, he retired to the Row, and in 1816, a subscription, headed by the Duke of Grafton, was opened in his behalf. He died at a private residence of Sir Egerton Brydges, for the relief of his embarrassments. Great anxiety of mind, occasioned by accumulated misfortunes and losses, with violent incessant headaches, a morbid nervous irritability, and loss of memory, reduced him to great poverty, and just before his death he removed to a modest cottage at the Green in Ealing. Charles, Sept. 19th, 1823, at the age of fifty-seven, leaving a widow and four children, and debts to the amount of 200l., which sum was raised by subscription among his benevolent friends and admirers. In the following year, at the sale of his MSS., that of 'The Farmer's Boy,' in his own hand-writing, was sold for 14l.

The works of Bloomfield have been published in 2 vols. 12mo. 'Hathwic Hall,' which appeared a short time before his death, has little merit in comparison with his earlier productions. In 'Remains of Suffolk,' Anecdotes, Remarks on *Ethiopian Harps, Tour on the Wye,* &c., were edited by J. Weston, Esq., 1824. The 'Farmer's Boy,' 'Wild Flowers,' with several of the 'Ballads and Tales,' are his best poems; and many critics, such as James Montgomery, Dr. Nathan Drake, and Sir Egerton Brydges, have expressed the highest admiration of their chaste and unaffected beauties. The author's amiable disposition and benevolence pervade the whole of his compositions. There is an artless simplicity, a virtuous rectitude of sentiment, an exquisite sensibility to the beautiful, which cannot fail to gratify every one who respects moral excellence and loves the delightful scenes of English country life. Those who are charmed only with lofty and obscure conceptions, or a pompous parade of words, will find nothing to their taste in the simple descriptive poetry of Robert Bloomfield.

BLOW-PIPE. The instrument to which his name has been applied, was originally employed by jewellers and others in the soldering of metals on the small scale, whence it derives its name in the German language 'Löthen,' from the two words 'löthen,' to solder, and 'rohr,' a tube or pipe. When used for such purposes it is constructed of a simple metallic tube seven or eight inches in length, the bore of which at the larger extremity is about one-fourth of an inch in diameter, and gradually contracts as it approaches the other, where it terminates in an almost capillary point; and it is fluted to facilitate the passage of this tube at a right angle at an inch or an inch and a half from its finer extremity. In this form it is used by the workman to direct the flame of a lamp on the portion of solder to be employed, by which he is enabled to bring it to a bright white heat, and melt the solder; the solder is placed on a fragment of charcoal, which he holds in his left hand, and upon which the flame is made to play by blowing a gentle current of air against it by means of the pipe.

The blow-pipe was its sole use until the year 1739, when, as we are informed by Bergman, Antony Swab, a Swedishbergman, or counsellor of mines, and a many of very considerable knowledge for his time, introduced it to the notice of the scientific world, by employing it in determining the nature of the metals in the various ores and minerals which came under his notice. Swab however wrote no works on the
subject, nor does it appear to have received any particular attention from any one until Cronstedt proposed his system of mineralogy, in which the arrangement is dependent on the chemical composition of the minerals. It thus became to him of vital importance for the general adoption of his system—we may almost say for its existence—for in order to determine the constituents of mineral bodies, as it was evident that those offered by the slow and laborious operations of chemical analysis could not be generally employed by mineralogists. This he found in the blow-pipe, and by the employment of fluxes in the experiments performed with this instrument, he may be considered as the founder of a new department of the chemical science. His results are to be found in his "System of Mineralogy," the first edition of which was published in 1758, and was translated into English by Von Engelcrumstrom and revised and corrected by Mendez de Costa, London, 1776. The employment of the blow-pipe in detecting the constituents of mineral bodies being thus brought into notice, excited the attention of the chemists and mineralogists to the cultivation of this branch of chemistry, and its application to chemical analysis and to the determination of the mineral species of Sweden. Such was its effect that still continue to have been studied with the greatest success; and it is to the chemists and mineralogists of Sweden that we are indebted for the greater portion of the information which has been received on this subject, and more particularly to Berzelius. But in further extending its limits by a series of original researches, in which he investigated the properties of most of the then known species of minerals, and by a more general application to chemical analysis, published the results of his observations in "Elements of Chemical Language," which appeared at Vienna in 1779 under the following title, "De Tubo Fertilizzatorio, ejusdemque usus in explorandis Corporibus, preserim Mineralibus." A translation of the above into English will be found in the second volume of Bergman's "Compendium of Mineralogy," London, 1828. Gahn, though indefatigable in his observations and experiments with the blow-pipe, and though far exceeding any of his predecessors both in the conception and execution of his experiments, has however left no work on the subject. As an instance of his power of detecting the presence of metallic bodies, we are told by Berzelius that he has often seen him extract from the ashes of a quarter of a sheet of paper distinct portions of copper, and that too before the knowledge of the occurrence of this metal in vegetables was generally known. After these things have been led from this circumstance to suspect its presence in paper. Although we cannot but feel regret at having received no work from a man so eminently qualified to instruct on this subject as Gahn, still we must consider ourselves most happy that under such circumstances the loss of the knowledge and experience of so long and laborious a life is not also to be lamented. Fortunately for science, accident, as it were, made Berzelius the medium through which this information was to be communicated to the world; and while he was in possession of the secret, he would at the same time have been happy to share another of the many benefits he has bestowed on mankind cannot but be envied, it must be universally felt and acknowledged that if he has been favoured by fortune he has proved himself one of the most worthy of her favour by the manner in which he has fulfilled the task assigned to him. The assiduity of Gahn in this study, together with the circumstances to which we are indebted for the preservation of his labours, cannot be better told than in the words of Berzelius himself. 'Gahn,' says he, 'was never without his blow-pipe, not even during his shortest journeys. Every new substance, or any thing with which he was not previously acquainted, was immediately submitted to an examination before the blow-pipe; and it was indeed an interesting sight to observe with what astonishing rapidity and certainty he was enabled to determine the nature of a body, from its appearance and exterior properties could not have been recognised. Through this constant habit of using the blow-pipe he was led to invent many improvements, and to make many conveniences, which he could have at hand whether at home or abroad: he examined the action of a number of re-agents, for the purpose of finding new methods of recognizing bodies, and this he did in such detail, and conducted his operations with such accuracy, that all his results may be relied upon with the greatest confidence. Nevertheless it never occurred to him to give a written description of his new or improved methods; he gave himself however all possible trouble to instruct all who were willing to learn, and many foreign men of science, who passed some time with him, have made known his great dexterity in this subject; but no one has communicated a perfect knowledge of his methods. I had the good fortune, during the last ten years of the life of this in many respects most remarkable man, to enjoy his most intimate acquaintance. He spared himself no trouble to communicate to me all the results of his experience, and I have consequently held it as a sacred duty to allow nothing of this experience and of his labours to be lostوء. Such then is the origin of Berzelius's treatise, a work which must be considered as the highest authority on this subject; and as there are translations in the English, French, and German languages, we cannot too highly recommend it to the study of those desirous of obtaining a more intimate acquaintance with the uses to which the blow-pipe may be applied. The English translation is however unfortunately taken from the first edition of the text; the title is 'The use of the Blowpipe in Chemical Analysis, and in the Examination of Minerals,' by J. J. Berzelius. Translated from the French of M. Fresnel, by J. G. Chilren, London, 1822. As our limits will not allow of our entering into the description of the phenomena presented by the different chemical elements and minerals, when experimented on by the blow-pipe, we must confine ourselves to a general description of the nature of the experiments performed by this instrument, and the conclusions to which it leads us in determining the chemical constitution of a mineral, and consequently in recognizing what species it belongs to. For this purpose it may be convenient to class the experiments under four heads:

1. The characteristic changes produced on bodies when exposed to a high temperature.
2. The oxidizing effect of the flame, and the reduction of metals from their ores.
3. The oxidizing effect, or the changes produced by the oxygen of the air on the body.
4. The action produced by the application of fluxes or re-agents.

The first three classes are dependent on the unsaid action of the blow-pipe flame, and as the total effect is produced by properties peculiar to particular parts of the flame even in the cases where fluxes are employed, it becomes a matter of less importance to possess a good knowledge of the flame itself, a description of which will therefore be first given. If a burning lamp or candle be carefully observed, it will be found that the flame may be divided into four parts, which may readily be distinguished from each other. Firstly, on the lower extremity of the flame, where it is in contact with the wick, will be seen a blue portion, which extends from the wick and terminates at the points of Fig. 1, where the boundaries of the flame assume a vertical direction. The second most striking part of the flame is the bright intensely luminous portion of Fig. 2, which rising as it were Fig. 1.

Fig. 2.

extends from the wick and terminates at the points.
From out of the cup produced by the blue, ascends in the
form of a cone. In close connexion with this cone will be
observed a smaller one a contained within it, of a dark
colour, and rising from the upper extremity of the wick; and
by a very careful examination it will be found that the outer
surface of the blue is surrounded by a thin coating of a
slightly luminous flame c, which may be the result of the
formation of the blue ring, and increases a little in thickness
as it approaches the upper extremity.

The three cones thus enveloping each other differ not
only in their appearance, but also in their temperature and
chemical properties; the outer cone, as was shown by Sir Hume-
phrey Davy in the course of his beautiful and philosophical
inquiries into its nature, which terminated with the disco-
very of his safety-lamp, is gaseous matter heated to white-
ness; its most striking properties are evidently its power of
comtan-
cing the air, and the length of time it remains in that state.
If therefore into a stream of
from the upper side of the flame, the air, by the heat
violently rendered more rapid, the temperature of the flame
will consequently rise, while its illuminating power dimin-
ishes, as will probably have been observed by many who
have seen the hydrocyanic gases, where the light is de-
creased in an instant, whatever the composition of the
air may be, and chalk, not from the
burning gases. On applying these to the common
flame, the existence of the three concentric cones will be
readily understood: in the interior cone, the inflammable
gases arising from the decomposition of the burning ma-
terials, supplied with oxygen, and therefore under a
more rapid combustion than the interior enclosed portions:
here therefore will be found the hottest points of the flame.
That such is really the fact may be proved experimentally,
by laying a piece of paper in contact with the edges of the
wire at different elevations in the flame, it will be found
that the portion of the outer cone immediately above e, the
upper edge of the blue cup, is the point of greatest heat.
In the most luminous cone the combustion is slower, and in
the interior darker portion, the gases have not yet come into
contact with the air, and are still unchanged.

If a fine current of air be now directed into the flame by
means of a jet of water, the same appearance seen
in fig. 2: in the centre of the flame, and immediately
proceeding from the orifice of the tube, a long and thin blue
portion in the position d e of the figure will be seen: this
must be with the blue cup of the natural flame. But it
was in the upper edge of this cup, in which were found the
points of greatest heat, and the same is true here also, with
this difference however, that while in the natural flame
these points were spread over a considerable circle, c c, in
the blow-pipe flame they are all collected into the one point
c which remains constant at the same temperature.
The reason therefore of the high temperature which may
be produced by the blow-pipe is the result of the concentra-
tion of the hottest points of the flame into a focus; and
other circumstances tends also to heighten this effect, that
while in the natural flame the highest points of the flame
are relatively near the outer boundaries, and are therefore rapidly robbed
of their temperature, they here occur encased by the luminous
flame which thus protects them against the loss of tem-
perature from this cause.

The gas thus produced by the workman in the soldering of
metals, and constructed as was first described, cannot be
employed in these operations, owing to the collection of the
water from the condensed moisture of the breath on con-
taining the blow any time. This inconvenience is avoided by
the slow rate of combustion, and this should not be a serious
inconvenience between these as a receptacle for retaining the water, which is
thus prevented from entering into the finer part of the pipe
where it would obstruct the current of air. In using the
blow-pipe the operator must not employ his lungs in pro-
ducing the current of air, as it would not only be destruc-
tive to his health, but he would be unable to sustain the
blow a sufficient length of time to ensure the necessary
effects: it is produced by inflating the mouth with air,
which is then forced through the tube by contracting the
muscles of the cheek, and by a little practice the blast
may be thus sustained for a considerable time, the pro-
cess of respiration being unaffected, the only inconvenience
being arising from the dislike of the operation of the cheek from
their unusual exercise. The power of being able to per-
form this depends on the individual being able to keep
his mouth inflamed while he respires. After this has been
learnt, some little experience will be required to enable the
operator or surgeon to judge the strength of the blast, so as to
produce the most powerful heat, as it must be neither too
strong nor too weak; in the first case the heat is diminished
in its action by an excess of air, and in the second too feeble
a flame is produced.

The experiments themselves to which the
pipe may be applied, and we commence with those
which fall under the first class. The changes produced
on a body when exposed to a high temperature. Of these,
four are particularly worthy of notice:

1. Its fissility.
2. The changes produced in its colour.
3. The volatilization of the substance under examination.
4. The volatilization of one or more of its component parts.

When the various elements or their compounds, which
occupy a place in the table of elements, are exposed to the
heat alone can here be considered, are exposed to heat, there is
always evidence of a force tending to overcome that cohesion
of their particles to which they owe their solid form, and it is
believed that by a sufficient degree of temperature any
matter may be decomposed, whether by means of the cold, of
either immediately or through the intermediate stage of
fluidity. However this may be, it is well known that the
temperature at which such changes are effected varies with
each element, and the point which the blow-pipe first
forms upon us is, what is intended by this blow-pipe to
be produced by means of the cold, or at least by the
least heat? Whether it be by the ordinary means of heat,
natural or artificial, or by the heat of the vessel in which
the vessel is heated, and the vessel is the one under consid-
eration will be found. Nor is this mere fact the sole guide
to our knowledge of the changes of which any body is capable
or difficulty with which the change is effected, the charac-
ters of the substance in its changed form, the appearance
it assumes on being again allowed to cool, open to us new
sources of information, and each must be carefully observed.

Thus in some minerals the fusion is produced with ease;
in others again it can only be effected slowly and by the
strongest heat we can produce; while in a third case our
efforts will only be sufficient to round off the sharp edge of
a fine fragment.

But these are by no means the most of the important changes,
the relations of the elements to oxygen gas being decidedly
more interesting and instructive. When any substance
combines with oxygen gas it is said to be oxidized, and
whenever a compound of oxygen with any base loses oxygen,
it is said to be deoxidized or reduced to a lower state of
oxidation, according as it has lost the whole or a part of its
oxygen. Most bodies, and particularly all the metals, are
liable to undergoing the one or the other of these changes;
and as by means of the blow-pipe we have it in our power to
produce the highest temperature of which the blow-pipe is
capable of being oxidized, as well as those which are favourable
to its reduction, should it be present in the form of an oxide;
and as these changes are usually accompanied with striking
characteristic phenomena, the blow-pipe is thus the
most valuable instrument in the hands of the chemist to
examine the presence of metals, which may in many cases be extracted in their perfect
metallic form from the smallest fragment of their ore.

The oxidation will be produced by holding the body
before the outer extremity of the flame, where the elements
are being heated but the air is well stirred, and in the
place in the most favourable circumstances for combining
with it. This takes place the more readily the further
the ass is held from the flame, provided a sufficient tem-
perature is at the same time obtained; nor is it necessary
that there should be a focus of heat, since the preliminary
advantage, particularly when the support is of charcoal.
This process will be best performed with a pipe of compara-
tively large orifice, and when the material is kept at a
low red heat.

The deoxidation or reduction requires a small orifice,
and the substance under examination should be as much as
possible surrounded by the luminous flame, by which means it is cut off from contact with the atmospheric oxygen, and is surrounded with a glowing combustible gas, by which it is deprived of its oxygen. In performing this operation, which is infinitely more difficult than that of oxidation, particular attention must be paid to keep the asay constantly in the state of the same, and in the presence of the charcoal on which the substance rests. Berzelius recommends the beginner to practice himself in the reduction of metals by fusing small grains of tin on charcoal, and to endeavour to keep it in that state without allowing its surface to lose metallic glint, which it does owing to the formation of the oxide; the instant it is removed from the deoxidizing flame. This operation should first be attempted on very small fragments, as the difficulty increases with the size of the tin grains.

One solution of the experiments in which fluxes are employed, the most important of which and their uses will be briefly described. They are, carbonate of soda, borate of soda, double phosphorus of soda and ammonium, saltpetre, boracic acid, bisulphate of potash, gyps, fluor-spar, nitrate of cobalt, tin, iron, lead. Of these the first three only are of general use, while the others are employed to test the presence of particular bodies: we shall confine our attention therefore to the former, as to touch upon the particular cases in which the others may be advantageous would not lead us too far. We shall confine ourselves to those pertaining to the chemical description of the properties of these bodies.

Care should be taken that the carbonate of soda employed for these experiments be free from any impurities, particularly from the sulphate. The purest which can be purchased is that of common use among chemists; if this cannot be obtained, a saturated solution of the ordinary carbonate should be taken, through which a current of carbonic acid must be transmitted, when the bicarbonate will be precipitated in the form of fine grains, which must be washed with cold water, and dried. It is purified for such use by means of the blow-pipe itself in the following manner. Let a glass be formed by fusing a portion of the carbonate of soda with a small quantity of pure silica, and let the resulting glass be well acted on by the deoxidizing flame. If on cooling it retains its colourless condition, the soda may be considered free from sulphuretted gases; but the presence of which would be indicated by the glass assuming a yellow passing into a hyacinth-red colour, owing to the presence of the liver of sulphur. The application of soda answers two purposes: to determine whether the body is fusible in it as a flux, and to secure that of the reduction of metals.

The soda is best applied by mixing it with powder with the substance to be examined, which should also be in powder; the mixture is formed into a paste by the addition of a little water, a small portion of which must then be placed on the charcol, and the mixture brought to a state of fusion. It is usual for the soda, as soon as it is fused, to be entirely absorbed by the charcoal, but it is not on that account less active: a continued effervescence is observed on the substance under examination, and its fusibility is indicated by the formation of a glass globule. But the greatest use of soda is decidedly in promoting the reduction of metals, which it does in a most unaccountable manner. If a small quantity of the oxide of tin be placed on the charcoal, a dextorous blower, at some expense of time, will be able to obtain a small bubble of metallic tin. If however a little carbonate of soda be added to the oxide of tin, the reduction is effected with case and rapidity.

The influence of the soda in this operation is not understood, but it is constant; and Gahn has given the following process, by which the metals platinum, gold, silver, molybdenum, tungsten, antimony, tellurium, bismuth, tin, lead, copper, nickel, cobalt, and iron may be obtained, and consequently their presence detected, whenever this is possible.

The assay is reduced to powder, and formed as before into a paste with the moistened soda: this must then be placed on the charcoal, and submitted to the action of a good deoxidizing flame. After some time an additional quantity of soda is added, and the blast renewed, and this process must be repeated until the whole of the assay is absorbed by the charcoal. When this is entirely effected, those portions of the charcoal which have thus become saturated with soda, must be moistened by a few drops of water, and they must then be carefully removed with a knife and reduced to powder in an agate mortar. This must then be washed, by which the fine and light particles of charcoal may be readily removed from the metallic particles, which, if any be present, will be found in a pure metallic form in the mortar. The form in which the metal will be found depends on its fusibility and malleability: should it remain fusible, it will be difficult to separate from the little remains of metallic glint, which it forms owing to the formation of the oxide; the instant it is removed from the deoxidizing flame. This operation should first be attempted on very small fragments, as the difficulty increases with the size of the tin grains.

One solution of the experiments in which fluxes are employed either in the form of small grains, or of powder, or it may be first fused to free it from its water of crystallization. The advantages of its use in the blow-pipe are dependent on its forming a most powerful flux, by which a number of otherwise refractory substances may readily be brought into a state of fusion. It is usual, in the first place, to endeavour to fuse a small fragment of the assay; as, if this process be successful, we are able to observe the phenomena taking place during the fusing better than when it is subjected to the action of the blow-pipe. It is considerably more important, we see whether the assay is partially or entirely fusible in this flux. The principal facts to be observed are, whether the fusion is accompanied with effervescence, or whether it takes place tranquilly; to examine the colour of the gas, and to observe how readily the glass is formed if the oxide of the metal is converted into silicic oxide; the colour of the resulting glass, and also to observe whether any changes take place either in the glass or transparency of the glass as it cools.

The phosphoric salt, to use the term by which it is usually designated in works on this subject, is a double salt of phosphoric acid and sodium, and appears, when best prepared, according to Berzelius, by adding to a solution of 16 parts of chlorate of ammonia in a small quantity of boiling water 100 parts of crystallized phosphate of soda: this latter must then be brought also to a state of solution over the fire, and the whole then filtered, and then be allowed to cool slowly, when the double salt will be deposited as crystals. It may be considered as pure if the crystals when fused give a glass, which does not become opaque on cooling. The object of this salt is to enable us to try the action of a free and strong acid on the assay, which is best obtained by this means, as on heating the ammonia is driven off, and the acid with which it was combined is then at liberty to exercise its influence on the body tested. It is therefore a powerful agent in proving the presence of the metallic acid, and is distinguished by a very particular colour of the coloured salts; and it is also a good test for determining the presence of silica in minerals, the phosphoric acid depriving it of the bases with which it was combined, and presenting it in the form of a glistening substance.

It now only remains once more to call the attention of all our readers, who may be in any way engaged in any manufacture dependent on the applications of chemistry, to the great advantages to be derived from the possession of some skill in the use of this little instrument. For instance, of all the advantages which a manufacturer is able to obtain, by him, at the cost of a few minutes, to prove the absence of impurities in the medicines he purchases—to the chemical manufacturer, to the dyer, the miner, the assayer. Nor are there any difficulties arising from the size or expense of the instrument, for it can be carried in the pocket, and might be conveniently carried in the pocket. Nor is the requisite knowledge difficult of acquirement; nor need the individual, in order to be able to employ this instrument in a manner practically useful to himself, be a scientific chemist; it is only necessary to be able to understand a particular part of a science, another to extend it by discovery.

BLUBBER. [See Whale-Fishery.]

BLÜCHER, LEBRECHT YON, prince of Wahlstatt, field-marshal of the king of Prussia, was born Dec. 16th, 1742, at Rostock, a town near the shore of the Baltic, in the duchy of Mecklenburg-Schwerin. His father was a captain of cavalry in the service of Hesse Cassel. At an early age he manifested a strong predilection for the military profession and, in opposition to the advice of his relatives, entered, in his fourteenth year, a regiment of Swedish
in a campaign against the Prussians, at the commencement of the Seven years' war, in which the Swedes were allied with Russia and Austria against France. With the exception of the capitulation of Halm, on the river Berin, by the same regiment of Prussian hussars in which he afterwards became so distinguished. The colonel of the regiment, Von Belling, being favourably impressed with his frank and gallant character, persuaded him to join the Prussians, which he did, and he was immediately afterwards commissioned captain of acompany of another Swedish officer. In the service of Frederic he rose from a lieutenant to senior-captain, when his pride being ruffled by the promotion of a person of higher birth than himself to the vacant post of major, and finding no use made of him, he caused himself to be left to resign, to be delivered to his royal master—that singular personage, to whom in stoical endurance of hardships and energy of character he was so remarkably similar. The reply of the king was—"Captain Blücher, his permission to quit my service, and may go to the devil if he thinks fit." Upon receiving this unexpected civility he retired to the duchy of Silesia, became a farmer, and by persevering assiduity acquired possession of a considerable estate. He remained thus employed for fifteen years, until the accession, in 1786, of Frederic William II., by whom he was courteously recalled, and again introduced in the rank of major to his old regiment of black hussars, which he commanded with honourable distinction in several campaigns against the French.

In 1789 he obtained the Order of Merit; and subsequently the hereditary order of the Medusa, with the title of Grand Cross of the Order of the Medusa, the bar of Oriches, Luxemburg, Frankenstein, Oppenheim, Kirchweiler, and Eidesheim in the palatinate, he acquired reputation as a soldier by his vigilance, promptitude, and astonishing energy. In the name of the king of Prussia he was put in command of the division of Eichstatt, the same year, after the victory gained by the French at Jena, having, with a remnant of 10,000 or 12,000 Prussians, become separated from the rear, he succeeded without disorder in forcing his retreat westward as far as Lubeck, and, though harassed by the pursuit of the marshals Soult, Murat, and Bonaparte, he adhered to the last, and finally captured a capital only on condition that the cause of surrender should in writing be stated to be want of ammunition and provisions. Whilst a prisoner of war he was treated by Napoleon with a courtesy and politeness for which the motive could not be misunderstood; but the name of Blücher never appeared among those Prussian officers who consented to serve the emperor in his projects against Russia. Having been exchanged for General Victor, he was sent in February to Austria to assist in the operations of the Austrian army, employed in the imperial department at Königsberg and Berlin; and when in 1813 his country rose in opposition to France, he was appointed to take the command of a numerous army of Prussians and Russians combined. The order of St. George was bestowed upon him by the emperor Alexander in acknowledgement of his victory at the battle of Lützen; at those of Bautzen and Haynau he was less conspicuous. In the battle fought August 26th, 1813, on the banks of a small river near Liegnitz in Silesia, called the Katzbach, Blücher first held undivided command; and with 50,000 men, the largest portion but raw militia, defeated the French marshals Macdonald, Ney, Lauriston, and Sebastiani. In consequence of a heavy rain during the four previous days, a great number of muskets were not useable; the infantry were therefore brought hand to hand with thebayonets, and the infantry of the French were completely taken by surprise. Blücher gained the first great victory of that eventful campaign by a furious attack that precipitated the French by thousands into the flooded river. The general's proclamation upon this occasion exhibits his characteristic fervour and laconic eloquence—"Silesia is delivered! audaciously the enemy came upon you—brave soldiers! swift as the lightning you rushed upon them—your bayonets have plunged them headlong into the Katzbach—you have 16,000 prisoners and all their baggage—offer thanks to the God of victors for the providence of his holy aid. The necessity for the extreme difficulty to the Elbe, passed over by means of pontoons, and pushed on to the important battle of Leipzig, to the victorious results of which his services greatly contributed. With his Russo-Prussian troops he now formed the left wing of the greater army of the allies, and was engaged in treating towards France. Having passed over the Rhine at Kau and Coblenz, he took possession of Nancy in January, 1814. At Brienne he received a fierce attack from Napoleon; but, though repulsed with great loss, returned to the combat, as usual, on the following day, and succeeded in getting some advantage. The rash and reckless charge of the French, with the usual voice, was obliged him to make a retreat, and exposed his army to attacks which prudence might have avoided, an alarm began to rise in England about the final result of the contest; when, after various battles lost and won on the way to Hanover, which he had been pleased from Prussia to adorn the Louvre. As field-marshall and prince of Waldburg, he accompanied the allied sovereigns to England, where his personal appearance excited intense curiosity. All the most illustrious military orders of Europe having already been conferred upon him, the king of Prussia created for him a new one, with the badge of a cross of iron, in compliment to his invincible courage. The Prince Regent of England gave him his portrait; and the university of Oxford, not to be deficient in proof of admiration, bestowed upon the veteran warrior the academical degree of LL.D. In possession of these honours he retired to his Silesian estate, residing there until the return of Napoleon from Elba in 1815, when again he returned to the great theatre of war, and assumed the command of the Prussian army in Belgium. His character of a frequent and incipient enemy occasioned his defeat at the battle of Ligny, June 16th. This was the close of this desperate engagement, in which the fighting continued until ten at night, that his horse was shot dead, and fell upon him, so that he lay in that position unable to move, several French cuirassiers passed over him in charging his troops of cavalry; his aide-de-camp was soon in circulation; and Napoleon, who commonly named him le vieux diable (the old devil), made the most of it in cheering the hopes of his soldiers in the struggle at Waterloo on the 18th. He wrote to Wellington that night in the evening of that memorable day, when victory seemed to be on their side: "Blücher, who on the night of his accident had, owing to the darkness, escaped unhurt, appeared suddenly emerging from the forest of Frichemont at the head of a great portion of his army; and it is said that Marshal Ney was so elated by this news that his troops had been marching all day, immediately gave orders to pursue the flying enemy; and the moon being bright, a fierce and hot pursuit by sixteen regiments of Prussians kept up all night, until the roads were choked with the dying and the dead. Blücher and his army at Paris, and assisted in the reinstatement of the Bourbon dynasty, he remained there several months, very frequently attending the tables for rouge et noir. When the Prussians returned to Germany, Blücher, on the anniversary of the battle of Katzbach, paid a visit to Rostock, his native place, where all the inhabitants united to raise a public monument to his fame: those of Berlin presented to him a medal with a representation of the angel Raphael carrying with him a dragon. His health now beginning to decline, he finally retired to his residence in Silesia, where the king of Prussia visited and took leave of him in his latest moments. 'I know I shall die,' said the old general; 'I am not sorry for it, because I can be no longer a burden to you.' Having requested that he might be buried without any parade, in a deep grave, by the roadside, under three linden trees, he died on the 12th of September, 1819, aged 77. The whole army went in mourning for eight days. He had been in the service of Prussia for forty years. The battle of Waterloo was at the age of 72. In the year 1826 his remains were removed to the Hohenzollern Road, 500 feet in height, modelled by the sculptor Rauch, was erected in Berlin. The merit of Blücher lay nearly altogether in his fearless courage and his personal advantages: as a prussian, scientific, general he has no claims at all to distinction. With a piercing eye he could perceive a difference of figure, accoutred and armed as a cossack, and a masterly style of manoeuvring his horse, his presence, as he rode in front of his men, never failed to inspire them with hope of
success in following a caption so daring and full of energy.

The astonishing celebrity of his movements got him the appointment of Marshal Forwards, by which he was generally known in Germany and Russia; but equally well known was the fact, that to the able plans of General Gneisenau, one of his officers, he owed almost all his success.

BLUE, as a pigment. The substances used for this purpose are of very different natures, and derived from various sources: they are all compound bodies, some are natural and others artificial. They are derived almost entirely from the vegetable and mineral kingdoms, though the first which we shall describe is partly prepared from animal matter, viz. —

**Prussian Blue.**—This beautiful pigment was discovered by accident in 1710 by Diesbach, a manufacturer of Berlin; but the method of preparing it was first described by Woodward in the Philosophical Transactions of 1744. The first step in the operation is to calculate a mixture of potash or its carbonate, with animal matter that contains azote, as blood, hoofs, or horns, in an iron vessel, till it ceases to burn with flame. The residual matter is then suffered to cool, the soluble portion of it dissolved in water, and the solution when sufficiently concentrated yields fine yellow crystals on cooling. This salt was formerly called phlogisticated alkali, and triple prussiate of potash: according to Berzelius it is a double cyanide of potassium and iron, consisting of:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Formula</th>
<th>Molecular Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cyanide of potassium</td>
<td>. . .</td>
<td>62.</td>
</tr>
<tr>
<td>Iron</td>
<td>. . .</td>
<td>25.3</td>
</tr>
<tr>
<td>Water</td>
<td>. . .</td>
<td>12.7</td>
</tr>
</tbody>
</table>

When a solution of this salt is poured into one of proto- sulphate of iron a perfectly white precipitate is formed, provided no persulphate be present; but if there is, then the precipitate is of a bluish grey colour; in both cases it becomes water soluble on the air, of a fine blue, and is then washed and dried for use. In this precipitation and by a complicated play of affinities the potassium is replaced by iron, and the Prussian blue procured consists nearly of:

</tr>
</tbody>
</table>

Very commonly the solution of cyanide of potassium and iron, procured from the residue of the calculation, is not put to crystallize, but is added at once to the solution of sulphate of iron. In this case, on account of the excess of potash which it contains, a portion of iron in a state of oxide is precipitated uncombined with the colouring matter; in order to prevent this from injuring the colour of the pigment, either dilute sulphuric acid or a salt of nitric acid is added, which dissolves it without acting on the Prussian blue; or alum is mixed with the sulphate of iron, and the combined potash uniting with its sulphuric acid, alumina is precipitated instead of oxide of iron, which merely dilutes without otherwise injuring the colour of the product. When a solution of a persalt of iron, such as the nitrate, is used, the precipitate is immediately obtained of a fine blue; but this process does not answer in manufacturing.

Prussian blue is inodorous, tasteless, insoluble in water, and readily soluble in alcohol. It is hygroscopic, attracting water strongly from the air, which it retains until heated to nearly 280°. Diluted acids do not act upon this substance, but strong sulphuric acid dissolves it, forming a white compound similar to that of starch and water in appearance. On the addition of water the blue colour is restored. Nitric acid and muriatic acid, when concentrated, both decompose it, and the same effect is produced by the alkalis and alkaline earths, but with different results. It is also decomposed by a strong heat. Prussian blue is employed both as a water colour and in oil; in the latter case, on account of the deficiency of what is termed body, it is usually mixed with white lead, and it will bear admixture with a large portion of this on account of the intensity of its colour. Its stability is very considerable, and it is not only used as a pigment, but also as a dye. According to Klaproth, as it was used in Sweden instead of smalt, to give writing-paper a blue tint, but the paper was found to acquire a disagreeable greenish hue.

**Indigo.**—This fine blue is extracted from different species of **Indigofera** in the East Indies and Guustralian in South America, of which the latter is most esteemed. For the methods of procuring the colour from the plant and the various substances with which it is mixed, we refer to the article **Indigo**, here merely stating the properties of the blue pigment usually met with by that name in small cubic pieces. The colour is extremely deep, the fracture is earthy, but becomes brilliant and of a copper red when heated to a red heat. It dissolves easily in water to a very great degree to which this effect is produced, the better is the indigo reckoned. Even in this state however it is mixed with some foreign matters, which may generally be separated by water, alcohol, solution of potash and dilute acid, in all of which pure indigo is insoluble. It may also be purified by sublimation, but the process is difficult of management, for if the heat be rather greater than necessary the indigo is decomposed. Another method of procuring pure indigo is to take the solution of indigo prepared by dyers, and agitate it in concentrated sulphuric acid. This solution when mixed with blue indigo in powder with lime and a solution of protosulphate of iron; the lime decomposes the sulphate of iron, precipitating its protoxide; this acting upon the indigo takes oxygen from it, and then it is rendered colourless and also soluble in water by the action of the excess of lime; this solution when agitated with atmospheric air, the indigo regaining oxygen and colour, is precipitated, and when washed with a little dilute muriatic acid and dried, it is pure Indigo, except when used as a water-colour, requires white lead to give it body, it is a colour of considerable permanency. Strong nitric acid decomposes it, but it differs from most vegetable products, and especially vegetable colours, in being perfectly soluble and without decomposition in concentrated sulphuric acid. The colour is most intense, and this solution is employed in dyeing as Indigo Blue. Chemists are not agreed as to the exact nature of this solution. Chlorine immediately destroys the colour of indigo.

**Blue Verditer.**—This pigment is used as a water-colour, and also procured from the manufacture of the green earth. It is a greyish powdered of a very fine light blue. It is a carbonate of copper, composed of nearly:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Formula</th>
<th>Molecular Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peroxide of copper</td>
<td>. . .</td>
<td>70.</td>
</tr>

<td>Water</td>
<td>. . .</td>
<td>4.6</td>
</tr>
</tbody>
</table>

It is prepared by precipitation from the solution of nitrate of copper which results from the refining of silver by precipitating the silver by copper sulphate. The operation is not generally known, and success probably depends upon some minute circumstance in the manipulation.

This colour is readily acted upon by the acids even in their dilute state; they evolve its carbonic acid, and dissolve the peroxide of copper, which decomposes the oxide of iron and lime water, combine with the carbonic acid, and separate peroxide of copper; it is blackened by sulphurated hydrogen, and it is decomposed at a high temperature. It is used exclusively, prepared from a mineral called Azure Stone, or Lapis Lazuli, the finest kinds of which are brought from China, Persia, and Great Bacteria. In the 8th vol. of the *Annales de Chimie*, M. Tassart has noticed the accidental discovery of ultra-marine in a furnace used for the manufacture of soda; and about the year 1826, M. Gmelin of Tiibingen, and M. Guimet of Lyons, both succeeded in forming this colour artificially, and it is now prepared in large quantity, of quality equal to the natural product. The former of these chemists has given the following directions for making this pigment, and he asserts that it will infallibly succeed:—Prepare hydrate of silica and alumina, the first by fusing powdered quartz with four times its weight of carbonate of potash, dissolving the fused mass in water and precipitating the silice by muriatic acid; the second by decomposing a solution of alum with ammonia. Wash these two earths carefully with boiling water; and by drying portions of the most precipitates, ascertain the quantity of dry earths which they contain. Then dissolve as much of the hydrate of silica as is necessary to prepare the above quantity of dry earths. Add the solution of indigo to the above quantities of hydrated silica and alumina, and evaporate constantly stirring till the residue is nearly dry: this is the basis of the colour. Put into a Hessian crucible, which has a cover that fits closely, a mixture of two parts of sulphar and one part of—
hydrous carbonate of soda; cover and heat the mixture moderately till it fuses; then gradually throw in small portions of the mixture above described, waiting till the effervescence is over before a fresh portion is added. Keep the mixture at a moderate red heat for an hour. If there be an excess of sulphur it is to be expelled by a moderate heat, and if all parts should not be equally coloured, the finer portions after powdering may be separated by washing with water. *Annales de Chimie et de Physique, 37. 409. According to the author of this process, sulphuret of sodium is the colouring principle of the lapis lazuli, and of course of the artificial as well as the natural ultramarine.

This pigment loses its colour totally by being put into an acid, and although there is no perceptible effervescence, a slight smell of sulphured hydrogen gas is recognised; the residue is of a dirty white colour; the alkalis do not act upon this colour, nor is it destroyed by exposure to a red heat.

It hath hitherto, on account of its high price, been used almost exclusively by artists, both as a water-colour and in oil; but on account of the reduced charge at which it will probably be hereafter obtained, it will doubtless be rendered much more extensively useful.

**Cobalt Blue.**—This was proposed as a substitute for ultramarine before the invention above described had rendered this latter colour easily obtainable at a moderate price. According to Thenard (Treaté de Chémie, tome I.) this pigment, the base of which is either a phosphate or arseniate of cobalt, is prepared by adding a solution of phosphate of soda to one of nitrate of cobalt; the precipitated phosphate of cobalt, after due washing, is to be mixed with most hydrate of alumina, the proportions being one of the phosphate to eight parts of the hydrate; or half the quantity of arseniate of cobalt may be substituted for the phosphate.

These substances are to be thoroughly mixed and then dried in a stove, and when the mass has become brittle it is to be calcined in a covered crucible at a cherry-red heat for half an hour.

This colour is one of great permanence, but is not so fine as the ultramarine, and will hereafter be probably little employed.

**Smalt** is a blue colour also prepared from cobalt, but is generally used rather to diminish the yellow tint of writing paper and of linen, and to give a bluish colour to starch, than strictly speaking as a pigment; it is merely glass rendered blue by oxide of cobalt, and this when reduced to a very fine powder is commonly called powdered blue. [See Coal.]

**BLUE-BIRD** (zoology). the American name for the Motacilla alba of Linneus, Sylvia alba of Wilson, Saxicola alba of Bonaparte, Ampelis alba of Nuttall, and Erythaca (alba) Wilsoni of Swainson.

Wilson, *as much confidence in man by associating with him in summer, as the other by his familiarity in winter.*

'So early as the middle of February, if the weather be open, he usually makes his appearance about his old haunts, the barn, orchard, and fence-posts. Storms and deep snows sometimes succeeding, he disappears for a time; but about the middle of March is again seen accompanied by his mate, visiting the box in the garden, or the hole in the old apple-tree, the cradle of some generations of his ancestors.'

* * * * * * * 'When he first begins his amours, says a curious and correct observer, *it is pleasing to behold his courtship, his sollicitude to please and to secure the favour of his beloved female. He uses the tenderest expressions, sits close by her, caresses and sings to her his most endearing warblings. When seated together, if he espy an insect delicious to her taste, he takes it up, flies with it to her, spreads his wings over her, and puts it in her mouth.*

The food of the blue-bird consists principally of insects, particularly large beetles and other coleoptera, frequently of spiders, and sometimes of fruits and seeds.

The nest is built in holes in trees and similar situations. The bird is very prolific, for though the eggs, which are of a pale-blue colour, seldom exceed six, and are more frequently five in number, two and sometimes three broods are produced in a season.

Its song is cheerful, continuing with little interruption from March to October, but is most frequently heard in the serene days of the spring.

With regard to its geographical distribution, Catesby says, *These birds are common in most parts of North America; for I have seen them in Carolina, Virginia, Maryland, and the Bermuda Islands.* Wilson gives the United States, the Bahamas, Mexico, Brazil, and Guiana, as its localities.

About November it takes its departure from the United States. The whole upper part of the bird, which is about seven inches and a half long, is of a rich sky-blue shot with purple. The bill and legs are black. Shafts of the wing and tail, feathers black. Throat, neck, breast, and sides, partially under the wings, reddish chestnut. Wings dusky black at the tips. Belly and vent white. The female is duller in its colours.

It is said to be much infested with tape-worms.

This bird must not be confounded with the Arctic Blue-bird (Erythaca Arctica, Swainson, Stalia Arctica, Nuttall), another species of Swainson's subgenus Stalia. The latter has no red or chestnut about it, the colours being ultramarine-blue above, greenish-blue beneath, and whitish on the posterior part of the belly and under tail-coverts. The specimen figured in the Fauna Boreal-Americana was shot at Fort Franklin in July, 1825.

Swainson mentions another species, his Stalia Mexicana, from the Table-land of Mexico.

**BLUE-BOTTLE,** a pretty wild flower, commonly found in corn-fields. It is the Centaurea cyanus of botanists.

**BLUE-BREAST** (zoology), the English name for the pretty bird, which, as Bechstein observes, may be considered

No. 274. [THE PENNY CYCLOPAEDIA.]
as the link between the red commond and great watagai, having strong points of resemblance to both. It is the Go10
as the Blue Mountains, the Blue Mountains, river, between 32°
beech to the north, and then it suddenly runs to the north, encloses Lake George, and continues north of it in the same direction under the name of Cullarin Range. At nearly an equal distance from 33°5 and 34° the chain again turns to the east and approaches the sea within forty or fifty miles. Running at this distance parallel to the shore (that is N.E.) it extends as far as 33° and perhaps a little to the north of it, where it again turns northward, and continues in that direction till it has passed the 32nd parallel and attained a distance of about 140 miles from the sea. Here it meets with another extension of the Liverpool Range, which runs east and west and seems to be the southern part of a mountain system which extends over a greater space than the Blue Mountains, in the direction from west to east, and whose continuation northward is not farther known. It is possible that it continues up to Cape York, the northeastern cape of Australia on Torres Strait.

The highest part of this mountain-range is the Warrego
the Blue Mountains, does not attain a very great elevation. Its average height may be 3000 feet, and though doubtless it contains many more eminences of very considerable height that any of them exceed that height. These mountains are difficult to be crossed on account of the steep rocks which crown the upper part of the chain, and which are only broken by narrow and deep ravines. Twenty-five years elapsed after the colony of Port Jackson before our countrymen succeeded in passing over these mountains.

The Liverpool Range attains a much greater height, its summits rising to 6500 feet above the sea; but the passes can be traversed with greater ease.

The country between the Blue Mountains and the sea is partly filled with its lower branches, and partly with sandy plains between them and the sea. In some places the hills come down to the very shores, as at Illawarra and Newcastle; at other places they terminate at a distance of thirty miles from the sea. On the western side the mountains are less steep, and descend towards the coasts of considerable extent till they terminate in the low plains which occupy the interior of Australia.

In order to go from the coast to these plains, the mountains of course must be ascended. Up to the present time this has been effected at two places only. One of these passes lies a little to the north of the parallel of Sydney, and a carriage-road has been made through it. It begins on the banks of the Nepean River, the principal branch of Hawkesbury River, at Emu Ford, and ascending the steep Lapstone Hill continues rising to Springwood, twelve and a half miles distant from Emu Ford. Farther on to Weather-Board Hut, sixteen miles from Springwood, the ascent is not considerable. Weather-Board Hut is on Kingsland Road, 22 miles from the sea. Hence the road passes through the vale of Cowd, or the valley on the south side of Mount York, which vale is 2496 feet above the sea; Mount York rises to 3229 feet. From this vale the road skirts the southern declivity of Mount York and leads to Cox's Pass, on the banks of Cox's River. From this pass is twenty-one miles distant from Weather-Board Hut, and has been developed as the western extremity of the mountain passes: the remainder of the road to Bathurst leads over an undulating plain. Bathurst is 1970 feet above the sea, according to Oxley. This portion of the mountain is formed of sandstone, which extends to Mount York and even to Cox's River, where it is succeeded by granite, which afterwards at Molong, to the N.W. of Bathurst, gives way to a limestone formation with numerous caves, and at the junction of the Bell River and the Macquarie, it is succeeded by freestone. But as the country falls rapidly from this point, every extension soon disappears and is succeeded by the flat country.

The second mountain pass lies farther to the south, near the 35th parallel, beginning at the point where the Wolon-dilly River turns to the north. It ascends along the course
of this river to Goulburn Plains, then passes through a narrow ridge to Bredale Plains, and again through another smaller ridge to Martins Plains, where the shrine of the range between Yass River and Murrumbidgee River.

This range is not rich in metals. Copper has been found near Bathurst, and tin and lead in some other places; but coal seems to be abundant, especially at Newcastle, towards the Hume River. Boulders of granite and whinstone, pipe and potter's clay, limestone, gypsum or plaster of Paris, and alum. (Oxley; Sturt; P. Cunningham; Society's Map.)

BLUE RIDGE. [See Appalachian Mountains.]

BLIND REL MUSUM. An assemblage of choice specimens of sculpture, consisting of statuary busts, bas-reliefs, sarcophagi, cinerary urns, and other antient marbles, collected by the late Henry Blundell, Esq., and preserved at his seat at Ince-Blundell in the parish of Sefton in Lancashire, about nine miles north of Liverpool. A large portion are placed in a building attached to the mansion called the Pantheon, exactly resembling the edifice of that name in Rome, though one-third less in lineal dimensions, erected for the purpose of containing them; a few modern sculptures are also in this collection, among which a Psyche by Canova is the most valuable.

Two folio volumes of Engravings and Etchings, from the principal of these marbles, were prepared by Mr. Blundell for distribution among his friends in 1809: some of these had been made at Rome, before the marbles left that city, since broken up 200 years ago. Long before that time, in Italy at the same time with his friend Mr. Charles Townley, and not only collected with a kindred taste, but was frequently guided in his choice of purchases by Mr. Townley's advice.

Among the statues of highest character in the Blundell Museum are—1. A Minerva found at Ostia, for many years in the Lanti palace, and afterwards the property of Mr. Jenkins, from whom it was bought; larger than life. 2. Diana, found in the ruins of the Emperor Gordian's villa; the full size of life; bought of the sculptor Alabaci. 3. Theseus, seven feet two inches high; found in Hadrian's villa: purchased from the Duke of Modena, in the centre of the saloon at whose villa at Tivoli it stood. 4. Mars, found at the Villa Matelli, nearly seven feet high. 5. A colossal statue of the Emperor Vespasian, called Cicero in the Arundel Collection at Oxford; this also was bought from the Prince Matelli. 6. Another Minerva, seven feet high, which formerly belonged to Pope Sixtus V.; bought out of the Negroni collection. 7. A statue of Octavia near the province Buthrotum; bought out of the Villa D'Este from the Duke of Modena. 8. Faustina, the wife of Marcus Aurelius; the head, feet, and hands of Parian marble; the drapery in Lepadian marble, a kind of opaque basalt. 9. A group of two statues, an old father and young man, comprehended in the same niche, with the name upon the plinth; it was found by Niccolà la Piccola in an excavation on the Prænesto road, 1776; small life, about three feet high. Among the busts are those of Septimius Severus and Otho, both bought out of the Matelli Villa; Augustus and Marciana, found at Ostia; and Julius Caesar, the adopted heir of Hadrian, which was also purchased from the Prince Matelli. Among the miscellaneous marbles of this collection are three tragic masks of rare and unusual size; two from the Villa Negroni, three feet each in height; two from other sources, one foot in height; both may be formed of the extinction of this collection from the fact that it consists of near 100 statues, 150 busts, above 100 bas-reliefs, 90 sarcophagi and cinerary urns, besides stelae, and other miscellaneous antiquities.

BLUNDERBUSS. [See Arms.]

BLY, or SOUTH BLYTH, or BLYTH NOOK, a small seaport town in the county of Northumberland, partly in the parish of Horton, but chiefly in that of Earsdon, and in the east division of Castle ward, distant from London 257 miles, N. by W., and from Newcastle 12 miles N. by B. It descents on the west side of the river Blyth, at its confluence with the German Ocean. The town owes its origin and prosperity to its commodious and safe haven for small vessels. The navigable river and port of Blyth are mentioned as of con-

sequence to the bishops of Durham in former times, and are named in their records with the Tyne, Wear, and Tees, being subject to their jurisdiction. The prelates of that diocese held the jurisdiction over the fishery and the wastes between high and low water marks. The river Blyth rises about twenty-five miles inland, and its general course is east by north, from which it makes one great bend to the north before it has passed Stamfordham. On continually its course towards the sea, it enters Blythswood from the north-west, after which it goes on nearly in the same direction for about nine miles, when it receives another stream from the north-west, after which it inclines to the south-east, and enters the ocean, after a total course of about 110 miles. The whole of its course is near its mouth; and those fresh-water fish that frequent the higher parts of the stream are of very fine quality. The shore near its estuary abounds abundance of muscles, which are used for bait by the fishermen of the neighbouring places.

Blyth harbour is so safe that an instance rarely occurs of a vessel sustaining damage in entering it in the most tempestuous weather. In full tides there are ten feet of water on the bar; when there are only eight feet, stationary lights are exhibited in the harbour. The tide flows up to the dam at the Bedlington iron-works, four miles and a half from the mouth of the river. The place was of very trifling consequence previously to the Restoration, when it appears to have contained scarcely any houses. It must after that have rapidly increased, as we find that in 1728 not fewer than 200 vessels were in the port. In 1740, Lord Townley having sailed from this port. Its trade would seem to have declined after this: towards the latter part of the last century there were only a few small sloops belonging to the port; but the opening of the Cowpen colliery, near the end of the century, materially increased the traffic at Blyth, which consists chiefly in the export of coal and iron from Bedlington, and sometimes corn. Thirty or forty sail of laden vessels sometimes sail in one tide. They usually return in ballast; few articles are imported, except such timber and stores as are required for the shipping. About 100 vessels now belong to the port, which is regarded as a sort of creek to that of Newcastle.

Blyth is a pleasant and well built little place. It has a custom-house, subject to that of Newcastle; two ship insurance companies, and several clock-yards, in which vessels of 430 tons have been built. There is a neat chapel of ease, which was erected in 1751 by Sir M. W. Ridley, the proprietor of the estate; and to which a Sunday-school has since been annexed. Different denominations of dissenters have chapels and meeting-houses.

The township of South Blyth and Newham contained 248 houses in 1831, when the population was 1769, of whom 977 were females. This however does not convey a true idea of the extent and population of the town, as it only includes those parts of it which are included within the parish of Blyth, but, adding to the account that part in the township of Cowpen, parish of Horton, the actual population must exceed 3000.

(Hutchinson's View of Northumberland; Historical and Descriptive View of Northumberland, &c.)

BOA (zoology), the name of a family of serpents which are without venom, the absence of which is amply compensated by immense muscular power, enabling some of the species to kill large animals by constriction, preparatory to swallowing them. The boa is the best known of the family.

There are few fables which have not some truth for their origin. The voyages of Sinbad have become proverbial; but the stories of the monstrous serpents in the valley of diamonds, and of the 'serpent of surprising length and thickness,' whose scales made a rustling as he moved along, 'that swallowed up two of his companions, probably had their foundation in traditions of the size and strength of a family of serpents belonging to the old world, but nearly allied in their organization and habits to those which we are acquainted with in the present day. Indeed of the fate of the first of the two victims brings to our memory a terrible anecdote of the murderous power and voracity of the Indian boa or pythons related in modern times, and recorded on canvas by Daudet. [See Pythons.]"

Aristotle (book viii. c. 28) writes of Libyan serpents of enormous size, and relates, that certain voyagers to that coast were pursued by some of them so large that they overtook one of the triremes. The two monstrous snakes (said to be) sent by Jupiter to strangle the infant Hercules in his cradle, described by Theocritus in his 24th Idyll, exhibit some of the peculiarities of these reptiles. The way in which Theocritus represents them to have rolled their coils around the boy, and relaxed them when he drew near, is obviously intended to describe the snake after it has escaped the serpent. Virgil’s Lacoosin, and the univallled marble group, which the poet’s description most probably called into existence, owe their origin undoubtedly to the stories current of constriciting serpents. Varro Maximus (book i. v. 1) also speaks of a very large, if not the largest serpent into which the Romans under Regulus were thrown by an enormous snake, which had its lair on the banks of the Bagradas, or Magradas (Mejerida), near Utica. It is said to have swallowed many of the soldiers, to have killed others in the same manner, and in fact, till at length, being invulnerable by ordinary weapons, it was destroyed by heavy stones slung from the military engines used in sieges. But, according to the historian, its persecution of the army did not cease with its death; for the writers were polluted with its gore, and the air with the steams from its corruptured carcass, to such a degree, that the Romans were obliged to move their camp, taking with them however the skin, one hundred and twenty feet in length, which belonged to it, sent to Rome by Oescenius, Proconsul of Silius Italicus, and Zonarae, make mention of the same serpent nearly to the same effect. Pliny’s (vi. 14), De Serpentibus Maximis et Bois says, that Megasthenes writes that serpents grow to such a size in India, that they swallowed entire stags and bulls. (See also Nicarchus, quoted by Arrian. Indic. 15.) He speaks too of the Bagradian serpent above-mentioned as matter of notoriety, observing that it was one hundred and twenty feet long, and that its skin and jaws were preserved in a temple at Rome till the time of the Numantine war; and he adds, that the serpents called Boa in Italy confirm this, for that they grow to such a size, that in the belly of one killed on the Vatican hill in the reign of Claudius an entire infant was found 2. Suetonius (in Octav. 43) mentions the exhibition of a serpent of extraordinary size in the temple of Juno at Rome, but without specifying instances from Aelian and others, we will now come to more modern accounts. Bonitus (v. 23) says, ‘The Indian serpents are so multitudinous, that my paper would fail me before I enumerated them all; nevertheless I may say that of the most monstrous ones, sometimes exceed thirty-six feet in length, and are of such capacity of throat and stomach that they swallow entire boars.’ He then speaks of the great power of distention in the jaws, adding, ‘To confirm this, there are those alive which are preserved by the Emperor Peter of Russia. They buried hogs, cut out of the belly of a serpent of this kind. They are not venomous, but they struggle by powerfully applying their folds around the body of a man or other animal. Mr. M’Leod, in his interesting Voyage of the Hebrides, p. 313, gives the following account:

‘It may here be mentioned, that during a captivity of some months at Whidah, in the kingdom of Dahomey, on the coast of Africa, the author of this narrative had opportunities of observing snakes more than double the size of the boa constrictor; but he adds, whether or not they were of the same species, though he has no doubt of their being the genuine Boa. They killed their prey, however, precisely in a similar manner; and, from their superior bulk, were capable of swallowing animals much larger than goats or sheep. Governor Abson, who had for thirty-seven years resided at Port William (one of the African Company’s settlements there), described some desperate struggles which he had either seen, or had come to his knowledge, between the snakes and wild beasts, and other game. The ablest and most fatal rattlesnakes of which he had any knowledge, were fixed in a field near the town and within the dioceseler, by a shepherd, and that the mandibles, two pairs in length, were the ones to be seen in the church of the Virgin. (See Pott, p. 85.)

* The exquisite beauty of the Idyll can only be equalled by the grandeur of design and execution displayed by Reynolds in his picture.

† The passage cited by Valerius Flaccus Livy must have been in the lost deca (306 B.C.). The reader will find however the story recorded in the supplement to Livy (xvii. 15).

‡ De Serpentibus Maximis et Bois, (pp. 306, 307, 315.)

§ Petius, p. 85.
the best fitted for this kind of progressive motion.' (Lectures on Comparative Anatomy, vol. 1.)

Sir Everard, in the same lecture, speaking of the ribs as organs of locomotion, says:—'An observation of Sir Joseph Banks during the exhibition of a coluber of unusual size first led to this discovery. While it was moving briskly along the carpet, he said he thought he saw the ribs come forward in succession, like the feet of a caterpillar. This remark led me to examine the animal's motion with more accuracy, and on putting the hand upon its belly, while the snake was in the act of passing over the palm, the ends of the ribs were distinctly felt pressing upon the surface in regular succession, so as to leave no doubt of the ribs forming so many pairs of levers, by which the animal moves its body from place to place.'

It is not intended to detract in the least from the masterly descriptions given in the lecture here quoted; but it is due to the sharp-sighted Tyson to observe, that the locomotive power of the ribs was detected and published by him in his excellent observations on the anatomy of the rattle-snake. (See Phil. Trans.)

Sir Everard Home informs us by what additional mechanism this faculty is effected. The ribs, he observes, are not articulated in snakes between the vertebrae, but each vertebra has a rib attached to it by two slightly concave surfaces, that move upon a convex protuberance on the side of the vertebra, by which means the extent of motion is unusually great, and the lower end of each vertebra having a globular form fitted to a concavity in the upper end of the vertebra below it, they move readily on one another in all directions. The muscles which bring the ribs forward, according to Sir Everard, consist of five sets, one from the transverse process of each vertebra to the rib immediately behind it, which rib is attached to the next vertebra. The next set goes from the rib a little way from the spine, just beyond where the former terminates, it passes over two ribs, sending a slip to each, and is inserted into the third; there is a slip also connecting it with the next muscle in succession. Under this is the third set, which arises from the posterior side of each rib, passes over two ribs, sending a lateral slip to the next muscle, and is inserted into the third rib behind it. The fourth set passes from one rib over the next, and is inserted into the second rib. The fifth set goes from rib to rib. On the inside of the chest there is a strong set of muscles attached to the anterior surface of each vertebra, and passing obliquely forwards over four ribs to be inserted into the fifth, nearly at the middle part between the two extremities. From this part of each rib a strong flat muscle comes forward on each side before the viscera, forming the abdominal muscles, and uniting in a beautiful middle tendon, so that the lower half of each rib, which is beyond the origin of this muscle, and which is only laterally connected to it by loose cellular membrane, is external to the belly of the animal, and is used for the purpose of progressive motion; while that half of each rib next the spine, as far as the lungs extend, is employed in respiration. At the termination of each rib is a small cartilage, in shape corresponding to the rib, only tapering to the point. Those of the opposite ribs have no connexion, and when the ribs are drawn outwards by the muscles, they are separated to some distance, and rest through their whole length on the inner surface of the abdominal scutum, to which they are connected by a set of short muscles; they have also a connexion with the cartilages of the neighbouring ribs by a set of short straight muscles. These observations apply to snakes in general; but the muscles have been examined in a boa constrictor, three feet nine inches long, preserved in the Hunterian Museum. In all snakes, adds the author, the ribs are continued to the anus, but the lungs seldom occupy more than one half of the extent of the cavity covered by the ribs. Consequently these lower ribs can only be employed for the purpose of progressive motion, and therefore correspond in that respect with the ribs in the Draco volans superadded to form the wings. (See DUGL.)

The subjoined cut, copied from that given as an illustration by Sir Everard Home, will explain the articulating surfaces of the vertebrae and ribs; and on the under surface of the former will be seen the protuberance for the attachment of the muscles which are employed in crushing the animals round which the snake entwines itself.
The cut exhibits two vertebrae, and portions of two ribs of a so-called boa constrictor, drawn with his usual accurate fidelity and skill by W. Clift, Esq., from a skeleton sent from the East Indies by the late Sir William Jones, and deposited in the Hunterian Museum. The letters a, a point to the protuberance on the under surface for the attachment of the constricting muscles, according to Sir Everard Home.

Though the term boa constrictor is used throughout by Sir Everard Home in his lecture, there can be little doubt that the serpent sent from India by Sir William Jones was a python. The small specimen from which the description of the organs employed in progressive motion was taken may have been a boa. But whether boa or python, it would have had the hooks or spurs near the vent, and the bones and muscles belonging to these spurs, which are of no small consequence in the organization of a boa or a python, rudiments of limbs though they be; these appear to have escaped Sir Everard Home's observation, occupied as he was in following out the mechanism of progressive motion.

No one can read of the habits of these reptiles in a state of nature without perceiving the advantage which they gain when, holding on by their tails on a tree, their head and bodies in ambush, and half floating on some sedgy river, they surprise the thristy animal that seeks the stream. These hooks help the serpent to maintain a fixed point; they become a fulcrum which gives a double power to his energies. Dr. Mayer detected these rudiments of limbs, and has well explained their anatomy*. He makes boa the first genus of his family of Phaenopoda (Ophidians having the rudiments of a foot visible externally), adding the genera Python, Erux, Tectrix. After advancing to what Merrem, Schneider, Rusell, Lacépède, Daudin, Oppel, Cuvier, Oken, and Blainville have said or figured relative to these hooks or spurs, he proceeds to his own observations made on Boa Constrictor, Scytale, and Cenchritis. He says, that the spur or nail on each side of the vent in the boa constrictor and other species of the genus is a true nail, in the cavity of which is a little demi-cartilaginous bone, or ungual phalanx, articulated with another bone much stronger which is concealed under the skin. This second bone of the rudiment of a foot in the Boa has an external thick condyle, with which the ungual phalanx is articulated, as above stated: it presents, besides, a smaller internal apophysis, which places it in connexion with the other bones of the skeleton. These bones are the appendages of a tibia or leg bone, the form and relative position of which will be understood by a reference to the subjacent cuts, copied from Dr. Mayer's 'Memoir.'

The figure above given represents the tail of a boa constrictor: a, the vent; b, the hook or spur of the left side; c, the subcutaneous muscle; d, ribs and intercostal muscles; e, transverse muscle of the abdomen; f, bone of the leg enveloped in its muscles; g, adductor muscle of the foot; h, adductor muscle of the foot. The arrangement of the scuta, or shields, of one entire piece under the tail, characteristic of the true boa, will be here observed. In the pythons the shields beneath the tail are ranged in pairs.

We here have a representation of the osteology of this rudimentary limb, taken from the same author. Figure 2. represents the left posterior limb of the Boa Scytale, seen anteriorly: a, tibia or leg-bone; b, external bone of the tarsus; c, internal bone of the tarsus; d, bone of the metatarsus with its apophyses; e, nail or hook.

Figure 3. represents the same limb, seen posteriorly.

Doctors Hopkinsin and Panceast have given in the 'Transactions of the American Philosophical Society,' held at Philadelphia, for promoting useful knowledge (vol. v. new series, part i.), an interesting account of the visceral anatomy of the Python (Cuvier), described by Daudin as the Boa reticulata. And here it may be as well to remark that the differences between the Boa and the Pythons are so small, that the accounts given of the constricting powers and even of the principal anatomical details of the one, may be taken as illustrative of the same points in the history of the other. We select from the paper above mentioned an account of the respiratory and urinary organs, because their structure appears to be peculiarly adapted to the habits of the animal.

The larynx consists of a single cartilage, having a narrow oblique slit in it, about six lines in length, for the transmission of air; the trachea is one foot eight inches in length, and three-eighths of an inch in diameter, and passes down attached to the ventral face of the esophagus. It consists of a large number of imperfect cartilaginous rings, interrupted posteriorly, but joined by an elastic substance which keeps their extremities in contact. Each ring is connected to the adjoining one by a membrane also elastic, so that when the trachea is stretched lengthwise, it will easily regain its former condition. It passes behind the heart, and while there concealed, divides into two bronchi, appropriated to the two lungs. The lungs, in a collapsed state, lie much concealed, being covered in part by the liver; but when inflated, are brought into view, and cause the liver to be raised up. These organs consist in two distinct vessels or bags, united above along their middle, but terminating below, each in a separate cul de sac.

They differ materially in size, but vary less in this respect than those of snakes in general. The right lung is two feet ten inches long, and about four inches broad, and extends down as far as the gall bladder; opposite the spleen,
which are on its left, it has a considerable contracture of its diameter. The smaller vessels lie on the left side, and is loose at its lower end; it is only one foot nine inches long, and three inches broad; it terminates near the lower extremity of the liver. The lower four-fifths of each lung are thin, semi-transparent, and covered with a more opaque structure; the parietes are marked by circular lines or strins, along which are strung small white bodies, apparently vesicular, from half an inch to two lines distant from each other; they are more numerous above, and smaller near the lower end of the inner cavity. The upper portion of each lung is composed of a more opaque structure; the parietes are much thicker, and present on their inner surface a loose reticulated texture, somewhat resembling a section of the corpora cavernosa penis, the mucous membrane being much larger. A free passage is left through the lungs, and from the side of the heart to the lungs, which is necessary to pass through the cells, which seem to present a merely a more extensive surface for the purposes of respiration. Both lungs contained many worms, found most abundant above among the cells, and even in the trachea; they were of various dimensions, being from one to three inches in length, whitish, cylindrical, tapering, and surrounded in their whole length by elevated rings or cords.

The authors of the foregoing description do not seem to have observed a part of the mechanism of the organs of respiration, and very likely also the nourishment of the serpents. Fust, &c. That gentleman, in his lectures at the Royal College of Surgeons, after alluding to Mr. Broderip's paper on the mode in which the boa constrictor takes its prey, and of the adaptation of its organization to its habits, hereinafter given, and of the manner in which it swallows its prey, states that in the larynx, is, during the operation of swallowing, protruded beyond the edge of the dilated lower jaw, exhibited a drawing of two muscles which he had detected in the lower jaw for the purpose of bringing the larynx forward, in consequence of which its position was drawn to the point by the statement made in the paper.

Without going into a detail of the anatomy of the other organs given by Drs. Hopkinson and Pacoast, it will be sufficient to remark that they detected a peculiarity of structure in the respiratory organs which must produce the injurious effects of an impeded circulation when the stomach is distended with food; a distention, from the habits of the animal, likely to be great and of long duration. Under such circumstances they remark that the peculiarly constructed vessels may, by a circulatory route, carry a large proportion of blood to the heart, which the vena cava alone would be unable to accomplish in a state of partial compression.

Having endeavored to give the reader some insight into the organization of these serpents, we now proceed to describe, in greater detail, the manner in which one of the observers, by eye-witnesses of the manner in which that organization is brought into action for the purpose of killing and swallowing their prey.

Mr. M'Cleod, in his 'Voyage of H.M.S. Alceste,' gives the following painfully vivid account of a serpent, a native of Borneo, sixteen feet long, and of about eighteen inches in circumference, which was on board. There were originally two; but one, to use Mr. M'Cleod's expression, 'sweaped overboard and was drowned.'

Mr. M'Cleod, speaking of the survivor, he is said have been usually entertained with a goat for dinner, once in every three or four weeks, with occasionally a duck or a fowl by way of a dessert. The live-stock for his use during the passage, consisting of six goats and two fowls, was eaten by the serpent, one of the five being considered as a fair allowance for as many months.

At an early period of the voyage we had an exhibition of his talent in the way of eating, which was publicly performed on the quarter-deck, upon which his crib stood. The snake was taken to the persons of the ship, and the door of the cage was shut. The poor goat, as instantly aware of all the horrors of its perilous situation, immediately began to utter the most piercing and distressing cries, butting instinctively, at the same time, with its head into the body of the serpent. The snake, which at first appeared scarcely to notice the poor animal, soon began to stir a little, and, turning its head in the direction of the goat, its length a fixed a deadly and malignant eye on the trembling victim, whose agony and terror seemed to increase; for, previous to the snake seizing its prey, it shok in every limb, but still continuing its unsavory show of attack, by butting at the serpent, which now became sufficiently animated to prepare for the banquet. The first operation was that of darting out his forked tongue, and at the same time rearing a little his head; then suddenly seizing the goat by the fore-leg with his fangs, and throwing it down, it was enclosed in an instant in his horrid folds. So quick indeed and so instantaneously was the act, that it was impossible for the eye to follow the rapid convolution of his elongated body. It was not a regular screw-like turn that was formed, but resembling a long, thick, and strong rope, the body overlaying the other, as if, to add weight to the movements, which were more effectively to crush the object. During this time he continued to grasp with his fangs, though it appeared an unnecessary precaution, that part of the animal which he had first seized. The poor animal, and cautiously unfolded himself, till the goat fell dead from the convulsion of the stomach caused by the serpent to prepare himself for swallowing it. Placing his mouth in front of the dead animal, he commenced by lubricating with its saliva that part of the goat, and then taking its muzzle into his mouth, which had, and indeed always has, the appearance of a raw lacerated wound, he sucked it in, as far as the horns would allow. These protuberances opposed some little difficulty, not so much from their extent as from their points; however, they also in a very short time disappeared, that is to say, externally; but their progress was still to be observed, and the whole animal at last made out a passage through the skin. The victim had now descended as far as the shoulders; and it was an astonishing sight to observe the extraordinary action of the snake's muscles when stretched to such an unnatural extent—an action which was still more manifest when the artist would have power in any animal that was not, like himself, endowed with very peculiar faculties of expansion and action at the same time. When his head and neck had no other appearance than that of a serpent's skin stuffed almost to bursting, the working of his muscles could be perceived by no power of sight, as it is erroneously called, unabated; it was, in fact, the effect of a contractile muscular power, assisted by two rows of strong hooked teeth. With all this he must be so formed as to be able to suspend for a time the weight of his gigantic prey, an operation which he accomplishes by the arrangement of the muscles of his neck and the crushing effect of his jaws. The animal was afterwards, after a short period, made use of as the regular food of the ship, and we were assured that almost all he swallows is converted into nutrition, for a small quantity of calcareous matter and that perhaps not a tenth part of the bones of the animal, with occasionally some of the hairs, seemed to compose his general food."

It was remarked, especially by the officers of the watch, who had better opportunities of noticing this circumstance, that the goat always had a great horror of the serpent, and evidently avoided that side of the deck on which his cage stood.

* P. 90.

Mr. Broderip, in the second volume of the ' Zoological Journal,' after referring to Mr. M'Cleod's interesting narrative, of the correctness of which, as far as it goes, he says he has not a single doubt, and observing that two points in that description struck him forcibly, the one as being contrary to the peculiar character of the serpent, and the other as being contrary to Mr. Broderip's observations, proceeds to give the following account of the manner in which the serpent takes its prey in this country.

* This was most probably the virtue of the animal, which he often voided in frequented dumps, like moist places. In appearance, and has been frequently taken for an Indian or boys, a small snake. Transmissions of a butyricaceous constitution, becoming hard like chalk by pressure, or by water, or powdery, or powdery.
Mr. Cops of the Lion Office in the Tower,' writes Broderip, 'sent to inform me that one of these reptiles had just cast its skin, at which period they, in common with other serpents, are most active and eager for prey. Accordingly I repaired with some friends to the Tower, where we found the reptile, the floor of which consisted of a tin case covered with red baize and filled with warm water, so as to produce a proper temperature. There was the snake, "possum novus exuvis," gracefully examining the height and extent of his prison as he raised, without any apparent thought of escaping from the confines of his place.

A large buck rabbit was introduced into the cage. The snake was down and motionless in a moment. There he lay like a log without one symptom of life, save that which gleamed in his eyes. Presently he made object within the range of his eye. At length the rabbit, totally unconscious of his situation, approached the ambushed head. The snake dashed at him like lightning. There was a blow—a scream—and instantly the victim was locked in the coils of the serpent. This was done almost too rapidly for me to note; instant the snake was motionless; in the next he was one congeries of coils round his prey. He had seized the rabbit by the neck just under the ear, and was evidently exerting the strongest pressure round the thorax of the quadruped; thereby preventing the entrance of air and at the same time depriving the anterior extremities of motion. The rabbit never cried after the first seizure;—he lay with his hind legs stretched out, still breathing with difficulty, as could be seen by the motion of his flanks. Presumably the snake seizing these strong hind legs; but the snake cautiously applied another coil with such dexterity as completely to manacle the lower extremities, and, in about eight minutes, the rabbit was quite dead. The snake then gradually and carefully uncoiled himself, and finally removing his victim from the place where it lay, he placed his foot against the side of the tub, and began to treat it so roughly, that the rabbit was withdrawn for fear of his injuring the snake. This treatment of the snake by the rabbit did not appear to be the effect of anger or hatred, but to be adopted merely as a mode of removing something which he did not like in his way. I have seen many rabbits and owls presented to different specimens of boa for prey, and I never saw the least symptom of uneasiness either in the birds or quadrupeds. They appear at first to take no notice of the serpent, later manifesting some fear and do not start, but seem to treat it with the greatest indifference. I remember one evening going up into the room where one of these snakes was kept at Exeter 'Change, and seeing the hen which was destined for the prey of the boa, very comfortably at rest upon the floor. The keeper took the hen in his hands and held it opposite to the head of the snake, without succeeding in inducing him to take the bird, which, when let out of the keeper's hands again, settled half upon the serpent for the night.

The only reason given me by which the difference between Mr. McLeod's description and my experience, is one which I do not propose as absolutely satisfactory, but which may nevertheless be found to approach the truth. The goats put to death at Batavia for the serpent, which it appears was brought from Borneo, were all in probability natives of Java, and if so, they would, according to the wonderful instinct which nature has implanted in animals for their preservation, be likely to have a violent antipathy to the larger serpents, such as those which t heir for their prey. The canines of Python cornigera and goats were wild, or originally from the wild stock of the island, their instinctive horror at the sight of the destroyer may be thus accounted for. But our domestic fowls and rabbits (the last of the latter most probably indigenous, and that of the former of such remote importation, and so much changed by descent, as to be almost on the same
Boa (flying), having no such natural enemy as a large serpent, against which it is necessary for them to be on their guard, are entirely without this instinct, although it is strong enough in the case of their ordinary enemies, such as hawks, dogs, and cats; and they consequently view the boa which is about to dash at them with the same indifference as if be were a log of wood.

The author of the foregoing paper, in conclusion, gives to persons who have the care of these reptiles a hint not to expose their hands too much in holding fowls, &c., to the head of a boa when near shedding its skin, and consequently nearly blind (for the skin of the eye is changed with the rest), in order to induce it to take its prey. Mr. Cops, the keeper of the lion-office, was holding a fowl to the head of the largest of the five snakes which were there kept, when the serpent was in this condition. The snake darted at the bird, missed it, but seized the keeper by the left thumb, and coiled round his arm and neck in a moment. Mr. Cops, who was alone, did not lose his presence of mind, and immediately attempted to relieve himself from the powerful constriction by getting at the snake’s head. But the serpent had so knotted himself upon his own head that Mr. Cops could not reach it, and had thrown himself on the floor, in order to grasp with a better chance of success, when two other keepers coming in, broke the teeth of the serpent, and with some difficulty relieved Mr. Cops from his perilous situation. Two broken teeth were extracted from the thumb, which soon healed; and no inconvenience of any consequence was the result of this frightful adventure.

In this instance, the snake fixed itself by its tail to one of the posts of its cage, thus bringing the spurs into action and giving itself greater power.

We now proceed to a consideration of the subdivisions of the genus Boa, properly so called, founded on the integuments of their head and jaws, adopted by Cuvier.

Head covered to the end of the muzzle with small scales like those of the body. The plates with which the jaws are provided not dimplsed (creusées de fossettes).

Example. Boa Constrictor of Linneus; Devlin, or Emperor Boa, of Daudoin.

This powerful species is distinguished by a large chain extending the whole length of the back, composed alternately of great blackish shins or spots irregularly hexagonal, and of pale red ones, or spots notched or jagged at either end, the whole forming a very elegant pattern. In his lectures, mentions a skin of this species, measuring thirty-five feet, preserved in the British Museum, and adds, that it is probable that many ages ago much larger specimens might have occurred; than at present to be found, the increased population and cultivation of most countries having tended more and more to lessen the number of such animals. The locality of this species, according to the best authorities, is confined to the New World. Daudain, indeed, believed that it was found in the ancient continent, but without sufficient grounds for his opinion. Le Vaillant and Humboldt brought it from Guiana, and the Prince de Wied found it in Brazil. Cuvier gives it as his opinion that there are no true boas of large size in the old world.

Linnaeus, quoting Dalberg, says that the Boa Constrictor was worshipped by the American Indians. "Our men were conducted to a broade crosse-way, standing on the side of the town. Here they show them a square stage or pulpit fourte steps high, partly of clammy bitumen, and partly of small stones, into which an image of a man cut in marble was joyned, two fourte-footed beasts, and some crosed waters upon him, which, like madde dogges, seemed they would tear the marble man’s guts out of his belly. And by the image stood a serpent, besmeared all with goare blood, showing a marble lion, which seems suspended in the air, and small stones entwined together, was seven upon seven feet in length, and as thick as a great ox. Next unto it were three raffers or stakes fastened to the ground, which three others crossed under-propped with stones; in each they publish malleriles confirmed, for proof whereby they saw numerable broken arrows, all bloody scattered on the ground, and the bones of the dead cast into an inclosed courte neere unto it."

Pietro Martire.

Bulkoh, in his "Six Months in Mexico," speaks of a noble specimen of the great serpent-idol, almost perfect and of fine workmanship, in the cloisters behind the Do minican convent. This monstrous divinity is represented, according to him, in the act of swallowing a human victim, which is seen crushed and struggling in its horrid jaws. That these Mexican serpent-idols were fashioned from boas, there can, we think, be little doubt. Such were most probably the Tlilcoátli, Temacuelahuillan, and the Bits of Hernandez, who describes the latter as of the thickness of a man, and says that it ascends trees, whence it vibrates, being fixed by its tail, and snatches men and beasts and other animals of that kind, sometimes devouring them whole. This serpent he mentions indeed as a production of the island "Cubu," and as seen in the island Iñatah by the Spaniards when they were anxious to disbar their ships. The Tlilcoátli and Temacuelahuillan appear to have been continental; and of the serpent last named he gives so formidable an account that there appears every reason for supposing it to have been the prototype of the snake-god of the Mexicans. "It derives its name," says Hernandez, "from its strength, for Temacuelahuillan is, fighting with five men; it attacks those it meets, and overpowers them with such force that if it once coils itself round their necks it strangles and kills them, unless it bursts itself by the violence of its own efforts; and he goes on to state how its attack is avoided by the man opposing a tree or other object to its constriction, so that while the serpent fancies that it is compressing the man it may be torn asunder by its own act, and so die. The same author states that he had seen serpents as thick as a man’s thigh, which had been taken when young by the Indians and then, and how they were provided with a cask strown with litter, in the place of a cavern, where they lived and were for the most part quiescent except at meal times, when they came forth and amicably climbed about the couch or shoulders of their master, who placidly bore the serpent-embrace.

* Bernard or Berna, or Bernardo) Diaz del Castillo.

* Besides the Constrictor of Linneus, representative of its beauty, Laurenti, according to Cuvier, gives the following appellations to the Boa constrictor. — Constrictor rex serpentum, Constrictor cimpanus, Constrictor diphilanthus. The two latter plainly indicate the supernatural feeling with which it was regarded by the natives.

2 See post. p. 27.
The flesh of this serpent is white, and abundant in fat. The people of the plains never eat it, but make use of the fat as a remedy for rheumatic pains, ruptures, strains, &c. When these creatures are young the colours on the skin are very bright, and gradually lose their brilliancy with age.

There is generally in these descriptions an account of the fleshy tongue of the reptile, and of its application to the dead animal for the purpose of covering it with saliva, previous to the operation of swallowing it. A glance at the tongue of a Boa or a Python will convince the observer that few worse instruments for such a purpose could have been contrived. The delusion is kept up by the mode in which these serpents are sometimes preserved in museums, where they may be occasionally seen with fine artificial, thick, fleshy, vermilion tongues in the place of the small dark-coloured extensile organs with which nature has furnished them. We have frequently watched constrictrng serpents while taking their prey, and it is almost superfluous to add that they never covered the victim with saliva from the tongue before deglutition. When the prey is dead and the serpent is about to swallow it, the tongue of the destroyer is frequently thrust forth and vibrated, as if indiatory of the desire for food; but the mucus is not poured out till it is required to lubricate the dilated jaws and throat for the disproportioned feast.

The Rev. Landsdown Guiding thus records the capability of the Boa to cross the seas:—A noble specimen of the Boa Constrictor, says that lamented zoologist, was lately conveyed to us by the currents twisted round the trunk of a large sound cedar-tree, which had probably been washed out of the bank by the floods of some great South American river, while its huge folds hung on the branches as it waited for its prey. The monster was fortunately destroyed after killing a few sheep, and his skeleton now hangs before me in my study, putting me in mind how much reason I might have had to fear in my future rambles through St. Vincent had this formidable reptile been a pregnant female, and escaped to a safe retreat.

**Scaly plates from the eyes to the end of the muzzle. No dimples on the jaws.**

**Example.** Boa Scytale and Boa murina of Linnaeus, *Boa aquatics of Prince Maximilian.* This species referred to

*(Boa Scytale)*
by Linneus under two specific names, according to Cuvier, is the *Boa\textit{ aquavtica} of Prince Maximilian and the Anaconda according to the same authority. Mr. Bennett observes in The Tower Menagerie that the name of Anaconda, like that of Boa Constrictor, has been popularly applied to all the larger and more powerful snakes. He adds that the word appears to be of Ceylonese origin, and applies it to the Python Tigris.

Brownish, with a double series of roundish black blotches all down the back. The lateral spots annular and oblongated, the disks being white, surrounded by black rings. Inhabits South America. The trivial name *Murina* was given to it from its being said to lie in wait for mice, and Seba has given a representation of its about to dart upon an American mouse, which says it is its usual food. Such a "small deer" may be the prey of this species when very young, but it grows to a size equaling that of Boa constrictor and Boa constrictrix. We think it very probable that this is the "Culebra de Agua" of the Venezuelans mentioned above.† The other provincial name, "El Traga Venado," or "Deer Swallow," indicates the prey of the serpent when of mature age. Linnaeus says of his Boa Scytale, "Constrictit et deglutit capras, oves," &c. "It constricts and swallows goats, sheep," &c. The *Boa marina*, then, was probably only a young *Boa Scytale*.

***

*Scaly plates on the muzzle; and dimples upon the plates at the sides of the jaws.*

---

Yellowish, with a row of large brown rings running the whole length of the back, and variable spots on the sides. These are generally dark, often containing a whitish semilunar mark. This species, according to Seba, who describes it as Mexican, is the *Tomacuileahuilula* (or *Tumacuila Huilul*, as Seba writes the word) described by Hernandez, and hereinbefore mentioned.‡ The three species here described, according to Cuvier, grow nearly to the same size, and haunt the marshy places of the warm parts of South America. There, adhering by the tail to some aquatic tree, they suffer the anterior part of the body to float upon the

---

Greenish, with white irregular longish spots somewhat annularly disposed. This is the *Boa viridis* of Boddaert, the *Boa thalassina* of Laurenti, the *Bojobi* of the Brazilians, the *Tetracrinus Ticca* (a Mexican name) according to Seba, and the *Cobra verde* of the Portuguese, who relate that these serpents sometimes remain in the houses, doing no harm till irritated, when they at last bite and inflict a wound full of danger, not from injected poison, for the serpent has none, but on account of the injury sustained by the nerves from the very sharp, slender, and long teeth. Great inflammation follows, and the symptoms are aggravated by terror, so that a gangrene is the consequence unless the proper remedies are applied. In the absence of these certain death is said to be the consequence of a severe bite from this serpent. The immediate cause of death is not stated by Seba, but from the long and penetrating teeth of the *Boa canina* it may be presumed to be often tetanus or locked jaw. Seba says that this species varies in size, adding that the specimen from which his figure was taken was more than two cubits in length. Cuvier is of opinion that the *Boa hirpmale* is only a young *Bojobi* or *Boa canina*.

BOA.

[From Life-Boat.]

BOAT-BILL (zoology), the English name for the genus Cochlearius of Brisson, Canceroma of Linnaeus, Le Sauvage of the French.

This genus of the family Ardeidae (heron-like birds) would approach quite closely, as Cuvier observes, to the herons (genus Ardea, Cuv.), in regard to their bill and the kind of food which it indicated, were it not for the extraordinary form of that organ, which is nevertheless, when closely observed, the bill of a heron and the bittern much flattened out. This bill is of an oval form, longer than the head, very much depressed, and not unlike the bows of two spoons placed one upon another, with the rims in contact. The mandibles are strong, with sharp edges, and dilated towards the middle. The upper mandible is carinated, and hooked at its point, which has a small tooth or notch on each side of it. The lower mandible is flatter than the upper, straight, membranous in the centre, and terminated by a sharp point. The nostrils are oblique, longitudinal, and closed.

The first quill is short; the five next are the longest. The feet are furnished with four toes, all long, and almost without membranes.

Though zoologists have described more than one species, it appears that they may be referred to the only species yet known, Cochlearius fuscus of Brisson, Canceroma cochlearia of Linnaeus, Le Sauvage of Buffon, the differences on which Canceroma cancrorhaga (Lin., &c.) is founded are not being allowed to be specific. Leach, in his Zoological Miscellany, figures and describes 'the common boat-bill' under the title of Canceroma vulgaris, but assigns no reason for altering the specific name given by Linnaeus.

The common boat-bill is about the size of a domestic hen. In the male, the forehead, and upper parts of the neck and breast, are dirty white; the back and lower part of the belly rusty-reddish; the bill is black, and the legs and feet brown. From the head depends a long crest of black feathers, falling backwards. The female has the top of the head black, without the elongated crest; the back and the belly rusty-reddish; the wings grey; the forehead and rest of the plumage white; and the bill, legs, and feet brown.

'This species,' says Latham in his Synopsis, 'for I refer all that has been treated of above to one only, inhabits Cayenne, Guiana, and Brazil, and chiefly frequents such parts

BOAR. [See Hog.]

BOARD, a word used to denote, in their collective capacity, certain persons to whom is intrusted the management of some office or department, usually of a public or corporate character. Thus, the lords of the treasury and admiralty, the commissioners of customs, the lords of the committee of the privy council for the affairs of trade, &c., are, when met together for the transaction of the business of their respective offices, styled the Board of Treasury, the Board of Admiralty, the Board of Customs, the Board of Trade, &c. The same word is used to designate the persons chosen from among the proprietors to manage the operations of any joint-stock association, who are styled the Board of Directors.

In parochial government the guardians of the poor, &c., are called the Board of Guardians, &c. The word bureau in France is an equivalent expression.

BOAR'ARIA (Stephens, in entomology), a genus of moths of the family Geometridae. All the species of this genus are of a grey color, some minutely dotted with brown, and adorned with several fasciae of a deeper colour; the antennae of the males instead of being pectinated, a character common in the Geometridae, are pilose; palpi short, clothed with short scales, three-jointed, the two basals of usual length, the terminal joint concealed; antennae simple in the females; thorax small, velvety; wings, when at rest, placed horizontally; body slender in the males, in the females shorter and more robust.

Mr. Stephens, in his Illustrations of British Entomology, enumerates seven species of this genus, most of which are found in woods in the neighbourhood of London. For descriptions of these species we refer our readers to the work above-mentioned.
BOB

as are near the water. In such places it perches on the trees which hang over the streams, and, like the kingfisher, drops down on the fish which swim beneath it. It has been thought to live on crabs likewise, whence the Linnean name; but this is not clear, though it cannot be denied; yet we are certain that fish is the most common, if not the only food.

Leach, in his Zoological Miscellany (1815), says that it inhabits the west and most parts of South America, and perches on trees by the side of rivers, where it lives on fish, and not on crabs, as its name indicates; and speaks of it as inhabiting the inundated savannahs of South America, and as being especially common in Guiana.

Cuvier, in his Reign Animal (1829), says that it inhabits the coast and many parts of South America, and perches on trees by the side of rivers, whence it precipitates itself on the fish which afford its ordinary nourishment.

We saw this bird alive in Exeter Change some years ago. In captivity it had the melancholy air and gait of the herons and bitterns, which it has also, according to authors, in a state of nature. The food of this captive bird was principally fish.

BOATSWAIN, a warrant officer in a ship of war who has the care of the rigging, cables, cordage, anchors, sails, boats, files, colours, and other stores, which are committed to his charge by indenture from the surveyor of the navy. He has particular charge of the long boat and its furniture, and it is his duty to steer it, either himself or by his mate. One of the chief duties which devolve upon this officer is to attend to the rigging of the vessel, which he is charged to inspect every morning; not only to observe that everything is properly fitted and arranged in its place, but to see that all things are in good condition, to remove whatever may be judged unfit for service, and to supply whatever may be deficient. He cannot however cut up or otherwise appropriate any cordage or canvas for the public uses of the ship without a written order from the captain, and under the inspection of the master. His instructions inculcate the utmost strictness in the use of the stores entrusted to him; and at the end of a voyage he must present to the surveyor of the navy minute accounts, previously audited and vouched by the captain and master, of the purposes to which all the stores in his department have been applied, or of the circumstances under which they may have been lost, stolen, misapplied, or returned to the dock-yard. He cannot receive his pay till his accounts have been approved.

In this department the boatswain is much under the control of the master; his more exclusive function is that of superintending and control which he exercises over the men and their duty, and over the work of the mates in the necessary business of the ship, and relieves the watch when its time expires. His calls on the crew are made by a silver whistle of a peculiar construction, well-known as the 'boatswain's whistle.' He must observe certain rules; and, when called upon by his name, he must not only appear to have properly performed his duties; and be enjoined to observe, 'that the working of the ship be performed with as little noise and confusion as possible.' The boatswain is a sort of provost-marshal in the ship, taking upon himself to inflict small punishment for the smallest breach of discipline, which may be awarded by the captain or by a court-martial. These latter functions he performs through his mates, whose office is perhaps the most unpopular in the navy. A boatswain is entitled to superannuation after fourteen years' service. His pay is a little more than that of an able-bodied seaman, and is 2s. 4d. per month, for 4½ to 22½, and he is allowed two servants in all ships the crew of which exceeds 100 men. The number of his mates varies from four to one, according to the size of the vessel, and their pay similarly varies from 3l. 10s. to 2l. 10s. per month. (Regulations and Instructions relating to his Majesty's Sea Service; Harris's Lexicon Technicum; Table of Naval Allowances, &c.)

BOBER, THE, a large river in Prussian Silesia, has its source near Oppau, to the north-west of Schataltar, on the northern slope of the district of Oppau, and runs close upon the borders of Bohemia. It traverses the plateau of Hirschberg, and during this course, as well as until it reaches Braunau, a village in the Silesian circle of Liegnitz, flows through a narrow and, in general, rocky valley. From Hirschberg its general course is north past Bunzlau to the junction of the Sprotte, where it takes a general N. W.
tain a sufficiency of food throughout the summer without molesting the harvest of the farmer; until the ripening of the latest crops of oats and barley, when, in their autumnal and changed dress, hardly known now as the same species, they sometimes show their taste for plunder, and flock together to consume before the reaper the crops left behind in the account of the snow-bunting. This appears also to be the case with the woodcock, having observed that the first flight of these birds (which seldom remains longer than for a few days to recruit, and then passes southward) consists of the males. The subsequent and latest flights (which continue with us) are principally composed of males.

Dr. Richardson says that the 54th parallel, which it reaches in June, appears to be the most northern limit of the bob-o-link, and gives a description of a male in its mup-

and we know that there is a temporary separation of the sexes among other birds besides the chickadee. 'This separation of the sexes,' says Selby, speaking of the last-men-
tioned bird, 'I am induced to believe, takes place in many other species, with very few exceptions.' The hen has been observed in the account of the snow-bunting. This appears also to be the case with the woodcock, having observed that the first flight of these birds (which seldom remains longer than for a few days to recruit, and then passes southward) consists of the males. The subsequent and latest flights (which continue with us) are principally composed of males.

and the female, whose plumage the adult male assumes after the breeding season, has the back streaked with brownish-black, not unlike that of a lark, according to Catesby, and the whole under parts of a dirty yellow. The young males resemble the adult females; while, of

BOBROV, SEMEN SERGEEVITCH, a Russian poet of some distinction, who commenced his literary career about 1784. His most important, if not most extensive work is the 'Kherosomida,' a poem descriptive of the wild scenery, natural history, and antiquities of the Tartar. In this production, which first appeared in 1803, and was afterwards corrected and enlarged, there is much originality both of subject and manner, and it is further remarkable for being written in blank verse, a form before unknown to Rus-

The male in his nuptial dress has the head, forepart of the back, shoulders, wings, tail, and the whole of the under plumage black, going off in the middle of the back to a rich chestnut-brown, and finally to ash-gray on the rump. Behind the eye there is a large patch of ochreous yellow on the nape and back of the neck; bill bluish-black, which in the female, young male, and adult male in his autumnal dress, is pale flesh-colour; the feathers of the tail are sharp at the end, like a woodpecker's, and of very unequal length; whilst,

The female, under the name of Carolina ortolan, gives the following interesting account of the rice-bird, from which it appears that the damage done to the farmer by this compa-

'About the middle of August, in congregating numbers, devoured already of all selective attachment; vast foraging parties in a state of wildness, and Perdix and Perdix' are of the south. Here, along the shores of the large rivers, lined with floating fields of the wild rice (Zizania), they find an abundant means of subsistence during their short stay; and as their flesh, now fat, is little inferior to that of the Eu-

It is evident that Catesby was not aware of the change of the bob-o-link in the autumnal and generation of the males at the termination of the breeding season, but it is singular that he should never have met with a cock among the scores which he opened in the autumn. Is it not possible that some temporary separation of the sexes may take place in Carolina at that time, as it does in Virginia? With us two different hatchings with us, it appears, from Bartram's account quoted by Nuttall, that the males frequently arrive in the spring before the females,
complexion and the liveliness of their look, by their attachment
to their native soil, and their willingness to labour.
The women are more bold in their bodily frame, and fruitful
in bearing children. Civilisation makes little progress among
them, and we often find the distinction of sexes has undergone little change for ages past. The ani-
mals, like the men, are distinguished by their small size;
not merely the domestic animals, cows, horses, and sheep,
but even the wild animals, hares, rabbits, and partridges.
The large fowls of the Neapolitan district of the Valle
d'Agerede degenerate if transferred to La Bocage. The dis-
trict yields little grain except oats, rye, and buckwheat, but
there is some good pasture land. It contains wood;
and somewhat, as I was told here. (Malo-Brun, Expilly.)

BOCCA, the name given by the Neapolitans for a
French woman whom his father had made acquainted
with during a visit to Paris; but whether he was born at
Paris or Florence is not ascertained. He studied at Flo-
rence under the grammarians Giovanni da Strada until
he was 13, and then went to the university of Paris, and
when he was 16 he went to Venice. (See Petrarca.)
The object of Boccaccio's admiration proved to be Mary,
the daughter of Aquino, and a presumed
daughter of King Robert of Naples. Boccaccio's attach-
ment was returned; and to please his mistress he wrote "Il
Filopeo," a romance in prose, which was begun in 1292,
and published in 1294. (See Crescimbeni, Commentarii, lib. iii.)
Chaucer borrowed from the "Teseide" his "Knights' Tale," after-
wards remodelled by Dryden under the name of "Palamon
and Arcite." Boccaccio dedicated the "Teseide" to his Fiam-
matta, the name which he gave to his mistress Mary.

In 1292 Boccaccio was recalled home by his father, but he
returned to Naples, where he remained for several years.
He there wrote the "Amorosa Fiammetta," in
which he describes the range of absence from a beloved
object, with uncontrolled passion. In "Il Filopeo,"
"Teseide," and "Amorosa Fiammetta," the name which he gave to his mistress,
and his real name "Miria." At this time he frequented the court of
Queen Joanna, who had succeeded her father Robert. He
read his works to the queen, and at her request, as it appears,
he wrote "His Decamerone," a hundred tales, ten of which are
supposed to be told every afternoon of ten successive days
by a society of seven young women and three young men,
who, having fled from the plague which afflicted Florence
in 1345, had withdrawn to the country house of the
Bocage. One of the stories turn upon love-intrigues;
they are full of humour and admirably told, but the details
are often very licentious. Several of the tales however are
unexceptionable, and are even moral. Some of the subjects
of the tales are taken from older works, but most of them are
original. (See Manni, Storia del Decamerone.)

While at Naples Boccaccio amused himself with writing in
the Neapolitan dialect, in which there is extant a hu-
merous letter addressed by him to Francesco de' Bardi,
a young Florentine merchant, who came to Naples. He
Boccaccio went from Naples to Calabria, and some say also
to Sicily, either for the purpose of studying Greek, or in
order to collect MSS. for his library. He seems also to
have been acquainted with the Monk Barlaam, who was
well versed in Greek. During his researches he visited
Monte Casino, where he found the library in a sad state of
dilapidation, through the neglect of the monks. (See Bene-
nuto da Imola's Commentary on Dante, Paradiso, c. xxii.)

About the year 1356 Boccaccio returned to Florence, where
he spent the greater part of the year 1357 writing his
"Iliad," a poem in octave rimes, which he spent in travelling and in pur-
chasing MSS. Chiefly of the Greek and Latin classics. What
MSS. he could not purchase he contrived to copy.

His merits being now known and appreciated by his con-
temporaries, he was sent to the court of the Pope,
who in the latter part of his reign (1364) conferred upon him a
number of offices and missions. He was sent several times to Ro-
ma, to the lords of Ravenna and Forlì, and afterwards on
a mission to Louis of Bavaria, Marquis of Brandenburg
in Germany, and again to Pope Innocent VI. In
1351 he was sent to the court of the Emperor,
who, on his return from his campaigns, had
vince to him the revocation of the sentence of exile passed
against his father during the faction of 1302, as well as the
restoration of his paternal property, which had been
confiscated. Petrarch was at the same time invited to come
to Italy, which was at that time in better condition for
wéll in his paternal country, but he declined the
invitation.

In 1355 Boccaccio wrote "Il Corbaccio, ossia il Labirinto
di Amore," a kind of satire against women, full of indecent
passages. It is said that he wrote it to revenge himself on
a certain widow who had slighted him. His Fiammatta appears to have died at Naples some time before.

In 1356, having induced the Florentines to found a
chair of Greek literature in their university, he repaired to
Venice for a professor, and brought home with him Leonzio
Torcello, a young scholar who was to be his assistant in this
mission. He returned to Venice, and afterwards to Constantinople. On his return to
Italy he was killed by lightning on board ship.
Boccaccio learned Greek from Pilatus, who made for his pupil's
use a Latin translation of Homer: a copy of this transla-
tion, made by Nicolas Ninio, is still in existence in the Benedictine
Library at Florence. (Tiraboschi, Storia, vol. v. lib. iii.
cap. i.) This translation by Pilatus has been ignorantly
attributed to Petrarch. Petrarch only bespoke a copy of it,
which Boccaccio sent him. (See Hosty, de Graecis Illust.
triter. London, 1807, p. 41.)

Pilatus was a learned but uncooth man. Boccaccio
lodged him in his own house, and treated him with great
kindness notwithstanding his repulsive manners and bad
cleanliness. Three years after this he applied to
Pilatus for a gift which he was given, and from
Venice, and afterwards to Constantinople. On his return to
Italy he was killed by lightning on board ship.

In 1361 a great change took place in Boccaccio's moral
conduct. His life had till then been regular, and most of
his writings licentious, but in that year Father Ciani, a Cia-
thusian monk, came to him and stated that Father Petroni
of Siena of the same order, who had died shortly before in
odour of sanctity, had commissioned him to exhort Boc-
caccio to forego his profane studies, reform his loose life,
and become a monk. To prove that Petroni was in gen-
eral true, Ciani told Boccaccio several circumstances, known
only to Boccaccio and Petrarch. Boccaccio wrote imme-
diately in great agitation to his friend Petrarch, expressing
his resolution to quit the world and shut himself up in a
Carthusian convent. Petrarch's answer, which is among
his Latin epistles, is remarkable for its sound and clear
sense. Without ascribing much weight to the mysti-
rious circumstances of the monk's communication, he ex-
icted his friend to listen to the warning, so far as to
adopt a new and regular course of life, which he might do
without shutting himself up in a convent, and without
giving up his studies and his books. This letter calmed
the eager expectations of Boccaccio, who had written to the
friend of Petrarca, and he became an altered man. His studies took a more seri-
ous turn, and he devoted part of his time to the perusal of
the Scriptures. It was soon after this that he wrote to Ma-
nario de' Cavalcanti, marshal of Sicily, imploring him not to
allow his Decameron to be published by the females of his
family, 'who, though they might by education and honour-
able principles be above temptation, yet could not but have
their minds tainted by such obscene stories.' And as an
apology for himself, he stated that it was a work of his youth,
and that he had left it in a state of incomplete maturity. He,
therefore, sent, with the will of the powerful, majori coacta imperio, allud-
ing probably to Queen Joanna's request. It is remarkable
that he did not forward his Decameron to Petrarch, as he
used to do his other works, and it was only by accident that
Petrarch saw a copy of it several years after it had been in
circulation. Petrarch mentioned this to him in one of his
letters, saying that he supposed it was 'one of his juvenile
productions.' He however praised the description of the
plague and the story of Griselda.

In 1365 Boccaccio arrived at Naples at the request of Ac-
jaiolo, the seneschal of the kingdom, a proud pompous
man, with whose behaviour and mode of living he soon be-
came disgusted, as he afterwards stated in his letter to the
prior of Santi Apostoli. He left Naples (1365) for Venice, where he lived with Petrarca, and on his return to Florence, he was sent by the republic to Pope
Urban V., then at Avignon, and again to the same pope at
Rome in 1367. At this period of his life he appears to
have been distressed in his circumstances, and to have re-
ceived a large income from one of his friends, a lady who
also, on his death-bed, left him with fifty golden florins
'to buy him a winter pelisse to protect him from cold
while in his study at night,' adding, that if he did no more
for Boccaccio, it was only through want of means. The
latter event of this interesting incident was the marriage of
his daughter; Voltaire placed a crown of laurel on her
head, saying it was the only thing wanting to her dress;
and the words forma Venus arte Minervae were assigned
her as a motto. But although so highly extolled, her productions
seemed to have been generally neglected, and the, only
verse, P. 23, of the Ode to Cressen, among her six, was
admired of posterity. Their chief merit seems toт be easy
and correct versification. Her poetical works consist of
an imitation of 'Paradise Lost,' another of Genser's
'Death of Abel.' Les Amazones, a tragedy (which was
acted eleven times), 'La Colombe,' and several small pieces.
The 'Colombe,' as her most am-
bitious attempt, was that upon which her fame chiefly
rested, though now it is probably never read. Her
works ran through four editions between the years 1749 and
1756, and have been translated into French, English, and
Italian. Her prose letters, written during her travels
through England, Holland, and Italy, which were little
read, and her production of 1682 and translated into English by
her daughter, Madame du Boccaccio, seems to have met with no
notice, After a short period of practice at the law, she
was admitted to the bar at Rome in 1362. (Allgemeine Deutsche Real Encyclopädie; Biographie Universelle; Chalmers's Biographical Dictionary; Boutricke, Geschichter Neuerer Poemen und Bardenkunst.)

BOCCALINI. TRAJAN/NO. Eborne at Arezzo in 1556, studied at Rome, and afterwards applied himself to the profession of the law. He was employed by the Court of Rome in several administrative offices, and Gregory XIII.

Boccaccio died in 1375, at the age of sixty-two, sixteen months after the
death of his friend Petrarch. He was buried in the church
of St. James and St. Michael at Certaldo, and a modest epitaph was engraved on his tombstone. In 1863, a cenotaph with a bust in marble was raised to his
memory by the side wall of the church. This cenotaph still exists, but its grave was opened in 1873, and his skull taken out, not through fanaticism as Byron has
assumed, but for the purpose of preserving, as a memento, a repro-
cutiation of the ordinance of Leopold against burials within
the churches. (See Esame storico del Sepolcro di Messer Giovanni Boccaccio, Colle, 1827.) Boccaccio's house at Cer-
taldo has been repaired by the present owner.

He was considered the master of Italian prose. The merits of his Decameron with regard to lan-
guage have been perhaps exaggerated, but still it has the
merit of being the earliest prose work written in pure
Italian. (See Foscolo, Discorso Storico sul Testo del De-
cameron, and also Journal of Education, No. X.) On the
Study of the Italian Language.) Boccaccio and Petrarch
were the revivers of classical literature in Italy. They spared
neither labour nor money in recovering the Greek and Latin
classics, and in giving an impulse to the study of them. Boccaccio wrote several works in Latin: De Genealogia
Deorum; De Montium, Sylvorum, Lacuum, Fluviorum,
Stagnorum et Marium Nominius, Liber; De Casibus Virtu-
orum et Fenninarium illustrium; De Claris Mulieribus, and 16
other philosophical works. He died at Florence, aged 64, on the 23rd of May, 1375. His most famous work is the Decamer-
on, with the eight stories or novels of that period. His
evangelical spirit was seen in an address, in which he
spoke of the events of his time. He gave the key to the real names of the
topics and places to his confessor, Frà Martino da Siena,
and Manni gives an abstract of this key in his Storia del
Decamerone. Boccaccio's Italian works have been published
carefully corrected from the best existing MSS., in 17 vols.
Florence, 1827-34. With regard to the Deca-
merone, the MS. of it by Mannelli, Boccaccio's godson,
who wrote it about 1384, and which is preserved in the
Laurentian library at Florence, has served as a text to most
existing editions. The story of Griselda is the best known.
Boccaccio, Firenze, 1806; and Mazzucelli, Scrittori d'Italia.
BOCCAGE, MARIE ANNE LEPAGE, married to
Fritquel du Boccage, was a French poetess of the last century,
so highly esteemed by her contemporaries, that she was re-
ceived as a member of the academies of Rome, Bologna,
Padua, Lyons, and Rouen. She was born in Rouen in 1710,
and educated in a convent at Paris, where, at this early age,
she was distinguished for talent and a poetic turn. Her
literary taste she however sedulously concealed during the
years of her youth and early maturity, her universal admiration, influenced probably by the habits of
French women of rank and fashion of that epoch, who de-
voiced their youth to coquetry, the period of middle life to
cleverness or its reputation, and their old age to devotion.
In her early life she was the care and delight of her
father; she was an author, and her poem, entitled 'Prix alternatif entre les
Belles Lettres et les Sciences,' gained the first prize given by the then recently founded Rouen Academy. She was from this time surrounded, courted, and eulogized by all the distinguished men of her time. She
sent Petrarch a sonnet, which he presented to his daughter;
Voltaire placed a crown of laurel on her head, saying it was the only thing wanting to her dress;
and the words forma Venus arte Minervae were assigned her
as a motto. But although so highly extolled, her productions
did not reach the same level as those of her contemporaries, and the admiration of posterity. Their chief merit seems to be easy
and correct versification. Her poetical works consist of
an imitation of 'Paradise Lost,' another of Genser's
'Death of Abel.' ¡Les Amazones,' a tragedy (which was
acted eleven times), 'La Colombe,' and several small pieces.
The 'Colombe,' as her most am-
bitious attempt, was that upon which her fame chiefly
rested, though now it is probably never read. Her
works ran through four editions between the years 1749 and
1756, and have been translated into French, English, and
Italian. Her prose letters, written during her travels
through England, Holland, and Italy, which were little
read, and her production of 1682 and translated into English by
her daughter, Madame du Boccaccio, seems to have met with no
notice. She died at the aged of ninety-two, in the year 1692.

BOCCALINI, TRAJAN/NO. Born at Arezzo in 1556, studied at Rome, and afterwards applied himself to the

proffession of the law. He was employed by the Court of Rome in several administrative offices, and Gregory XIII.

Boccaccio died in 1375, at the age of sixty-two, sixteen months after the
death of his friend Petrarch. He was buried in the church
of St. James and St. Michael at Certaldo, and a modest epitaph was engraved on his tombstone. In 1863, a cenotaph with a bust in marble was raised to his
memory by the side wall of the church. This cenotaph still exists, but its grave was opened in 1873, and his skull taken out, not through fanaticism as Byron has
assumed, but for the purpose of preserving, as a memento, a repro-
cutiation of the ordinance of Leopold against burials within
the churches. (See Esame storico del Sepolcro di Messer Giovanni Boccaccio, Colle, 1827.) Boccaccio's house at Cer-
taldo has been repaired by the present owner.

He was considered the master of Italian prose. The merits of his Decameron with regard to lan-
guage have been perhaps exaggerated, but still it has the
merit of being the earliest prose work written in pure
Italian. (See Foscolo, Discorso Storico sul Testo del De-
cameron, and also Journal of Education, No. X.) On the
Study of the Italian Language.) Boccaccio and Petrarch
were the revivers of classical literature in Italy. They spared
neither labour nor money in recovering the Greek and Latin

family, although he did not enjoy such splendid titles as many of his relations. He was the son of a Protestant minister, and himself minister of a persecuted religious body. Etienne Seigneur de Menillet, son of Jean Bochart II, married Marie Blos, and had among other children Marie, Présidente en l'Évêché de Paris, who died childless; and René, minister of the reformed religion at Rouen, who married Esther du Moulin, sister of the famous Petrus Molines, or Pierre du Moulin, by whom he had Samuel, the subject of this notice, who was born in the year 1599.

One of Samuel Bochart's earliest works was the composition of the forty-four Greek verses, which Thomas Dempster, or Demusterus, under whom he studied the classics at Paris, prefixed to his ' Corpus Antiquitatum Romanarum,' in 1612. At that time Samuel Bochart probably lived with his uncle, Pierre du Moulin, at Paris. It is supposed he was brought up early to be a scholar, not merely the Hebrew and Greek, but also the Latin language, which was a necessity in his profession.

Some time afterwards, he proceeded to Oxford, where he obtained the degree of B. A. in 1616, and B. A. in 1617. He then proceeded to Paris, where he obtained the degree of M. A. in 1618. He then proceeded to the study of divinity, which he pursued with great industry, and obtained the degree of Ph. D. in 1620. He then proceeded to the study of law, which he pursued with great industry, and obtained the degree of M. D. in 1622. He then proceeded to the study of medicine, which he pursued with great industry, and obtained the degree of Ph. D. in 1624.

He then proceeded to the study of physics, which he pursued with great industry, and obtained the degree of M. D. in 1626. He then proceeded to the study of chemistry, which he pursued with great industry, and obtained the degree of Ph. D. in 1628. He then proceeded to the study of botany, which he pursued with great industry, and obtained the degree of M. D. in 1630. He then proceeded to the study of zoology, which he pursued with great industry, and obtained the degree of Ph. D. in 1632. He then proceeded to the study of geology, which he pursued with great industry, and obtained the degree of M. D. in 1634. He then proceeded to the study of physics, which he pursued with great industry, and obtained the degree of Ph. D. in 1636. He then proceeded to the study of chemistry, which he pursued with great industry, and obtained the degree of M. D. in 1638. He then proceeded to the study of botany, which he pursued with great industry, and obtained the degree of Ph. D. in 1640.

He then proceeded to the study of zoology, which he pursued with great industry, and obtained the degree of M. D. in 1642. He then proceeded to the study of geology, which he pursued with great industry, and obtained the degree of Ph. D. in 1644. He then proceeded to the study of physics, which he pursued with great industry, and obtained the degree of M. D. in 1646. He then proceeded to the study of chemistry, which he pursued with great industry, and obtained the degree of Ph. D. in 1648. He then proceeded to the study of botany, which he pursued with great industry, and obtained the degree of M. D. in 1650. He then proceeded to the study of zoology, which he pursued with great industry, and obtained the degree of Ph. D. in 1652.

He then proceeded to the study of geology, which he pursued with great industry, and obtained the degree of M. D. in 1654. He then proceeded to the study of physics, which he pursued with great industry, and obtained the degree of Ph. D. in 1656. He then proceeded to the study of chemistry, which he pursued with great industry, and obtained the degree of M. D. in 1658. He then proceeded to the study of botany, which he pursued with great industry, and obtained the degree of Ph. D. in 1660. He then proceeded to the study of zoology, which he pursued with great industry, and obtained the degree of M. D. in 1662. He then proceeded to the study of geology, which he pursued with great industry, and obtained the degree of Ph. D. in 1664. He then proceeded to the study of physics, which he pursued with great industry, and obtained the degree of M. D. in 1666. He then proceeded to the study of chemistry, which he pursued with great industry, and obtained the degree of Ph. D. in 1668. He then proceeded to the study of botany, which he pursued with great industry, and obtained the degree of M. D. in 1670. He then proceeded to the study of zoology, which he pursued with great industry, and obtained the degree of Ph. D. in 1672. He then proceeded to the study of geology, which he pursued with great industry, and obtained the degree of M. D. in 1674. He then proceeded to the study of physics, which he pursued with great industry, and obtained the degree of Ph. D. in 1676.
Popish controversialists went about in order to dispute with Protestant ministers, and to entrap them by unguarded expressions. Veron, who had been trained by the Jesuits, was now travelling through France with the title of Doctor in academia ardentium, with a diploma from the king, and with a New Testament in Latin of his own fabrication, in which he had expressed Aristotle & the Latin atomists cantium, i.e., whilst they were making masses. By this text Veron supported the apostolic origin of the mass. On the fourth day of September, 1629, he urged Bochart to a public disputation, which took place in the castle in the presence of a large assembly of nobility and gentry, and lasted from the 22nd of September to the 3rd of October. Sometimes the Duke of Longueville, viceroy of Normandy, himself attended. In nine sessions Bochart and Veron debated on the accuracy of the French version, the faults of the Vulgate, the misinterpretations, the ignorance of the mass, the good works, mass, prelates, forbidden food, celibacy, certainty of salvation, authority of the Bible, the church, supremacy of St. Peter, power of the pope, the virgin, saints, relics, free will, merits, vows, abstinences, justification, purgatory, the shadow of the dead, number of sacraments, eucharist, equivoque, &c. It was agreed that the minutes of this disputation should be written down by a Popish as well as by a Protestant reporter, who were to read their notes at the conclusion of every session in the presence of the whole assembly, which they were signed by the president and by the two disputants, and then printed. Veron, observing that Bochart had gained more general approbation than himself, left without having terminated the disputation. Bochart enriched his *Actes de la conference touchant la connaissance des sacrements.* He also published *De Paradiso terrrestri,* *Geographia Sacra,* seu Phaleg, et Canaan; *Hierozoicon, on the animals mentioned in the Bible.* He wrote also some dissertations on the plants and gems mentioned in the Bible, parts of these merely fragments remain. The *Phaleg* and the *Canaan* were published A.D. 1640. The famous printer, Johannes Jannounius, of Sedan, was invited to Caen to superintend the printing; nevertheless many errors were committed. The approbation with which Bochart was received was diminished Bochart to bestow all his energy upon the *Hierozoicon,* but two circumstances occasioned delay. Dr. Morley, then chaplain to King Charles II. of England, prevailed on Bochart to write a letter on Episcopacy and Presbyterianism, in order to prove the defects of the one and the advantages of the other. The congregation of Breda. This *Lettre de Morley,* dated March, 1650, is reprinted in Bochart's work under the title *Epistola qua respondentur ad tres questions:* I. De Presbyteratu et Episcopatu; II. De provocazione a judicis ecclesiasticis; III. De jure et posteste Regum. *Scellet hic morum et data sacra suprascripta, talis Us sit mores qua vinca petcreta fuit; Museorum in gremio tenera quae vixit ab aedibus in gremio detraeantur.*

His mind was cheerful, and his body well proportioned, though somewhat under the middle stature. On account of the suavity of his manners he was less exposed to the persecutions of those days than many other distinguished Protestants, but he did not escape entirely. He left a large number of unpublished works; but the *Hierozoicon* has been published by F. C. Rosenmüller, Lips. 1793-96, in three volumes quarto, with additions from modern travellers. Such is the esteem in which the works of Bochart are still held, nearly 200 years since their publication, that Geensius induced the students to peruse diligently Bochart's volumes, which are full of learning. (See the *Dictionaries of Moreri and Bayle*; also the *Via* by Morinus; *Pet. Dan. Huetti Episcopi Abridic значительных Commentarios de rebus, &c.*

In 1560 Matthieu Bochart, Protestant minister at Alençon in the seventeenth century, published a *Traité contre les Réitques,* and a *Traité contre le sacrifice de la Messe.* Judicial proceedings were commenced against him for having given in this treatise the forbidden title of pastors to the ministers. He published also, *Dialogue sur les difficultés que les Missionnaires,* and *De l'examen de France.* This dialogue on the toleration of Lutheran errors induced the Elector Palatine to try if he could unite the two reformed churches in Germany, viz., the Lutherans and the Calvinists, and accordingly he advocated their union in the assembly of Protestant ministers at Augsburg. Upon hearing this, Matthieu Bochart published his *Dialaixon* i.e. *a conciliatory treatise,* 1662, which he dedicated to the Elector Palatine. It contains the plans of this union. Matthieu has been sometimes confounded with his more learned cousin Samuel, of whom we have just spoken.

Bochnta, a province or circle in the north-western part of the Austrian kingdom of Galicia; bounded on the north by Poland, on the north-west by the territory of the republic of Cracow; containing a mountain, an area of about 1004 square miles, which will make it nearly equal to that of Cheshire. It lies between 49°46' and 50°14' N. lat., and 19°50' and 20°59' E. long.

The greater part of Bohemia has an undulating surface; but in the southern districts, the chain of the Bohemian mountains gives the country a mountainous character. In this direction are those extensive forests and rich mineral resources which make the regions about the towns of Bohemia and Wieliszka so valuable to the Austrian crown. This province has the advantage of being skirted on the north by the
Vistula, and on the east by the Dunajec, which separates it from the province of Tarnow: it is also traversed by the Raab or Raba. The soil is inferior in fertility to that of most other parts of the kingdom. It is less adapted for the plough than for rearing cattle, to which great attention is paid. The industry of almsmen is observed. The forests of Bochnia are of no little importance to its prosperity, but the principal source of its wealth is the salt-mines about the capital and in the vicinity of Wieliczka, whose total produce is between 37,000 and 40,000 tons per annum. Some iron is also raised among the Carpathians, and manufactured in the country; and a few linens are made. Bochnia also enjoys the benefits of some transit trade. It contains five towns, nine market-towns, and nearly 400 villages. In 1817 its population was 178,760 souls: it is 15 miles west of Krakow. The capital, which bears the same name as the province, lies about a mile from the Raba, among a low range of hills which run as far as Wieliczka. It is moderately well built, has several churches, a gymnasium, a board of mining, an office for the direction of the saltworks, a head district-school and other seminaries, and is the seat of government for the circle. The salt raised in the vicinity is the produce of a bed which spreads for 1000 fachter (about 1 1-7th miles), from east to west: its depth has not been ascertained beyond 720 feet. This great bed is intermixed with clay and gypsum. The salt-mines here afford employment to 300 labourers, and yield about 12,500 tons annually. Bochnia contains 660 houses, and about 5600 inhabitants, according to a recent census. It is on the 49° 57' N. lat., 20° 25' E. long. To the west of it lies Wieliczka, the next town of importance in the province, with a population of 3500 souls, and extensive mines in its neighbourhood. The remaining three towns are, Wiencek, with a suburb set apart for salt, and a small district called a Monastery, and Podgorze, or Podhorze. A collegiate church, on the ruins of the ancient church, was erected in the 15th century. The town itself is on an elevated position, near an old work, a manufacture of arms, chalk-pits, and flint-stones for arms in the neighbourhood. BOCHOLT-AHAUS, a principality in the circle of Münster, in the Prussian province of Westphalia, which, together with the sovereignty of Anhalt, a domain in the same quarter, belongs to the prince of Salma-Salm, and contains an area of about 620 square miles, and about 57,000 inhabitants. [See Salma-Salm.] Bocholt, on the As, in the above-mentioned circle, is the residence of the principality of Bocholt. It is a market-town, and as such, so far as the poor, a silk manufactury employing 420 looms, a brandy distillery, cotton and saw manufacturies, &c. Much grain is cultivated round it, and there is an iron-factory in its neighbourhood. The town contains two Roman Catholic churches, a school, and an almshouse for the poor. It is situated in 51° 50' N. lat., 6° 32' E. long. BOCLAND, land held by book or charter. The two great distinctions of lands in the Anglo-Saxon times were those of bo-clane and fol-clane. The former means land which had been severed from the land, and converted into an estate of perpetual inheritance. Fol-clane, on the other hand, was the property of the community. Sir Henry Spelman describes fol-clane as ' terrae popularis, quae jure communitati possidentur atque usu sunt.' (Glos., ' Follande.') In another passage, 'Boclane,' he says, 'Prævia Saxones duplèi titulo possidentiæ—vel scripti authoritate, quod Folland vocabant—vel populi testimonio, quod Folland dixere.' The author of a Dissertation on the Follances and Boclandes, in the Quarterly Review, 4th. S. v. 1777, p. 12, says, 'the Boclandes and Follandes are first mentioned in an ordinance of Athelbert, which informs us that the country was divided into two portions, one of them more immediately appertaining to the King and his Thains, the other under the juris- diction of the people. These were divided among the men of every shire, and was denominated Eorl, Kaldorman, or Gerefa, and in latter times Greve, or Reve; he it was that convened the Folenote, which was composed of the possessors of Follandeland, and together with the bishop ad- ministered justice. The Follandeland, over which they had power when they sat in their judicial capacity, and whose decrees was his duty to enforce.' Mr. Allen, in his Inquiry into the Rise and Growth of the Royal Prerogative in England, 8vo, Lond. 1830, goes more at length into this subject: he says that Bocland might belong to the church, to the king, or to a subject. It might be alienable and devisable at the will of the proprietor. It might be limited in its descent, without any transfer of the possession. It was often granted for a single life or for more lives to the king, or to other persons in perpetuity to the church. It was forfeited for various delinquencies to the state. Bocland, moreover, was released from all services to the public, except those which were compulsory in the phrase 'trinca necessitates,' which were said to be incumbent on all persons: these were: the service to military expeditions, and to the repairation of castles and bridges. Bocland also might be held by freemen of all ranks and degrees. A cease might possess bocland and hold it in fee-simple for life. [Febr. 1847.] He had five hides of bocland with other the requisites demised by law, he was entitled to the privileges of a Thiegn. (See Wilkins's Leg. Anglo-Sax. pp. 70, 71.) Gesiths (companions or partners) might receive grants of bocland. (Hickes, Gramm. Anglo-Sax. p. 139. Bede, Hist. Eccles. Patriarch Smith, p. 786.) Thegns might also possess bocland. But estate of a thegn in bocland must not be confounded with the thegn-lands which he held, by a beneficiary tenure from the king or from a private lord, for military service. Thegn- lands held of the king or state are repeatedly mentioned in Domesday; and the Saxons laws carefully distinguish the bocland possessed by a thegn, from the land given him by his hiflord (or order). (See Leg. Con. p. 73.) It is probable that thegn-lands were originally granted for life, as beneficentary lands which were to be retained in the possession of the family as long as the family existed. But after the Saxon period, the possessions given to a man by his hiflord descended in certain cases to his children. (Ibid.) The estates of the higher nobility consisted chiefly of bocland. Bishops and abbots might have bocland of their own, and hold it in fee. The Anglo-Saxon kings had private estates of bocland; and these estates did not merge in the crown, but were devisable by will, alienable by gift, or sale, and transmissible by inheritance in the same manner as bocland held by a subject. Offa, king of the Mercians, had a hundred and ten cases of land in Kent converted into bocland for himself and his heirs, with remainder to the church. These lands did not descend, after the death of his son Ecfrith, to Cyn- wulf, his successor in the Mercian throne, but to Cyn- dritha, abbess of Cotham. Other lands, of which he had possessed himself without a legal title, went also to Cyn- dritha and not to his successors in Mercia. (Wilkins, Con- cis. vol. i. p. 163.) When bocland was created, the proprietor, unless fettered by the original grant, or by a subsequent settlement of the estate, appears to have had an unlimited power to dispose of it as he chose. (Somner's Glovellyn, pp. 88, 89.) In the exercise of that power he might transfer it by grant or charter, and it passed by him. The Boclandes continued, on such conditions as he was pleased to appoint. If conveyed by a written instrument, whatever might be the stipulations annexed to the grant, the land was still denominated bocland. (See Heming's Chartul. pp. 129, 140, 141. 180. 182. 206. 209. Smith's Dedications, pp. 769, 771.) When once severed from the folcland, or property of the community, an estate retained the name of bocland, whatever were the burthen and services imposed on it, provided it was alienated by deed. When transferred in a different manner, though, whether by will or otherwise, it have been called iæland. This appears from a transaction recorded in the Chartulary of Worcester. (Heming, p. 159, see also ibid., pp. 204, 205.) We are there told that arch- bishop Oswald granted to the monastery of Worcester, with the croft attached to it, for the sum of 90 marks, as amply in the form of bocland as it had been held before in the form of lœanland. Lœland might be an estate for life, or it might be held at will; and if the possessor was convicted of felony, he might be deprived of it. (Compare Hicks, Dis- cuss. Epist. pp. 58, 59: Textus Rotfleur. pp. 116, 116; Heming, p. 94; MS. Ch. Ch. Cant.) Bocland, says Mr. Allen, when alienated by grant or will, might be free, or in the seigniory of some church, major, or minor, or in the duchy or barony. (Ibid. pp. 163, 164.) Somner, in his Gloss. Anglo-Sax. p. 96, 384; Somner, Glovellyn, pp. 203, 206; Smith's Dedications, p. 782.) It might be subjected to payments in kind or in money. (Hickes, ut sup. pp. 10, 55. Gramm. Anglo-Sax. p. 149, F 2
Ity might be liable to services, free, servile, or mixed. (Hemming, pp. 134, 184, 189, 293. Domest. tom. i. fol. 269 b.) It might be granted on the condition that the possessor discharged the military or other services due by the proprietor to the state. (Hemming, pp. 81, 96, 233, 265; Smith's Bede, pp. 773, 778, 779, 780.) It might be let for annual rent or for the performance of menial services. (Hemming, pp. 264, 267, 270.) It might be held for lives of men or of women. (Hemming, pp. 81, 96, 233, 265; Smith's Bede, p. 779.) Apes for services certain or indefinite, or with no reservation of services whatever. (Madox, For- mulare, cxxv; Hickey's Gramm. p. 141; Smith's Bede, p. 779.) Tenants of folcald might be persons of the same descent, or strangers, but they held their land under the possessions of the people. Tenants of later times and the copyholder of the present day are not derived from the one more than from the other. Bocland might be forfeited for various offenses, and when forfeited, it escheated to the king as the representative of the state. (Leges Athelredi Regis, 2 Leg. Cnut, 12, 72; Text. Roff. pp. 44, 136; Hickey, Dict. Ep. p. 114; Gale, tom. i. pp. 484, 488.) Land held of a subject, when forfeited for the same delinquency, escheated to the lord. (Leg. Cnut, 75; Judic. Civ. Lond. Wilk. p. 63.) When boc- land was held of a prince, it was, in the view of the law, a present and a private estate. The title of the crown became vested in the heir, declaring that whatever offense the tenant might commit, his land should revert without forfeiture to the grantor. (Hemming, pp. 96, 126, 129, 131, 146, 161, 184, &c.; Monasticum Angl. new edit. vol. iii. p. 37.) Bocland was not held in common. There had been a distinction between bocland and folcald, that is, it followed that the folcald or land of the community, like the fisc of the continental nations, was the fund out of which the bocclands, alienations of the land were carved. At what time, or by whom, or on what occasion the bocland was converted into folcald we are not informed. It was probably soon after the establishment of the Saxons in England; for though a more rude and uncultivated people than the nations which had enjoyed greater opportunities of intercourse with the Romans, they must have found private property in land among the Britons whom they expelled or subdued, and could not long remain insensible to the ad- vantages arising from it. Certain it is, that in one of the earliest charters giving land to the Church, in England, it is stated that the land contained in the donation had been previously the private property of the donor. (Between A.D. 665 and 694, see Smith's Bede, p. 748.) But though condemned at an early period, this private property of the community could not have been slowly and gradually effected. Every charter creating bocland is a proof that the land had formerly been folcald. A charter of Archbishop Wilfrid, who died about 636, asserts in direct terms, that the land which he gives away is "bocland," and the title is made to descend from his, and appeals to general practice, whether a proprietor of bocland might not sell it or dispose of it as he pleased. (Sommer's Gavelkind, p. 88.) In a charter of Burhred, king of the Mercians, the land he grants to an individual is said to have been the property of the kingdom before the donation was made. (Sommer's Gavelkind, p. 80.) Burhred was king of the Mercians from 662 to 674. No charters of any other land than the crown could not be converted into folcald except by an act of government. In early times this was probably done in the gomot or public assembly of the tribe, as temporary allotments to indi- viduals were made in the gomot or assembly of the district. Burhred, king of the Mercians, grants land to an individual as the representative of the state, all charters of bocland ran in his name, and appeared to emanate from his bounty. The power of creating alienal property, by which was meant an estate of inheritance, is enumerated in the Textus Roffensis among the prerogatives of the crown. (Text. Roff. cap. xxvii. p. 44.) But though bocland could not be created without the authority of the king, it was not in his power to convert folcald into bocland without the consent of his witan, princes, seniors, optimates, magnates, or other persons, by whatever name they were called, who assisted him in the administration of his kingdom. There is hardly a Saxon charter creating bocland which is not said to have been granted by the king with consent and leave of his witan, princes and great men, and for the grant was made. (In the proceedings of a council held at Kingston-upon-Thames by Egbert, we are told that his predecessor, Baldred, king of the Kentish men, had given to Christ Church, Canterbury, the manor of Malling in the city of Rochester; p. 772.) Hickey's Gramm. p. 141; Smith's Bede, p. 779.) Apes for services certain or indefinite, with no reservation of services whatever. (Madox, For- mulare, cxxv; Hickey's Gramm. p. 141; Smith's Bede, p. 779.) Tenants of folcald might be persons of the same descent, or strangers, but they held their land under the possessions of the people. Tenants of later times and the copyholder of the present day are not derived from the one more than from the other. Bocland might be forfeited for various offenses, and when forfeited, it escheated to the king as the representative of the state. (Leges Athelredi Regis, 2 Leg. Cnut, 12, 72; Text. Roff. pp. 44, 136; Hickey, Dict. Ep. p. 114; Gale, tom. i. pp. 484, 488.) Land held of a subject, when forfeited for the same delinquency, escheated to the lord. (Leg. Cnut, 75; Judic. Civ. Lond. Wilk. p. 63.) When boc- land was held of a prince, it was, in the view of the law, a present and a private estate. The title of the crown became vested in the heir, declaring that whatever offense the tenant might commit, his land should revert without forfeiture to the grantor. (Hemming, pp. 96, 126, 129, 131, 146, 161, 184, &c.; Monasticum Angl. new edit. vol. iii. p. 37.) Bocland was not held in common. There had been a distinction between bocland and folcald, that is, it followed that the folcald or land of the community, like the fisc of the continental nations, was the fund out of which the bocclands, alienations of the land were carved. At what time, or by whom, or on what occasion the bocland was converted into folcald we are not informed. It was probably soon after the establishment of the Saxons in England; for though a more rude and uncultivated people than the nations which had enjoyed greater opportunities of intercourse with the Romans, they must have found private property in land among the Britons whom they expelled or subdued, and could not long remain insensible to the ad- vantages arising from it. Certain it is, that in one of the earliest charters giving land to the Church, in England, it is stated that the land contained in the donation had been previously the private property of the donor. (Between A.D. 665 and 694, see Smith's Bede, p. 748.) But though condemned at an early period, this private property of the community could not have been slowly and gradually effected. Every charter creating bocland is a proof that the land had formerly been folcald. A charter of Archbishop Wilfrid, who died about 636, asserts in direct terms, that the land which he gives away is "bocland," and the title is made to descend from his, and appeals to general practice, whether a proprietor of bocland might not sell it or dispose of it as he pleased. (Sommer's Gavelkind, p. 88.) In a charter of Burhred, king of the Mercians, the land he grants to an individual is said to have been the property of the kingdom before the donation was made. (Sommer's Gavelkind, p. 80.) Burhred was king of the Mercians from 662 to 674. No charters of any other land than the crown could not be converted into folcald except by an act of government. In early times this was probably done in the gomot or public assembly of the tribe, as temporary allotments to indi- viduals were made in the gomot or assembly of the district. Burhred, king of the Mercians, grants land to an individual as the representative of the state, all charters of bocland ran in his name, and appeared to emanate from his bounty. The power of creating alienal property, by which was meant an estate of inheritance, is enumerated in the Textus Roffensis among the prerogatives of the crown. (Text. Roff. cap. xxvii. p. 44.) But though bocland could not be created without the authority of the king, it was not in his power to convert folcald into bocland without the consent of his witan, princes, seniors, optimates, magnates, or other persons, by whatever name they were called, who assisted
read natural philosophy in the public schools. In 1569 he was elected one of the proctors of the university, and after that, for a considerable time, supplied the place of university orator. Hitherto Mr. Bodley had applied himself to the study of the sciences, and with any inclination to teach any one more than the rest. In 1576, being desirous to improve himself in the modern languages, and to qualify himself for public business, he began his travels, and passed nearly four years in visiting France, Germany, and Italy. After a return to England, he collected himself for the study of history and politics. In 1583 he was made gentleman usher to Queen Elizabeth, and in 1585 married Anne, daughter of Mr. Carew of Bristol, and widow of Mr. Ball, a lady, as Wood informs us, of considerable fortune. So it happened that he was in the year 1587 a member of the embassy to Frederic King of Denmark, Julius Duke of Brunswick, William Landgrave of Hesse, and other German princes, to engage them to join their forces with those of the English for the assistance of the King of Navarre, who, of various factions, had no inclination to engage in that commission, he was sent to King Henry III., at the time when that prince was forced by the Duke of Guise to quit Paris. This commission, he himself tells us, he performed with extraordinary secrecy, not being accompanied by any one else. He discovered it by his letters to the Duke of Norfolk, any other letters than such as were written with the queen's own hand to the king, and some select persons about him. 'The effect,' he continues, 'of that message is it fit I should conceal; but it tended greatly to the advantage of all the Protestant party in the East...' throw, which followed soon upon it.' In 1588 Mr. Bodley was sent to the Hague to manage the queen's affairs in the United Provinces, where, according to an agreement between the Duke of Norfolk and the Council of State, and took his place next to Count Maurice, giving his vote in every proposition made to that assembly. In this station he behaved greatly to the satisfaction of his royal master and the advancement of the same interests. A more particular account of his negociations with the States may be seen in Camden's 'Annals of Queen Elizabeth,' under the year 1595, and in a short piece written by Mr. Bodley himself, and published by Hearne in his notes upon that passage of Camden entitled 'An Account of the King's Great Trouble a Hundred Years After.'

Bodleyan, or Bodleian Library, the Public Library of the University of Oxford, founded in 1597 by Sir Thomas Bodley, in the very year in which he retired from public employment.

The first public library in England was established in what was then called Durham (since Trinity College), by Richard de Bury, or Angerville, bishop of Durham and lord treasurer of England, in the time of Edward III. He died in 1345, and left his books to the students of Durham College, but the members of the university had no right or power to use them, or to borrow or to require them for the use of the monks of Durham College only.

The next we read of was called Cobham's Library, which would have been the first, if Thomas Cobham, bishop of Worcester, had lived to have executed his own purpose. About the year 1552, he had been sent by John de Hulst and other scholars to the university of Paris to set up a library over the old Congregation-House, in the North Church-yard of St. Mary's; but, dying soon after, little progress was made in the work till 1587, when his books were deposited in it, and the scholars permitted to consult them. Cobham was the first public library, and continued in use until 1689, when the books were added to Duke Humphry's collection, for the reception of which the library-room had been completed.

Humphry, surnamed the Good Duke of Gloucester, as much as is possible, was the real founder of the library which was afterwards restored and re-founded by Sir Thomas Bodley. The number of books given by Duke Humphry is variously represented. Wood (Hist. and Antiq. of the Univ. of Oxon.) vol. ii. pt. ii. 4to. 1766, p. 715 adds the different books to the same amount, 6000 volumes, one hundred: one only specimen at present remains, a manuscript in folio of Valerius Maximus, enriched with the most elegant decorations, and written in Duke Humphry's age, evidently with the design of being placed in his sumptuous collection. The rest of the books, which, like his, being highly ornamented, and looking like missals, were supposed to convey ideas of Popish superstition, were destroyed or removed by the visitors of the university in the time of Edward VI., whose zeal was equalled only by their ignorance. A manuscript, containing the life and death of Sir John Capgrave, belonging to Duke Humphry's library, is still preserved in that of Oriel College, Oxford; and one, if not more manuscripts, formerly belonging to the collection, are in the British Museum; most of them, at the end, had usually this inscription, written in the same hand as before, 'C'est livre est un moy Humphry Duc de Gloucestere.' Before the year 1555 the Duke of Gloucester's Library was totally despoiled of its contents, and the desks and benches ordered to be sold; the room continued empty until restored by Sir Thomas Bodley in 1597.

It was in 1597 that, as Camden justly observes, Sir Thomas Bodley set himself a task which would have suited the character of a crowned head—the restoration of the Public Library. With this end in view he sent a letter from London to the vice-chancellor Dr. Ravis, dean of Christ Church, offering to restore the building, and settle a fund for the purchase of books, as well as the maintenance of proper officers. This offer being gladly accepted, he commenced his undertakings by presenting a large collection of books purchased on the remittance of a money written on the title-page, 1574, and the signatures and contributions were sent in, by his example and persuasions, from various noblemen, clergy, and others, to such an amount, that the old building was no longer sufficient to contain them. He then proposed to enlarge the building; and the first stone of the new foundation was laid with great solemnity, July 17, 1610, and so amply promoted by his liberality, as well as by the benefactions of many eminent persons, that the University was enabled to add three other sides, forming the quadrangle and rooms for the
schools, &c. He did not however live to see the whole completed, as the time of his death, already recorded, will explain.

When Sir Thomas Bodley had succeeded in enriching his collection, probably from beyond his expectation, he drew up a body of statutes which have been incorporated into those of the university. According to them, the librarian is to be a graduate, unmarried, and without cure of souls; and to be allowed deputies or assistants. One or two points in these regulations have since been modified; but they contain the principle that no one is allowed to marry, and he can hold personal preferment with his librarianship. The revenues for the maintenance of the library are intrusted to the vice-chancellor and proctors for the time being; and the vice-chancellor and proctors, the three professors of divinity, law, and physic, and the two regius professors of Greek and Hebrew are appointed visitors.

The first catalogue of the printed books of the Bodleian was published in 1660, by Dr. James Thomas Bodley's first librarian. It was dedicated to Henry Prince of Wales, and the books were classed in four faculties, divinity, medicine, jurisprudence, and arts, compiled by an index of authors' names. A more extensive catalogue, in an alphabetical form, was published by Dr. James in 1625, and another catalogue, which had been compiled by him, of works in the Bodleian, printed and manuscript, in interpretation of the Scriptures, was printed in a thin 4to, at Oxford in 1625. * A Nomenclator of such Tracts and Sermons as have been printed or translated into the English tongue in any place, both within and without the Holy Land: now to be had in the most famous Library of Sir Thomas Bodley in Oxford,* was also printed in 1630, in 1642, by John Veneuil.

In 1674 a new catalogue of the printed books of the Bodleian was made, and published in 1677, under the care of Dr. Thomas Hyde; and another of the manuscripts, distinguishing the different collections, was inserted in the general Catalogue of the Manuscripts of England, folio, 1697. A still more extensive Catalogue of the Printed Books was published in two volumes, in 1719, by Dr. James Granger, which was thought so sufficiently perfect in its day, that almost every college library in the university had a copy interleaved, to mark off the books in the catalogue which they themselves possessed, and to insert additions. This is the last general catalogue which has been published of the books in the Bodleian Library; but from the immense increase of the collection it has become but of little use. Another was undertaken a few years ago, and had proceeded, under the direction of the present librarian, Dr. Bandinel, to some extent in the printing; but we are informed that the publication has been since abandoned.

A few catalogues of particular portions of the Bodleian collections have been published at different times. Dr. Uri printed the first part of a catalogue of the oriental manuscripts, and Dr. Bandinel published a catalogue of the Arabic manuscripts, prepared by Mr. afterwards Dr. Alexander Nicol. After the acquisitions made at the Pinelli and some other sales, a small octavo volume, entitled *Notitia Editionum quoad libros Hebr. Gr. et Lat. quam vel primaria, vel sec. xx. impressae, vel Aldianae, in Bibliotheca Bodleiana adseruantur,* was published in 1795; another catalogue, entitled *Codices Manuscripti et Impressi, cum Nois Manuscriptis, olim D'Orvilliani, qui in Bibliotheca Bodleiana adseruantur,* was printed in 1807, by Dr. Gaisford, son of the dean of Christ Church, in 1806; and the first part of another catalogue, of the manuscripts of the collections in the East by Dr. E. D. Clarke, and purchased from him for the Bodleian, was published also by Mr. Gaisford in 1810, followed by into Egyptian upon an inca, or books of Horus, and the *Catalogus Manuscriptorum Antiquorum in Scripitis Bodleianis reconditum,* editted by Mr. Nicol. In 1814, a catalogue of the books relating to British (including Welsh, Scottish, and Irish) topography, and Saxon and northern literature, bequeathed by Richard Gough, Esq., was published at the Clarendon press by Dr. Baring-Gould, in a folio volume, 1826, and a second volume of the catalogue was published in 1835.

An annual speech in praise of Sir Thomas Bodley was founded in 1681, by Dr. John Morris, canon of Christ Church; the speaker to be nominated by the dean of Christ Church, and confirmed by the vice-chancellor. These speeches were delivered at the visitation-day of the library, November the 8th.

It would require a volume to enumerate the many important additions, in books and manuscripts, made to this library by its numerous benefactors, or to give even a superficial sketch of the gradual increase and learning. Among the earliest benefactors were Robert Devereux Earl of Essex, Thomas Sackville Lord Buckhurst and Earl of Dorset, Robert Sidney Lord Sidney of Penshurst, Viscount Lisle and Earl of Leicester, George Carey Lord Hunsdon, William Gage, Anthony Browne Viscount Montacute, John Lord Lumley, Philip Stedman, and Lawrence Bodley, younger brother to the founder. The contributions of all these persons were made before the year 1600.

In 1691 collection of books and manuscripts were presented by Thomas Allen, some time fellow of Trinity College, Thomas James, the first librarian, Herbert Westphaline bishop of Hereford, Sir John Fortescue, knight, Alexander Nowell dean of St. Paul's, John Coke recorder of London and chief-justice of the Common Pleas, and Nicholas Bond, D.D. president of Magdalene College.

The most extensive and important collections however are those of the Earl of Pembroke, the celebrated Mr. John Selden, Archbishop Laud, Sir Thomas Roe, Sir Kenelm Digby, and Mr. Evelyn, Mr. William of Lincoln, Dr. Richard Rawlinson, Mr. St. Amand, Bishop Tanner, Browne Willis, Thomas Hearne, Mr. Nathaniel Cnyres, and Mr. Godwin. The library bequeathed by Richard Gough, Esq., which came to the Bodleian in 1812 (the catalogue of which has been already noticed), is probably the most perfect series of English topographical works ever formed, and is particularly rich in topographical manuscripts, prints, drawings, and books illustrated by the manuscript notes of eminent antiquaries. The last collections of great importance were those of Dr. John Hudson, of Queen's, afterwards principal of St. Mary Hall, 1701; 7. Joseph Bowles, fellow of Oriel, 1719; 8. Robert Frysher, fellow of Oriel, 1729; 9. Humphrey Owen, fellow and afterwards principal of Jesus College, D.C.L. 10. John Pennington, of Merton College, afterwards of Trinity, 1768; 11. Bulkeley Barclay, D.D. late fellow of New College, 1813, the present principal.

All members of the university who have taken a degree are admitted to study in the library; no books have ever been borrowed. Literary persons, either native or foreign, are also allowed, on application, recommended, to read and take extracts from the books in this collection. By the provisions of a statute promulgated and confirmed in full convocation, Dec. 2, 1813, the officers of the library were increased to two cur-der-librarians, with the degrees of M.A. or B.C.L. at least, and two assistants, either B.A. or Under-graduates. The library is open between Lady-day and Michaelmas from nine in the morning till four in the afternoon; and during
the other half-year from ten till three. It is closed on Sundays and state holidays; from Christmas-eve to the 1st of January inclusively; on the feast of the Epiphany; from Good Friday to Easter Tuesday inclusively; on the days of Encarnación and commemoration of saints; and on days immediately following the 1st of September, and eight days preceding the visitation of the library. On all other holidays it is opened immediately after the university-sermon. (See the Roads and Railways, Etc., Oxford, 1763.) Wood's Account of Bodley's Library, Hist. Oxford, 4to, 1760, vol. ii. P. 920-923; Chalmers's History of the Colleges, Halls, and Public Buildings attached to the University of Oxford, vol. ii. p. 438-448; Oxford University Library and City Guide, 8to, and the Oxford University Calendar, 8vo.

BODMER, JOHANN JACOB, the son of a clergyman, was born at Zürich in July, 1698. He applied himself particularly to the study of history and to poetry. Bodmer was still in his youth the object of national reverence in Germany by his letters of honor in the German language and character, his German language letters, and his German language letters of honor with great superciliousness. This controversy, which was carried on for years, and filled up a number of pamphlets and journals, ultimately effected a complete revolution in Germany. Bodmer's work has been translated into several languages, some of which have brought Bodmer's views, and a new and true German school was formed, which produced Klostermann, Lessing, Schiller, Goethe, and a host of others.

Bodmer was deeply read in the Greek and Latin, as well as in the German and French, and he translated Homer and Milton into German. He published in 1758 a collection of the Minnesinger, or old German romantic poets, from a MS. in the Royal Library at Paris. Benecke has since published an improved edition of this collection under the title of Minneleit und Minnelehn der Sammlung von Minnesingen, Göttlingen, 1810. Bodmer published the 'Helvetische Bibliothek,' Zürich, 1732-41, which is a collection of acts relative to the history of Switzerland. He also wrote a poem in twelve cantos on the Deluge, which was translated into French by his friend Spence and Collyer, London, 1767. Bodmer filled for fifty years the chair of literature in the Academy of his native town, Zürich.

He died at a very advanced age in January, 1783. In the course of his life he was considered as the patriarch of German literature, and he took a direct interest in encouraging young men in their studies. His books and MSS. bequeathed to the National Library of Zürich. His correspondence was published, together with that of his contemporaries, by the benevolent Society of Zürich, 1805.

Bodmin, a borough and market-town in the hundred of Trigg and county of Cornwall, 204 miles S.W. by W. from Launceston, and 2344 W.S.W. from London. The parish, which includes the borough, contains 6310 English statute acres, and the borough of 2800 acres. The bounds are surveyed once a year, and a record of the perambulations is preserved.

Bodmin or Bodman, in Cornish Bosvenna or Boswenna, 'the Houses on the Hill,' and in some of the ancient charters Boshamian, the two Swiss cities of Minnesingen, 'the Minnesingers,' owes its origin to the circumstance of St. Petroe's having taken up his abode in the valley now occupied by the present town, about the year 520. That saint, to whom St. Oron (a solitary recluse) had resigned his hermitage, greatly enlarged it for the residence of himself and three other devout men, who accompanied him with the intention of leading a monastic life according to the rules of St. Benedict. St. Petroe, who died about the middle of the sixth century, was buried here, and according to William of Malmesbury, he was buried in a small chapel to the east of Bodmin church. Landal in speaking of it says, 'The shrine and tomb of St. Petrock yet stand in that part of the chancel.' The hermitage was inhabited by Benedictine monks till 936, when King Athelstan founded a priory of the order of St. Benedict. This monastery soon fell into disuse, and its large possessions were seized by Robert, earl of Moreton and Cornwall, and after the death of his son William they became the property of the crown. After having passed through various hands, and been alternately inhabited by Benedictine and St. Augustine monks, nuns, and secular priests, it was granted to one Algar,* who with the licence of William Wearlesew, bishop of Exeter, refounded the monastery in 1125, and installed it with Austin canons, who continued in it till the dissolution of monasteries in the reign of Henry VIII. when its revenue amounted, according to Dugdale, to 2704. 6s. 11d., and according to Speed to 2892. 11s. 11d. The last prior was Thomas Vivian, alias Wannyworth: an Englishman, born in his castle of Wannyworth, a considerable benefice from the tin works in the neighbourhood. Among other privileges the prior held a market and a fair, and possessed a pillory, gallows, &c., from the latter of which we may fairly presume that he had the power of inflicting capital punishment. An imperfect impression of its large demesnes and dependencies, was granted to Thomas Stornell, one of the first translators of the Psalms of David into English metre, and was subsequently purchased by some of the Rashleigh family. Dr. Borlase, gives the name of Stornell, and not without some foundation, supposed that Bodmin was the primary seat of the bishops of Cornwall, and that this honour was conferred on it in 965, when the bishops made it their residence till the end of the year 981, at which date the town and church being burnt by the Danes, and as they removed the town, they were removed to St. German's. But the fallacy of this supposition has been satisfactorily proved by Mr. Whitaker in his Ancient Cathedral of Cornwall historically surveyed, in which he says, 'The town of Bodmin, 614, and that St. German's was made the original seat of it, though he asserts, on the authority of a grant from King Ethelred, that the monastery of Bodmin was annexed to St. German's, and that both these places continued to give a title to future prelates until the annexation of the bishopric of Cornwall to that of Crediton in Devon in 1031, about twenty years after which time Exeter was made the head of the diocese. The same writer also states that it was another religious house dedicated to St. Petroc at Padstow that was burnt by the Danes. An imperfect impression of the abbey seal is attached to the surrender preserved in the augmentation office. In its area the Virgin and infant Jesus and St. Petroc are represented under canopies of Gothic tracery, with the words 'S. Maria et Petroc,' and in the centre of the legend which went round. (Dugdale's Monasticon.)

Bodmin is said to be one of the towns which had the power of stamping tin; but it seems that the privilege was lost before 1347, for in that year the burghers petitioned parliament that they might be allowed to stamp tin to deal in all kinds of merchandise, yet they were hindered by the prince from buying or coming tin. They were unsuccessful in their application, and their petition was dismissed. Some centuries ago Bodmin must have been a wealthy town, for it is stated that less than 1500 persons died of the pestilence. William of Worcester, who visited Cornwall in the reign of Edward IV, speaks of this as recorded in the registry of the friars, and at the same time he adds that, during that same year, there died in various parts of the town 3000 persons. Bodmin is one of those decayed towns, to repair which an act was passed in the 32d of Henry the Eighth.

In 1496, Perkin Warbeck, the pretended Duke of York, landed in Cornwall, and assembled here a force of 3000 men, with which he attacked the city of Exeter. A serious insurrection of the Cornishmen took place in 1498, when Thomas Flanmoc, a lawyer, and Michael Joseph, a farmer, of this town, were chosen leaders, and they joined men to those of Lord Audley at Wells in Somersetshire, and marched with this nobleman as far as Elyham in Kent, where there was then a royal palace; but the insurgents were defeated by the king's troops at the battle of Blackheath, and their leaders, Lord Audley, Flanmoc, and Joseph, were afterwards beheaded.

In 1550, in the reign of Edward VI, the Cornish rebels superstitionously attributing the depression of trade and agriculture to the Reformation, assembled to the number of 16,000 men and placing themselves under the command of Humphrey Arundel, governor of St. Michael's Mount, encamped at Castle Kynock near this town. After a se-
were contest they were defeated by Lord Russell, who was sent to oppose them.

Bodmin having no fortifications, it was successively occupied by both parties during the civil war in the reign of Charles I, and was finally taken by General Fairfax in 1646.

The corporation of Bodmin consists of a mayor, a town or common clerk, capital burgesses, councillors, &c., but is to be re-modelled in conformity with the Municipal Corporation Act, 5 and 6 Will. IV, cap. 76.

The present mayor was conferred on this borough in the twenty-third year of the reign of King Edward I, and it has ever since returned two members to parliament. Prior to the Reform Act, the right of voting was only enjoyed by the 36 capital burgesses, but under that Act, in 1832, 252 of voters registered, 30 were capital burgesses, and 222 occupants. The first charter seems to have been that of Edward III, granted in 1362. Subsequent charters were granted by Richard II, in the reign of Henry VI, in 1539, again in 1554, and by George III, in 1798, in the thirty-eighth year of his reign. This last is the present governing charter, and by it a civil court is directed to be held every Monday before the mayor and town-clerk, or his deputy. It has jurisdiction over all civil actions under 60s., and all pleas of law within the borough. There is also a court of pie-powder; but both these courts have fallen into disuse. By the charter of George III., law-days and views of frankpledge were also given to the corporation, to be held within one month of the feast of St. Michael, and one month next after the feast of St. Michael, before the mayor.

Courts of session of the peace are held here twice a year, which have jurisdiction over all offences except treason, felonies, and other matters touching loss of life. The assizes are held here once, and the county sessions three times in the year.

The town of Bodmin is situated on a gentle slope, in the middle of a vale between two hills, nearly in the centre of the county, and consists of one long street, nearly a mile in length, and a number of houses, which has been redeveloped at the expense of the corporation. The town is not lighted, nor is it watched by night; but seems in a prosperous state, and contains some good houses. The late patron, Lord de Dunstanville, usually expended about 500l. annually in improvements.

It has been the fashion to call Bodmin unhealthy, but that seems without foundation, and so thought Bricke, who published his Geographical Dictionary in 1759, for he mentions it as celebrated for the longevity of its inhabitants. Comments on this are found in all compilations. It is said that he, appealing to Bodmin, 'it ought to be called Badham, for all of towns in Cornwall I hold none more healthily situated than Saltash, and none more contagiously than this.'

The living is a discharged vicarage of the prebendary of St. Enodoc, of the clear yearly value of 263l., and in the gift of Lord de Dunstanville.

The church, which is a handsome structure, was rebuilt about the year 1470. William of Worcester speaks of the old church as considerably older than 1553, and another church, being ninety paces in length by forty in width. It has a handsome tower, on which originally stood a lofty spire, but the spire was destroyed by lightning in 1699. The tomb of Thomas Vivian, the last prior of Bodmin, a variation of white marble, remains at the end of the north aisle of the church, with his effigy in his pontificals placed upon it; and angels supporting shields, both at the head and the feet. Round the tomb are the symbols of the four Evangelists, and two shields of arms carved in alto-relievo. The monument next after the feast of Easter, and one month after the feast of St. Michael, before the mayor, is also very beautiful. The town-hall consists of part of the ancient refectory of the convent of Grey Friars. The corn-market is held in the area; and above is an assembly-room. The county-gaal and Bridewell, a spacious building, stands about half a mile north-west of the town, on the side of an old Roman road which has lately been made into a turnpike.

Bodmin was never of much importance as a commercial town. Bone-lace was formerly manufactured to some extent, but now shoes and boots are the principal commodity, of which a great quantity are exposed for sale in open bazaars. The market is well supplied with corn, fish, and all sorts of provision. Leland, in speaking of the market in his day, says that it was 'lyke a fair for the confluence of people.' And it seems that in the reign of William I., when 'Domesday Book' was taken, the annual profits of it to the priory amounted to 352. There is a woollen-cloth manufacture; and some yarn is spun here.

The population of Bodmin in 1831 was 3470, including about 174 males and 45 females confined in the lunatic asylum and gaol, and a few labourers engaged in the neighbouring mines. One hundred and forty-three families are employed in agriculture, and 295 in trade, manufactures, &c.

There are places of worship for Bryenites and Wesleyan Methodists, and a chapel belonging to the trustees of the late Colonel Trefusis, Esq. There is also a chapel called Berry Chapel, built by the parishioners in the reign of Henry VII. the site of this chapel, with the yard adjoining, is the glebe of the vicar. The ruins of the tower of this church are still remaining, and the great iron gates of the churchyard were formed by Queen Elizabeth, who resided with 5l. 6s. 8d. a year, payable out of the exchequer, to which the corporation have added 90l. per annum out of the market tolls; in addition to which the master is allowed 2l. for each scholar. There is also a National school for girls. And St. mile east of the town is the ancient hospital of St. Lawrence, incorporated by Queen Elizabeth in 1589, under the name of the master or governor and brethren and sisters (thirty-nine in number) of the hospital of St. Lawrence Pountney, the poor men and women to be leprous people, and to elect one another.' King James granted them a market and a fair; the market has long been discontinued, but a fair, which is very well supplied with horses and cattle, is still held on the 21st of August: they hold a fair also for cattle and horses in the market-place, and one in the abbey-church of this hospital amounted to about 140l. per annum; but in consequence of abuse the corporation was dissolved, and the revenue was transferred to the infirmary at Bodmin, by a decree of the Court of Chancery. There appear to have once been two hospitals in this town, one of St. Michael and one of St. Thomas the Apostle, and the latter is represented by the church of St. George, both mentioned in the will of Thomas Killegrew, preserved in the Prerogative Office, and bearing date 1500.

The jurisdiction of the borough extends about a mile round the town, but the parish, which is very extensive, includes the two towns of Callington and Liskeard, and parts of three others, including Cattewater, St. Blazey, and Lelant, and Castle Kynock.

In the vicinity of Bodmin is Halagaver Moor, where a low kind of festival, called 'Bodmin Riding,' was formerly held in the month of July. Carew thus describes it. A mock mayor was elected, before whom was brought some person 'charged with wearing one spurre, or going untrussed, or wanting a girdle, or some such like felony, and after he had been arrayned and tried with all requisite circumstances, judgment is given in formal terms, and executed in this manner, one being thrown into the ditch, and not hurt than hunt of the party condemned. Hence is sprung the proverb, when we see a man slovenly dressed, 'He shall be presented in Halagaver Court.' It is said that Charles II. once 'rode to Halagaver Court.' A large body of the populaion of the town, on some public occasion, make a march to Halagaver, some on horseback and some on foot, carrying garlands of flowers. The evening is spent in wrestling, drinking, &c. About a mile and a half from the town is the race-course, where races are occasionally held. Near Bodmin there is the celebrated Searlet's well, which was supposed to have the miraculous power of curing all diseases. 'Its fame,' says the author of the Survey of Cornwall, 'grew so farre and so fast, that folk rame the king thither in huge numbers from all quarters; but the king comes finding the abuse, and looking into the consequences, forbade the resort, sequestered the spring, and suppressed the miracle.' It is certain that the water of this well is uncommonly pure, and its specific gravity is between the highest and the lowest water. 'It will continue the best part of a year without alteration, and, only then you see it represent many colours like the rainbow, which (in my conceit), saith Carew, 'argueth a running thow some mineral vein, and therewith a possessing the people of a certain health.' Britannia; Carew's Survey of Cornwall, edited by Lord de Dunstanville, and correspondence from Cornwall; Borlase's Antiquities of Cornwall; Corporation Reports; Ecclesiastical Revenues Report, &c.
taste for design, and at hours of leisure engraved vignettes on wood, which have been since sought for by the amateurs. At eighteen years of age a desire to improve his condition induced him to undertake a journey to Rome. He left Saluzzo with a school-fellow, Dominic Costa, who expected to receive ordination as a priest from an uncle, at that time secretary to a Roman prelate. They arrived at their destination, but not without money, but their money failed. Bodoni, by selling some of his engravings on wood to printers, procured sufficient to enable them to get to Rome. But, upon their arrival there, Costa's uncle told them he could do nothing for them, and advised them to return. Bodoni, disappointed by this unexpected reception, yielded to the advice; but, before he quitted Rome, thought he would visit the printing-house of the Propaganda. His general demeanour and vivacity on this occasion pleased the Abate Ruggeri, the superintendent of that establishment, and led him to explain that Bodoni had the good fortune to be engaged there as a workman. In this employment he attracted the notice of the Cardinal Spinelli, at that time the head of the Propaganda, who became his patron, and by whose advice he attended a course of lectures on the oriental languages in the University of La Sapienza, and learned to read Arabic and Hebrew. Being intrusted with the printing of the 'Arab-Copht Missal,' and the 'Alphabetum Tibetanum,' edited by Père Giorgi, he so acquitted himself, that Ruggieri put his name at the end of the volume, and said of him that 'Ruggieri and Ruggeri' (a name of which he took the second syllable) were synonyms. In 1739, he was appointed 'Rector' of the library of the University of La Sapienza. Ruggeri's suicide, however, in 1766 (or as other accounts say, as early as 1762) rendered Bodoni's longer stay at Rome insupportable from regret. At this time he had also accepted an invitation of the Bishop of Fidenza to go to Fidenza to visit his father, through whose influence he was enabled to visit his parents, to see his family, and to inherit a small property. Bodoni returned to Rome, in the interval, offering to place himself at the head of the press intended to be established at Parma, upon the most advantageous terms. But the Library, Bodoni broke through his engagements, and remained there till 1768.

In 1771 he published specimens of his art in 'Saggio Tipografico di Dègri e Majuscule,' in 8vo.; followed in 1774 by 'Iscrizioni esotiche,' composed by J. B. de Rossi; and, in 1785, the 'Narrative of the Circassian,' with the 'Principio Clilico,' distinguished works of the same description, entitled 'Epithalmia esotica linguis reddita,' exhibiting the alphabets of twenty-five languages. Between 1753 and 1788, although his fame became universal, it was not actively employed.

In 1788 the Chevalier d'Azarra, the Spanish minister to Rome, made an offer to Bodoni to establish a press in his palace in that city, to print editions of the Greek, Latin, and Italian classics. Bodoni however refused his solicitations; and in 1789 the Duke of Parma, unwilling that so eminent a printer should be patronized by a foreigner, invaded parochial animosities, formed a similar project, and furnishing Bodoni with a portion of his palace and a press, some of the most beautiful editions of the classics known issued from it: more especially a Homer in folio, in a single volume, in 1791; Virgil in 1793; Cicero, in 1794; Latin Poets, in 1794; Tacitus's 'Annales,' in 1795; and 'Diogenes,' in 1795. Dibdin says, of this last work, only thirty copies were printed, with a few on large paper. In 1794 Bodoni produced a most beautiful edition of the 'Gerusalemme Liberale.' His most sumptuous work of all was his Homer, in three volumes in folio, printed in 1805, with a preface dedicated to the Emperor Napoleon in Italian, French, and Latin. Bodoni was the first French artist to enter Italy, and the early part of the revolution, when Bodoni and his labours had received a marked protection. On the 21st of January, 1810, Bodoni presented a copy of this splendid work, printed upon vellum, in two volumes, to the emperor, in the gallery at St. Cloud, and in return, received a pension of 300,000 francs.

After this time, while Italy was under the French rule, Bodoni received the most tempting offers to quit Parma. Prince Eugene Beauharnais offered him the superintendence of the press at Milan, and Murat that of Naples; but both were flatly refused by Bodoni. He was, however, well received at Paris. In 1811, having received the Cross of the Two Sicilies from Murat, he proposed to publish for the education of the young prince, the son of Murat, a series of French classics, and commenced the task of his part, by a folio 'Telenachus' in 1815. 'Racine' was to have followed; but it was not published till 1814, after Bodoni's death.

Bodoni had long suffered from the gout, to which a fever was at last superadded. He died November 20th, 1813. Within a few months of his death the Emperor Napoleon nominated him a 'Chevalier de la Réunion,' and sent him a present of 18,000 francs to aid him in the publication of the French classics. Bodoni's widow sent forth a work which Bodoni had prepared as long before as 1809, the date of which year appears on the title-page, entitled 'Le piu insigni Piture Parmensi indichi agli Amatori delle Belle Arti,' accompanied by engravings of the different pictures. In 1818 the 'Manuale Tipografico del Cavaliere Giambattista Bodoni,' containing specimens of his various types, appeared from the Bodonian press, the business of which was still carried on by his widow. It forms two splendid volumes in 4to, with his portrait prefixed.

In 1770 Bodoni published a work in English; an edition of Lord Orford's 'Castle of Otranto,' printed for Edwards of Pall Mall, in 1791, 8vo.; and an edition of Thomson's 'Seasons,' in two sizes, folio and quarto, 1794.

Bodoni's classics were not all as correct as they were beautiful. Didot discovered about thirty errors in the Virgil, which are noticed in the preface to his own edition. Among the books of King George III. in the British Museum, is one of twenty-five copies of the Homer on the largest paper, a most splendid specimen of typography. Bodoni's life, the reader may refer to Joseph de Lama's 'Vita del Cavaliere Giambattista Bodoni, 2 tom. Parma, 1816, the second volume of which is filled with an analytical catalogue of the productions of his press. To this book, and to the Supplement of the 'Biographie Universelle,' the students of typography are chiefly indebted for the present account. The reader may likewise refer to Memorie Aneddoti per servire un giorno alla vita di G. B. Bodoni, par le P. Passeroni, 8vo., and to "La Biographie des trois illustres Pianmontais, Lagrange, Dumont, et l'Inventeur des Béquilles," by J. G. Verceil, 8vo. 1814. A medallion with a portrait of Bodoni appears in the frontispiece to the first volume of De Lama's life of him.

BOECE, or BORTIUS, HECTOR, the Scottish historian, was of the family of Bocce of Balbride, or Panbride, in the shire of Angus (now Forfar), a property which an immediate ancestor of his acquired by marriage with the heirs. He was born about the year 1465-6 in the town of Dundee: whence he had the appellation of Deiounans, as he is styled in the ecclesiastical corruptions by Ferrarius. The particulars of his early life are not ascertained; but it appears that he received his grammar education first in his native town and then at Aberdeen, whence he went to Montague College in the University of Paris, where he was afterwards appointed professor of philosophy. This academy he in his after-life highly extolled, and continued gratefully to remember. It was here he became acquainted with many of the learned persons of his time; amongst others Erasmus, whom he kept steadfastly joined to. He is called by Augustine, his bishop, as a mark of his regard, dedicated to him a catalogue of his works. He calls Bocce 'vir singularis ingeni, felicitatis, et facundi oris,' and says of him that 'he knew not to lie.'

In the beginning of the sixteenth century, Bocce was invited home to Scotland by Bishop Elphinstone, who had been his principal of the college about to be erected in that city. This invitation, considering the distinguished person from whom it came, and the high office to which it pointed, must have been flattering to Bocce; but he was unwilling to forsake the literary habits he enjoyed in Paris, which he had been accustomed to think solace held out to him, and he was induced to accept the invitation by means, as himself says, 'of gifts and promises.' When he came to Aberdeen he was made a canon in the cathedral, and was put in possession of the vicarage and the patronage of the parish of St. Ninian, then also presented him to the chaplainry of the altar with its emoluments during his life. (Kennedy's 'Annals of Aberdeen,' vol. ii. p. 36.) But the main inducement which was his appointment to the office of principal of the new college.

The learned author of the life of Melville (M'Crie's 'Melville, vol. i. pp. 210, 211) tells us that prior to the fifteenth century no university existed in Scotland, and that the name of Aberdeen is not of the most ancient. James I. of Scotland had, however, having acquired right to the patronage of the chancellor of St. Ninian, then also presented him to the chaplainry of the altar with its emoluments during his life. (Kennedy's 'Annals of Aberdeen,' vol. ii. p. 36.) But the main inducement which was his appointment to the office of principal of the new college.

The learned author of the life of Melville (M'Crie's 'Melville, vol. i. pp. 210, 211) tells us that prior to the fifteenth century no university existed in Scotland, and that the name of Aberdeen is not of the most ancient. James I. of Scotland had, however,
by Edward, bishop of that see, in the middle of the twelfth century, and his assertion does not stand unsupported. Keith's Catalogue of Bishops, indeed, is incomplete at this time, and does not clearly show the existence of Bishop Ed. 1131, as said by the writer of the Register of Abbot Moric's gift to Dunbar, with all doubt, the papal bull of confirmation by Pope Adrian IV., on the translation of the see from Mortlach to Aberdeen being addressed to Edward, bishop of the see. Keith failed to annex this document to his work, and his last editor has not found it. 106. Robert de Kynimond, who ruled the see of Aberdeen from 1337 to 1381, did, agreeably to what seems to have been the common practice of the place, teach the civil and canon laws on formal days.

But the labours of Bishop Elphinstone were yet wanting. The University of Aberdeen, like many of the foreign universities, and particularly that of Paris, the great prototype of such corporations, from the time of Charlemagne to the middle of the thirteenth century, was without any fixed school-rooms, or lodgings. These were probably in the cathedral, convents, or private dwellings of the city, as was many years the case with the Universities of St. Andrews and Glasgow. A greater defect was its contracted course of study, which was limited to theology and the law. The learned and active prelate set himself to remedy both these evils; and at his request the king, James Iv., applied to the pope to institute a university at Aberdeen comprehending every lawful faculty. Accordingly, Pope Alexander Iv., by a bull dated 10 November, 1497, instituted in Aberdeen such a general seminary in the city of Old Aberdeen. This bull was published in 1496, and the next year King James, by charter of confirmation, 22nd May, 1497, empowered Bishop Elphinstone to erect a college within the University. In 1498 a charter of incorporation was issued for the privileges of the university, and studying at Old Aberdeen; and in 1505 Bishop Elphinstone issued his [first] foundation of St. Mary's, afterwards King's College, which was confirmed the following year by the pope and then by the charter of incorporation. It is not likely that during any part of Elphinstone's connexion with the University of Aberdeen the academical appointments would be carelessly made; and as that distinguished prelate had now been bishop of the diocese nearly twenty years, we may reasonably suppose that the university chairs were well filled. Yet we find that Boece brought with him and took for his colleague Mr. William Hay, who was a native of the same shire of Angus, and had been educated along with him; considering, as it appears, none of the professors of theology were of note or learning. The college was not large, for it appears that Bishop Hay and Bishop Boece who were the other professors in the college, but it is unnecessary to notice them here; and there are no materials for judging with accuracy how Boece continued to perform the duties of his place. In the end of the year 1511, or thereabouts, Bishop Boece, died.

In the beginning of 1522 Boece published at Paris his 'Vita Episcoporum Murthlaisium et Abetronensis,' a work to which he was, it seems, led by the exemplary life of the late bishop, an account of whom, indeed, occupies the greater part of it. The subscription, which is to Bishop Dunbar, is dated from the College of Aberdeen, prid. Cal. Sept. 1521. The same year his printer, Badius Ascensius, gave to the world Major's 'History of Scotland,' composed by Mair (principal regent of Glasgow College, and afterwards bishop of this see) in dedication of the college; and he was attending Montausque College in the University of Paris some years previous. Several other histories of Scotland existed at this time, particularly Prior Wymont's metrical 'Cronykl,' and Fordun's 'Scotichronicon,' long the great fountain of Scottish history. Bishop Elphinstone applied himself to the same department of learning, and compiled (chiefly out of Fordun) a history of his country; but it is probable that Mair's book at once settled the fate of Elphinstone's work (which is yet in manuscript), and determined the course of his future labours and a known great acquirements of Boece to the task. In 1526 the first edition of Boece's History of Scotland was published. If we apply to this work, as some appear to have done, the standards which would be applied to history, its value with its literary inaccuracies, and save it from contempt; but we must apply to it the standard of the day in which it was issued: when knowledge was in the hands of few, and in those few hands meagre and inaccurate; when communication was difficult, and intercourse rare; and when physical science was in its infancy—we should then no doubt admit that Boece merited what he received. In 1527 the king gave him a pension of 50L. Scots yearly, to support his studies, and his printing of his book at Paris, where it was published the same year. Two years afterwards this pension was directed to be paid by the customs of Aberdeen until the king should promote Boece to a benefice of 100 marks Scots of yearly value. By a subsequent regulation the pension was paid partly by the customs of his country, and partly by the town of Aberdeen, by which he held at his death in 1536. The same year (1536) Bellenden's translation of Boece's History was published at Edinburgh. This translation, which was made at the command of King James, whose limited education precluded him from handling the Latin original. While it proceeded, Bellenden, as we see from the treasurer's accounts, had a yearly allowance from the king of 30L. Scots. In the same accounts, June, 1533 (Pitcairn's Crim. Trials), we find a sum of 12L. Scots entered to Bellenden 'for the new Cronikil given to the Kingis grace;' but whether this 'new Cronikil' was the chronological compendium of Scottish history written that year by a brother of the minor Observants at Jedburgh (Nicholson's Scottish Historical Library, p. 38), or Bellenden's own performance, does not appear. Bellenden's translation of the introduction of the book was also added and altered as he thought proper; and it again was put from the Scottish dialect, in which it was written, into English, with equal freedom, by Harrison. (Ap. Holinshed's Chron. vol. i.)

In 1527 the king's brother Arthur, who was a doctor of the canon law, and a licentiate in the civil, and the author of a book of Excerpts from the canon law, appears to have been appointed canonist of King's College. (Kennedy's 'Annals of Aberdeen.') The next year Boece himself took the degree of doctor of divinity in the University of Paris; and when the magistrates and town-council of Aberdeen voted him a present of a tun of wine, when the new wines arrived, or 20L. to buy a new bonnet. ('Council Register,' ap. Kennedy's Annals, vol. ii. p. 357.) The year following, a Nova Erection of King's College was issued for the better provision of its members, into which unquestionably the wisdom and experience of Boece entered, but to what extent is uncertain. He died at the year 1536, and was buried in the chapel of the college near the tomb of Bishop Elphinstone. In the front of the chapel is his coat of arms: a sable and chief, H. B. ob. 1536. (Kennedy's Annals.)

BEOCTIA was the ancient name of that part of the district of Livadia which was bounded on the west by Phocian, on the north by the Euboean, and on the south by Attica and the Halycean sea. This country may be described as consisting of two basins of very irregular form and of unequal dimensions, the valley of the Asopus, and the lower part of the vale of the Cephissus. The valley of the Asopus is bounded on the south by the range of Parnes and Chironom; the small basin of the Lake Hylike may perhaps be considered as belonging to this division, which contained the towns Thebes, Tanagra, Thespiae, Platea, and Ascea. The northern basin is completely surrounded by natural bounaries, inasmuch as it is supposed to be united to the Phocian. It included the lake Copais, and the towns Orchomenus, Charonea, Coronea, Lebadea, and Halieartus. The following resemblance or comparison has been suggested between the two natural divisions of the country: each of them had its lake and its river; and as those who dwelt by the Cephissus were called Epheciphiotis, so those who inhabited the marshy land near the Asopus were called Parasopit, perhaps also Parapomtii, as we learn from a passage in Euripides (Bacch. 667 Herm.). There was also a tribe of Parapomtii on the Cephissus. In ancient times the two valleys were under the separate dominion of the two towns which in each of them were most distinguished by their wealth and population. In the northern Orchomenus for a long time the inhabitants enjoyed certain privileges and customs in his barony, and paid them over to the great chancellery of Scot-
long time took the lead, and the city on the Isemus, under the different names of Cadmea and Thebes, was always the ruling power in the southern portion. On the coast of the Euboic sea were the towns of Anthedon and Aulis; and a few miles inland, on the bank of the river, the mountain of the same name, was the unfortunate Mycaleus.

According to the recent survey of Captain Copeland, a mountain wall lines the whole continental coast of the Euripus, from the valley of the Asopus to the flats at the outlet of the lake Sperchiuus. From Caria Stradus, which is immediately opposite to the inlet Celes Trales, this range of mountains runs westward and forms the boundary between the basin of the Cephisus and the Sperchiuus, known in former times as the range of Oeta. This high mountain-barrier, which separates the outlet of the lake Asopus, nearly as far north as the bold rocky coast of Cape St. John, from the north of the ruins of Larymna, belongs to the ancient Boeotia. The heights marked along this coast, beginning with that nearest to the mouth of the Asopus, are as follows: Mount Cupa 2409 feet, and one of these three is probably the Salganeus of Strabo. North of these elevations, still following the coast, the following are marked—1303, 2655, 2272, C. Skropo-neri 1315, 1630, hills near the ruins on the site of Larymna, 1556 feet. The whole length of the coast from Capa Stradus to the Thasian coast is described as about thirty miles. The coast of Euboea opposite to Styalama and Larymna rises still higher, and the narrow sea between the two coasts is in some places more than sixty fathoms deep. There is also deep water along the Boeotian and Euboic coast, from the outlet of the lake Asopus to the mouth of the river Atius. From the point where the contracted channel of the Euripus begins to widen again, a low tract which contains the outlet of the Asopus continues for some miles along the coast to where the high lands of the range of Paros abruptly rise. After describing the coast, Strabo observes (p. 405. Ca. saub. ' that the interior consists of hollow plains, surrounded on all sides by mountains; on the south of those of Attica, on the north by those of Phocis; on the west Citharon exists, and the Choeronea and Mount Helicon rise a little above the Cissalian Gulf, where it joins the mountains of Attica and Megaris, and then turning into the plain country subsides in the territory of Thebes.' The basin of the lake Copais must no doubt be at a considerable elevation. Thiersch asserts that the level of the lake Copais is more than 1000 feet above the sea, but this is an exaggeration, and the statement appears to be only a guess. This lake is the receptacle of an extensive drainage. The Cephisus, which rises in the high central mountains of this part of the country (p. 215. C. Alexand. ii. 5), flows in a south-east course into the lake Copais, which receives also the waters of the small streams of the Melas and Laphythus. The lake is separated from the sea by the range of Mount Poon, about four or five miles across. Between these two, on a much elevated plain, there are several channels, but the wells or shafts which communicate with them are now choked up. (See Thiersch, Etat actual de la Grece, ii. p. 23.) The great work for draining the lake is one of the oldest existing memorials of the civilization of the country. These conduits have become choked up from neglect, Crates of Chalaeis, in the time of Alexander, began to restore them, and he succeeded so far, in spite of the civil troubles, that the sites of the ancient Orchomenus and Eleusis were discovered. When Strabo says that the Cephisus changes its course into the lake Locris, he does not probably mean to say that this is a natural outlet. He says in another passage (p. 406) 'that a chasm having opened close upon the lake near Copas, made an underground passage for the stream thirty stadia long, which received the river. The Cephisus emerged at Larymna of Locris, where there is a lake of the same name, and entered the sea.' A small stream is marked in Captain Copeland's map near Larymna, which may probably be the stream mentioned by Strabo. The basin of the Copais contains a large amount of fertile land, capable of growing cotton and other crops in quantity. According to Dicaearchus, the length of Boeotia was 500, its breadth 270 stadia. Its surface is 1080 square miles, and its population, according to Mr. Clinton's deductions, was, in the time of Thucydides and Xenophon, 130,500 (Fast. Hel. ii. 392); but we do not consider either of these estimates as resting on any solid reason. If we admit the area to approximate to the truth, which we doubt, the population given is unreasonably low for a country which is very fertile, and was probably well cultivated, Kent, an agricultural county, which contains a very large proportion of land in corn, has a population of 481,000 on a surface of 1557 square miles. Xenophon says that the Athenians and Boeotians were on a par in point of population, but probably there were not so many slaves in Boeotia as in Attica. Boeotia was remarkable in ancient times for its extraordinary fertility, and we agree with Mr. Thirlwall in thinking that it was much admired for the richness and thickness of their atmosphere that depressed the intellectual and moral energies of the Boeotians, and justified the ridicule which their temperate and witty neighbours so freely poured on their proverbial 'sulking.' (Hist. of Greece, iii. 1) When the choice of a place in Greece was made for the name of sensuality, not for stupidity and dullness. Some of the principal productions and manufactures of the country are enumerated in the Acharnians of Aristophanes, v. 781 seq. The linen fabrics of Boeotia were held in great estimation, and the iron mines which were antiently worked in the eastern chain of mountains supplied the material for the famed Boeotian cutlery; hence we read in antient writers of Aonian iron, Aonian weapons, and helmets of Boeotian workmanship, when excellence is meant to denote a peculiarly fine quality.

There is perhaps no country of Hellas, with respect to the antient inhabitants of which so much and such complicated traditions exist. We may divide the earliest of these traditions into two classes, one including those which refer to the Boeotians, or to the inhabitants of the Egyptian region, and another containing those traditions to which we owe the old story of a Phoenician colony. It is very difficult to distinguish between truth and fiction in these narratives. With respect to the former class we are inclined to reject many of the statements altogether. The argument on which they are principally derived from the similarities existing between Egypt and Boeotia; the Melas used to overflow its banks like the Nile; the lake Copais was covered with swimming islands like those near Buto; the Nymphseion in Boeotia is the analogue of Memphis; the Pharaohs were equally celebrated for their linen manufactures, and the same veneration was paid to the eel in both countries. Besides, the name of the traditional king of Orchomenus, Minyas, is nearly the same with that of the first Egyptian monarch, Memes or Min. But the evidence is at all events quite fallacious, for the similarity of products may be sufficiently accounted for from other causes, and the fundamental worship of the Orcheomensians, namely, that of the Charies or Graces, had nothing corresponding to it in Egypt. The questions of the Phoenician earliest settlement in Boeotia, the traditions of Trophonius and Agamedes, and the story told in Herodotus (ii. 121) of the treaty of Rhamnusians, C. O. Muller has shown (Orchom. p. 100) that the former existed among the Triphylian Minyans before the time of Herodotus, and that the latter story points out to Greece became more intimate, and therefore that it could not have been derived from Egypt after that time. This does not indeed altogether remove the difficulty, for the story may have existed in Egypt at the time when the supposed colony sailed from Boeotia, and may have been carried thither; but when we consider how commonly the Egyptian priests appropriated the Greek legends, and how easily, when there was one point of resemblance between two legends existing in the different countries, they invented an identity, we may be less inclined to add to this the numerous forgeries with which they have impregnated the country of the Greek travellers.

The traditions of the second class, which are much older, and consequently more involved than the former, relate that Thebes was founded by a Phoenician prince named Cadmus, when in search of his sister Helen, who had been carried off by Jupiter. But this legend admits of the following plausible solution, which is due to C. O. Muller (Orchom. p. 118)—It was the custom of the Greeks to refer to Cadmus, when they had once transformed him from a Pelasgic into a Thracian or a Thracian prince, the Thracians in Greece and in the Aegean Sea. For example, the Phoenicians were the first workers of the gold mines in Thasos: hence Thasos is set down as a brother of Cadmus, and the relation of the Phoenicians to the Thasians is referred to the search after Europa. Similarly, as the Phoenicians taught the Greeks the characters of the alphabet,
the supposed Thonician, Cadmus, was made the personification of this action. Now it is not probable that Thebes, an inland town, which had no internal commerce, and where there was, in fact, in part, stagnation, should have been inhabited by the Phoenicians, who generally built no cities but as emporia for traffic. We are therefore thrown back upon the supposition that the whole story is a fiction, arising out of a misunderstanding of the completely Greek name Phoenix, and that Cadmus was the name of many deities, one of whom was called Phoenix Thebanus. The old inhabitants of Thebes were called Cadmeans, their city Cadmeia, and they carried this ethnic name with them into their colonies. Cadmus was probably a deity of the Tyrrhenian Pelagi, a tribe whom Müller considers to have been originally one and the same with the Cadmeans (Orchom. p. 121); and this appears to be confirmed by the etymology of the word κάμος (καβ, found in καβ-ων, εκαβων, κα-β-ον), and by what Herodotus says (i. 52) about the Pelasgic derivation of the word δεσ. Besides, the effect produced by Cadmus sowing the dragon's teeth, in the supposed Phoenician legend, is the same as that experienced by Jason. Now Jason is an Iolian Minyan, that is, a Pelasgian; therefore, if, as is generally supposed, a sameness of mythi argues a relationship of the people in which they exist, Cadmus and the Cadmeans were Pelasgians also. The Cadmeans, in every way celebrated in ancient poetry, and especially in the Greek drama, is purely mythical; the whole genealogy is nothing but the development of the idea of an offended primitive power, and a statement in the form of a narrative of the punishment of its revolters. (See Müller's Second Essay on the Eumenides, sec. 81.)

The Cadmeans and the cognate tribe of the Minyans occupied Boeotia till about sixty years after the taking of Troy, when they were driven out by the Boeotian Boeotians, and wandered for a time over the territory of the Cadmeans, and in the neighbourhood of the Pasageatic sea, who had themselves been forced to leave their settlements by the Thessalian immigration from Thesprotia. According to one tradition the Boeotians not only expelled the Cadmeans, but also slew the Thessalians, the Cadmeans having slain the Ascarataeans and other towns at the foot of Mount Helicon. These Thracians were a half-Greek people, and were connected with the Pierian Thracians, as is proved by their common worship of the muses, and their Orphic-Dionysiac rites. Their Dionysiacs however was not the same with the Cadmeans, who was represented as a co-deity of the Thcean Demeter. [See Bacchus and Demeter.] Thucydides says (i. 12)—The Boeotians who now inhabit the country were expelled from Arne by the Thessalians sixty years ago. They have no name, it seems, no country, called Boeotia, but formerly known by the name of Cadmea. He adds, parenthetically—There was however a portion of them (παρεκχωροντες) in this country, even before that time, and to this belong the Boeotians who took part in the expedition against Athens. Thucydides probably never drew up the catalogue of the ships, introduced the Boeotians into it merely to please the then inhabitants of that country, to whom his wanderings probably extended, and the remark of Thucydides is perhaps only a proviso to reconcile the historical geography of the period of which he was in his time considered incontrovertible. (See Müller's Orchom. p. 394.) The Boeotians having thus expelled the Minyans from Orchomenus, and the Cadmeans from Thebes, the former fled to Laconia, whence they were driven by their twenty years' occupation there, and took refuge some of them in Triphylia, others in Thessaly, and these at a later period went with the colony to Cyrene. (See Thrige's Res Cyrenenius.) The Gephyreans and the Aegidiots, who were priest-families of the Cadmeans, proceeded to Athens and Sparta; but the old Pelasgic people, the Cadmean commonalty, first went to Athens and afterwards to Thebes, Mantine, Samothrace, and the coasts of Aiolis. Twenty years after the Boeotian conquest of Boeotia, the Dorian invasion of the Peloponnesus took place, and the expelled Pelopids and Carians went to the Sic and Boeotia, were joined by so many of the Boeotian Boeotians, and the commonalty of this city was generally known by the name of the Aiolian or Boeotian colony. (Strabo, 402, c.)

We have only fragmentary information with respect to the Boeotian Boeotians, which from this time continued to be the inhabitants of Boeotia, nor are we able to speak with much certainty of the constitutions of the different towns, and of their relation to one another. We know from Athenians that the Boeotians were members of the Amphictyonic assembly, and we are informed by various authors that the Boeotian towns soon became members of a league of the Boeotians. The Boeotians were members of the confederacy of confederates met in the plain before Coroneia, at the temple of Athena of Iton; and this meeting took place at the festival of the Pambonotia. Every one of the confederate states was, as such, free, but several of them had smaller confederacies. This smaller confederacy of Thucydis, i. 68, and Dr. Arnold's note.) It is very difficult to determine the number of the independent states; but as we are told that at the ancient festival of the Daelias, which was celebrated every sixty years at Plataea, fourteen wooden images were carried in procession to the summit of Citharon, and as we know that seven was a holy number among the Boeotians, we may infer that fourteen was originally the number of the members of the confederation, just as we find in other states that holy numbers are made the basis of political divisions. (Müller's Orchom. p. 552; Nicholaus's Civitates. vol ii. p. 84, English translation.) The lay and religious ceremonies of the confederation were determined by drawing lots among the members, so that at any time one of the members determined the proceedings. (Thucydis, v. 35.) The Boeotian confederation was dissolved in B.C. 171, after having undergone many changes and fluctuations. (See Clinton's Fast. Heil, ii. 398, b.)

With regard to the form of government which prevailed in the several Boeotian towns, we have good reason for believing that it was the same with that of Thebes, which was in the historical times generally a rigid oligarchy. In or shortly after the 15th Olympiad, Phileotas, a Corinthian by birth, was sent as envoy to the members of the Boeotian confederation for the purpose of legislating, apparently with the view to correct some of those instabilities which were constantly taking place, and threatening to destroy the equilibrium of the ancien aristocracies. This object he seems to have effected by the institution of a form of government, and it is said that probably the adoption of younger sons from other families was insisted upon in cases where a member of the ruling caste had no offspring of his own, and so a diminution of the numbers of the privileged order was obviated. (Aristot. Pol. ii. 12.) The executive power was vested in an archon, chosen yearly by ballot. With such a government the Boeotians must naturally have been opposed to the neighbouring democratic state of Attica; and accordingly we find them about the year 507 B.C. joining the Peloponnesian and Chalcidians in an attack upon the Athenians (Herod. v. 540), and afterwards, in 475 B.C., they joined them against Athens. The Peloponnesian war, and the Sullan war, and two of the Roman civil wars, as well as our own war, form a link between the two great. A form of government was restored (see Aristot. Pol. v. 2, comp. v. 6.), and the signal defeat sustained by the Athenians at Coroneia freed Boeotia from her foreign yoke. The Thebans were active partizans of Sparta in the Peloponnesian war, and contributed materially to the downfall of Athens; but in the year 395 B.C., they became members of the confederation against Macedon, which was broken up in the course of the
following year by the victory which Agis I gained over them at Coronea. The Peace of Antalcidas was followed (397 B.C.), and five years after the treacherous sedition of the Cadmeans or citadel of Thebes, by Phocidas the Macedonian and its subsequent recovery by Pelopidas, brought about another war between Boeotia and Lacedaemon, in which the armies of the two powers met and the Boeotians, led by Phocidas, made Boeotia the leading power in Greece. But the former fell at Mantinea, and the power of Thebes fell with him. The Macedonian influence now began to prevail: Athens and Thebes were overthrown by Philip at Chaeronea (338 B.C.); and his thuggery after the latter city was entirely destroyed by Alexander the Great, and its territory divided among the Perioeci. In the year 315 B.C., Cassander rebuilt Thebes, with the zealous co-operation of the Athenians, but it never regained its political importance. But its site remains to this day as the capital of Perseus, but it dwindled away to a mere nothing under the Roman dominion. (Pausan. viii. 33. 1.)

Notwithstanding the proverbial dullness of the Boeotians, some of the great writers of Greece were natives of this district. Hesiod was born at Acasta, Corinna at Tanagra, Pindar at Cynonopechale, and Ptilarchus at Chaeronea.

We refer those who wish to investigate fully the difficult subject of the early history and government of the Boeotian towns to C. O. Müller's work, Orkomeno und die Minger, Berlin, 1832; and the admirable articles by A. Klitz, De dictatore Boetic[ico], Berlin, 1821; and to Weis-Christmas. Allerthein. J. v. p. 128.

BOERHAAVE, HERMANN, was born on the 31st of December, 1668, at Voorhout, a village two miles from Ley- den, the second son of a stonemason. Being designed for the church, he was instructed by his father in the classical languages, and at the age of eleven he was already able to translate both Greek and Latin with tolerable accuracy. About this time an accident occurred which caused him to abandon his career in the church. Who, more than once, was thrown into a lake, was no more troubling than the disease. Tired of these useless experiments, he took the management of his case into his own hands, and finally effected a cure by dressing the ulcer with salt and urine. Partly for the sake of his education, and partly that he might have the benefit of surgical advice, he was taken by his father in 1682 to Leyden, where he was placed in the fourth class of the public school. His genius and industry soon raised him to the sixth, from which it was usual, after six months, to be transferred to the university. He entered the latter at least in 1687, his father died, leaving a very slender provision for his widow and nine children. Triglandis (one of his father's friends, who was soon after made professor of divinity at Leyden) recommended young Boerhaave to Van Alpen, in whom he found a more amiable and generous patron.

Greek, Latin, Hebrew, Chaldee, with antient, modern, and ecclesiastical history, and the mathematics, were among his more especial studies, and he soon began to give public proofs of his eloquence and erudition. In 1688 he was chosen by the University of Leyden as one of the professors of Greek. (Oratio academica, quæ probatur, bene intellectam ad Ciceronem, et confutatam esse, sententiam Epicuri de summo bono. Lugduni Bat. 1690.) In 1689 he took the degree of doctor of philosophy, the subject of his inaugural thesis being, "Physica et Mechanica." That year, 1689, his father died, leaving a very slender provision for his widow and nine children. Triglandis (one of his father's friends, who was soon after made professor of divinity at Leyden) recommended young Boerhaave to Van Alpen, in whom he found a more amiable and generous patron.

Greek, Latin, Hebrew, Chaldee, with antient, modern, and ecclesiastical history, and the mathematics, were among his more especial studies, and he soon began to give public proofs of his eloquence and erudition. In 1688 he was chosen by the University of Leyden as one of the professors of Greek. (Oratio academica, quæ probatur, bene intellectam ad Ciceronem, et confutatam esse, sententiam Epicuri de summo bono. Lugduni Bat. 1690.) In 1689 he took the degree of doctor of philosophy, the subject of his inaugural thesis being, "Physica et Mechanica." That year, 1689, his father died, leaving a very slender provision for his widow and nine children. Triglandis (one of his father's friends, who was soon after made professor of divinity at Leyden) recommended young Boerhaave to Van Alpen, in whom he found a more amiable and generous patron.

About this time, having exhausted his scanty resources, he sought the invaluable means of enabling him to continue his studies. Without giving up his intention of entering the ministry, he now began the study of physic by a diligent perusal of Vesalius, Bartholinus, and Fallopio; he was a constant attendant at the dissections, and examined the anatomy of different animals himself. After he had gone through a course of medical reading, finding, as he tells us, that Hippocrates was the fountain of all medical knowledge, and that all later writers were little more than transcribers from him, he returned to him, and spent much time in making extracts from his writings, digesting them in order, and fixing them in his memory. Among the moderns none engaged him longer, or with more delight, than Sydenham, and he has left the testament, 'that he persuaded him frequently and each time with greater eagerness.' He prosecuted chemistry and botany with equal ardour, and, in conjunction with all these inquiries, still pursued his theological studies. He took the degree of doctor of philosophy at Leyden in 1693, having held a public dissertation 'De utilitate exploratorum excrementorum in aegris, ut signorum.' (Harde-wick, 1693; Lugduni Bat. 1743.) He now returned to Leyden with the design of undertaking the ministry, but was diverted from his laudable purpose by a singular event. A short time before, Boerhaave happened to be in a public boat, when a conversation arose among the passengers concerning the doctrines of Spinosa, which, as they all agreed, were opposed to the latter's orthodoxy and religion. At last one of them began to inveigh against Spinosa in a strain, that Boerhaave, weary with his angry invectives, asked if he had ever read the author against whom he was declaiming. The speaker was shocked in the midst of his invectives; this was observed by a stranger, who, inquired the name of the young man whose words provoked him, and to the discourse, and set it down in his pocket-book. In a few days it was the common talk at Leyden that Boerhaave had gone over to Spinosa. Had Boerhaave been at this time a man ofrong design of entering the church, it is difficult to conceive that this absurd report could have made him change his resolution. It seems more probable that, feeling himself eminently skilled both in theology and physic, he was wavering in his choice of a profession; and that the unimportant event of the slightest weight will turn a loaded but well-balanced beam, so over the breath of a slanderer made Boerhaave a physician.

He now commenced the practice of physic, and his time was taken up with visiting the sick, studying, making chemical experiments, and even engaging in a branch of medicine to which the utmost diligence, teaching the human form, and reading the Scriptures. In 1701 he was recommended by Van Berg to the university as a proper person to succeed Drelincourt in the lecturership of the theory of medicine. In 1702 he became professor of materia medica, and his inaugural discourse was on the study of Hippocrates. (Ora- liones commendando studio Hippocratis, Lugduni Bat. 1701.) His lectures were received with great applause, and he was soon prevailed upon by his audience to enlarge his original do-

itn, and instruct them in the ministry. This he undertook, not only to the advantage of his pupils, but to that of the science itself.

It was then, in 1703, that he delivered his lecture 'De usu ratiociniis mechanicis in medicina,' and also began, in 1706, his History of the Human Body. Boerhaave's object was to observe, and to intrude mechanical speculations into the domain of the art of healing. Thus he supposed that the adaptation of the calibre of the vessels to the size of the globules of the animal fluids was the principle which regulated the circulation of the blood. He supposed that the fluids from the blood in the different organs of secretion, as well as the morbid condensation of the blood in defluxions, tumours, and inflammations; so that, in the treatment of disease, all the efforts of the physician were to be directed to the re-establishment of this mechanical equilibrium, and the medicines given with this intention were called deobstruents, incises, &c. To these mechanical hypotheses he joined chemical ones; thus he supposed many morbid phenomena to arise from acrimony of the blood, which it was the business of the physician to remove by various medicines. The various forms of morbid pathology, as it is called, though banished for a time from the schools, has always kept its hold on popular belief, and bids fair to revive again. Late investigations into animal chemistry have shown that certain deviations from the healthy composition of the blood accompany, if they do not produce, certain diseases. Thus in jaundice the blood contains both the colouring matter and the resin of the bile; in gout the blood is loaded with earthy phosphates; and in cholera it is deficient both in water and in alkaline salts. One of all these symptoms is phlegmatism: chlorosis: in this disease, where the sickly pallor of the patient would naturally be attributed by the ordinary observer to deficiency or poorness of the blood, we find a singular deficiency of colouring matter: a thousand parts of blood, which ought to contain 133 parts of colouring matter, in one case contained only 58; another but 48 7. (Jennings on

Boehm had now began to bear some proportion to his merit, and accordingly in 1703 the professorship of physic being vacant at Groningen, he was invited thither, but he preferred remaining at Leyden.

He had now read lectures on physic for eight years without obtaining the chair of medicine and botany vacant by the death of Hottot. His inaugural discourse was on simplicity in the practice of physic. 'Oratio qua repugnante medicina facitis assurrit simplicitas,' Lugduni, Bat. 1709. At this time he also published the 'Institutiones medicinae in usum annuum exercitationis domesticos,' Lugdun. Bat. 1708, 1713, 1720, 1727, 1734, 1746; and Lutetiae, 1722, 1737, 1747; and the 'Aphorismi de cognoscendi et curandi morbis, in usum doctrinum medicinae.' Lugduni, Bat. 1709, 1715, 1718, 1720, 1725, 1728, 1730, 1734, 1746.

On these two great works the reputation of Boehmave is founded: they have been translated into several European languages and even into Arabic; and Van Swieten, himself a physician of no ordinary talent, illustrated the aphorisms with a commentary extending to five quarto volumes. Haller published a commentary on the 'Institutiones' in seven quarto volumes, Leyden, 1750; and Lamettrie published a French translation with notes, 'Institutions et Aphorismes,' Paris, 1743, 8 vols. 12mo.

Boehmav, as this work indicates the plan of study to be followed by a physician; he gives a compendious history of the art, and an account of the preliminary knowledge which is necessary for its practice; then, entering upon his subject, in five successive chapters he describes the symptoms and signs of the health and disease of the body, and the signs of signs of health and disease, together with hygiene and the art of prolonging life. Lastly, he treats of the aids which art affords to medicine; here he details the system on the principles of which we slightly touched above. It was the literature of foreign medicine and the observation of the fact that had hitherto been taken; a model of erudition and method, embellished rather than encumbered by his opinions on the acrimony of the fluids, and his mechanical and hydraulic theories. In his 'Aphorismi, Boehmav gives a classification of diseases, and draws from his own observations, their treatment, with a short but accurate summary of the whole of antient and modern medicine. This, like the former work, is a masterpiece of learning, order, and correctness of style.

But we must remember that his botany, which he held with that of medicine, by the publication of his 'Index Plantarum que in horto academico Lugduno-Batavo repeenturum,' Lugduni, Bat. 1710, 1718, 8vo. An enlarged edition of this work, with plates, appeared in 1720, under the title of 'Index Plantarum que in horto academico Lugduno-Batavo aluntur,' Lugduni, Bat. 1720, 4to, 1727, 2 vols. 4to.

Boehmav greatly increased the number of specimens in the botanical garden; he figured new plants, established new genera, and was one of the first to have observed the sexual differences among their characteristic distinctions.

In 1715 Boehmav was made rector of the university of Leyden, and in the same year was appointed physician to St. Augustine's Hospital, and professor of practical medicine, having already delivered the lectures more than ten years. Twice a week he gave clinical lectures at the hospital, and, like other great physicians, forgetting his theories for awhile, distinguished and treated the complex forms of disease before him with that unrivalled tact which stamped him as a genuine physician. During his first term of office of rector, Boehmav delivered one of his finest orations, 'Oratio de comparando certo in physica,' Lugduni Bat. 1715, 4to.

He already held the chairs of theoretical medicine, practical medicine, and botany, and on the death of Lemort in 1718, that of chemistry was added to the number, a subject on which he had lectured since 1703. In conformity with his custom, he opened his course by a general discourse worthy of his other performances of that kind, 'Oratio de chemia suo usu et expugnante,' Lugduni Bat. 1718, 4to.

Boehmav was one of the first who made chemistry delightful and intelligible; and though the rapid progress of the science has made his works on this subject obsolete, he will ever be mentioned with veneration in its history. He excelled in experiments, and repeated them with unwearied patience; he performed one experiment 300, and another 877 times. He was skilled in organic chemistry, and showed how the animal fluids might be composed of simpler substances. He was the first who gave distillation over the open fire, in the manner then practised. The fame acquired by his elements of chemistry may in some measure be judged by the following list of his works:—

'Elementa Chemiae quae anno 1721 in publicam inedita,' Bat. 1722, 4to.; 'Elementa Chemiae quae anno 1723 in publicam inedita,' Bat. 1732, 4to.; 'Elementa Chemiae quae anno 1733 in publicam inedita,' Bat. 1733, 2 vols. 4to., with the author's minor works: another edition printed at the Hague in 1746, in 8vo., translated into French by Allamand and enlarged by Tarin, Paris, 1754, 6 vols. 12mo.; 'Commentum medendi tum ad fœniculam, ovide et ovide de fœniculam, ovide de Abridged de la Théorie Chimique tîre des écrits de Boehrave, avec le Traité du Vorticel,' Paris, 1741, 12mo. There are also English editions published in 1733 and 1741, and an abridgment with critical notes in 1739.

The same year of weighing Boehrave's merits as a chemist must not consult the editions printed before 1732, as they were published merely from his pupils' notes. Boehrave, of course, was not pleased with the indiscreet zeal of his pupils, who often published works which in his opinion were not yet ripe; he complains of it in the Leyden Gazette for 1726.

So many offices discharged with unparalleled success obtained for Boehrave a reputation which was almost without a precedent, and which scarcely leaves the picture of the civilized world. The learned of every part of Europe corresponded with him, and every academy desired to be honoured by dissertations from the hand of the most distinguished master of his art. There is a story that a Chinese mandarin wrote him a letter, which easily could have been addressed to Boehrave.

The anecdote may be apocryphal, but it shows the universality of his fame. Much of his time was of course taken up with patients, some of whom came to consult him from the most distant countries of Europe; and in answering letters, which he was obliged to write, he was called upon to ask the advice of the first physician in the world. The pecuniary proceeds of his practice must have been enormous, for at his death he left more than two millions of florins. He was elected a corresponding member of the Academy of sciences at Paris 1715, and for some years held an associate seat in 1728; in 1730 he was elected a fellow of the Royal Society of London. He communicated to the Royal Society and to the French Academy some observations on mercury, which were published in the Transactions of the French and in the Memoirs of the Academy of Sciences for 1734.

In 1722 his course both of lectures and practice was interrupted by the gout, which he brought upon himself, he says, by an imprudent confidence in the strength of his health. His residence in the hortus academicus was a thousand times inoculated upon his friends and pupils. Rising before day-break, he had gone hot and perspiring from his bed into the open air, and exposed himself to the chill breezes of the morning. In consequence of his illness he had to remain for some time in his bed, and by any effort renewed his torments, which were so exquisitely, that he was at length not only deprived of motion but of sense. In the sixth month of his illness, having obtained some remission, he took simple medicines in large quantities, and got well. His unexpected recovery was celebrated on the 11th January, 1723, by a public illumination. Fresh attacks of illness in 1727 and 1729.shattered his constitution and forced him to resign the professorships of chemistry and botany: on this occasion he delivered the lecture entitled 'Oratio de comparando certo in physica,' already published.

He was again elected rector of the university, and on quitting this honourable office he delivered a discourse on the subserviency of the physician to nature. 'De honore medicæ servitutis,' Lugduni Bat. 1729, 4to. About the middle of 1737 that illness began which proved fatal. In a letter to a friend in London, dated September 8th, 1738, he details the symptoms with a masterly hand; and it appears clearly from his description that he was labouring under organic disease of the heart and lungs, accompanied by concomitants of general dyspepsia, disturbed sleep, and a disposition to a sense of suffocation. He expired on the 23rd of September, 1738, in his seventieth year.

Boehrave was the most remarkable physician of his age, perhaps the greatest of modern times: a man who, when he contemplated his genius, his erudition, the
singular variety of his talents, his unaffected piety, his spotless character, and the impress which he left not only on contemporaneous practice, but on that of succeeding generations, stands forth as one of the brightest names on the page of history, and may be quoted as an example not only to posterity, but to all noble families in the hope of a robust and athletic constitution of body," says Hutchinson. "So hardening by early severities and wholesome fatigue, that he was insensitive of any sharpness of air or inclemency of weather. He was tall, and remarkable for extraordinary strength. In the course of the Rhetorica, he sometimes spoke rough and artless, but so majestic and great at the same time, that no man ever looked upon him without veneration, and a kind of tacit submission to the superiority of his genius. He was always cheerful and desirous of moving mankind. His education was derived from nature and study; he never soured by calumny and detraction, nor ever thought it necessary to confute them; "for they are sparks," said he, "which, if you do not blow them, will go out of themselves." The town of Leyden, which, on his recovery from his first illness, had given him so signal a proof of its affection, erected a monument to his memory in St. Peter's church.

He married, September 10th, 1710. Mary Dolenveex, the only daughter of a burgomaster of Leyden, by whom he had four children, of whom one alone, Joanna Maria, survived him, and herself also in their infancy.

In addition to the works which we have already mentioned, he published the following:—"Oratio de Vi et Obitu Clarissimi Bernhardi Albini," Lugduni Bat. 1721, 4to.—"Epistola ad Ruysschium Clarissimum pro Sententia Multiplici," Lugduni Bat. 1721, 4to.—"Epistula ad Gracchum Clarissimum de Rebus Medici," Lugduni Bat. 1722, 4to.—"Descripti prius Morbi Historiae," in "Nouv. Medicinae Artis Leges conscripta," Lugduni Bat. 1751, 8vo.—"Atroci Rarissimique Morbi Historia Altera," Lugduni Bat. 1728, 8vo.

The following works have been attributed to him, but are not recognized as genuine in his own catalogue; many of them were in fact surreptitious editions of parts of his lectures, of which some did not appear till after his death:—"Tractatus de Peste."—"Consultationes Medicinae, sive Sylloge Epidemiarum cum Responsis;" the first edition was published at Louvain in 1743, but it has been frequently reprinted. —"Praxis Medica," Leide, 1730, 8vo.—"De Virtus Medicamentorum," taken from the notes of his lectures in 1711 and 1712.—Paris, 1723, and many other editions.—"Experimenta et Institutiones Chemicae," Lutetiae, 1728, 8vo., taken from his lectures from 1718 to 1724. —"Methodus Dissertandi Medicinae," Lugduni Bat. 1733, 4to.—"Methodus Disserti Medicinae, seu De Accessionibus locupletatissima," Lugduni Bat. 1739, 4to.—"Health and Writings, and the true voice of the true doctor," written by Haller, who published it in two volumes, 4to., in 1731, under the title of "Hermanno Boerhaave, Viro Summi,ique Praecipue, Methodi Studii Medicinorum et Accessionum locupletissimorum Medicos et Patrons," etc., quam rerum et verborum, cum Cornelius Peregrino, which is well to annex to it.—"Historia Plantarum qua in Horto Academico Lugduni Batavorum crescent, printed at Leyden in 1712, but with Rome on the title-page. There are London editions of 1721 and 1728, taken from his lectures from 1709 to 1728.

To these we may add an anonymous "Index Plantarum;" "Commentaries on the Aphorisms," 1728, 8vo.—"A Lecture on the Stone," London, 1740; and the "Lectures on Diseases of the Skin and Venereal Maladies," 1734, 8vo. The works which he edited are—the works of Drelincourt; the observations of Puss; the anatomical and surgical works of Vesalius, edited in conjunction with Albini; the "Tractatus Medicus de Loco Veneris," published by Apodiscus; the smaller anatomical works of Eustachius; Bellini, "On the Urine and Pulse;" Prosper Alpinus, "On the Prognosis of Life and Death;" and the celebrated edition of Aristeus.

These works came out under the auspices of Boerhaave, whose influence could never have been published but for his friendly aid: these are—"The Physical History of the Sea," by Count Marsigli, Amsterdam, 1725, fol.; the "Botanica Parisiensis," by Le Vaillant, when dying sent him the MS., Leyden, 1737, fol.; and Swammerdam's "History of Insects," printed at Amsterdam in 1737 in two volumes, folio, with plates, and a preface by Boerhaave.
the ecliptic, upon a movable sphere; and the other (a clepsydra) indicated the hours of the day by the dropping of water from one vessel into another. Gondobald was well pleased with these contrivances, that upon his return home he dispatched ambassadors to Theodoric, praying that he would procure for him the two wonderful time pieces which he had seen at Rome. The letter which Theodoric wrote to Boethius on this occasion, expressing Gondobald's wish, and requesting the philosopher's compliance, is preserved by Cassiodorus.

During the course of these transactions Boethius lost his wife Elpis, but married a second time, Rusticiania, the daughter of Symmachus, along with verse, in the year 537, he was a third time elected consul. It was during this consulship that he fell under the displeasure of Theodoric. Theodoric was an Arian; and Boethius, who was a Catho-
lic, published about this time a book upon the unity of the Trinity, in opposition to the Arians, Nestorians, and Sut-
chians. This treatise, which was universally read, made him many enemies at court, who insinuated that Boethius wanted not only to destroy Arianism, but to effect a change of government, and deliver Italy from the dominion of the Goths. From his credit and his influence he was represented as the most likely person to bring about such a revolution.

While his enemies were thus busied at Ravenna, they employed emissaries to sow the seeds of discontent at Rome, and to excite factious people to oppose him there in the ex-
ercise of his office of consul. Boethius, in his eagerness to promote the public welfare, but his in-
tegrity and steadiness only hastened his fall. Theodicor,
corrupted probably by a long series of good fortune, began now to throw off the mask. This prince, though an Arian, had not an equal proclivity to the Luxuria of his time towards the Catho-
lics; but probably fearing that they had an intention to
overthrow his government, he began to treat with them severely. Boethius was one of the first who became a victim to his rigour. He had continued long in favour with his prince, and was regarded by him as any other person; but neither the remembrance of former affection, nor the absolute certainty which the king had of his innocence, pre-
vented him prosecuting the philosopher, upon the evidence of three persons of infamous reputation. 'The offence laid to his charge,' says Favorinus, 'the first book of the Consolat
ion of Philosophy, were, 'That he wished to preserve the Senate and its authority: that he hindered an informer from producing proofs which would have convicted that as-
sembly of treason; and that he formed a scheme for the revolu-
tion of the Roman liberty.' In private letters also, the witnesses had forged letters which they averred
had been written by Boethius. For these supposed crimes, as we learn from the same authority, he was, unheard and undefended, at the distance of five hundred miles, proscribed and executed.

The severity would be blamed, did not at this time carry his sentence fully into execution, but contented himself with confiscating his effects, banishing him to Pavia, and there
confining him to prison.

Soon after the Justin, the Catholic emperor of the east, finding himself thoroughly established upon the throne, published an edict against the Arians, depriving them of all their churches. Theodoric being highly offended at this edict, obliged Pope John I., together with four of the prin-
cipal sees of Rome (among whom Symmachus, the fifth son of John of Ravenna, goto an embassy to Constan-
tinople, and commanded them to threaten that he would abolish the Catholic religion throughout Italy, if Justin did not immediately revoke his edict against the Arians. John was received at Constantinople with pomp, and treated with respect. He tried to compromise matters between the two princes; but so far was he from inducing Justin to re-
voke his edict, that, in compliance with the tenor of it, he recon-
ciled many of the Arian churches to the Catholic faith.

Theodoric became so incensed at the conduct of Pope John and his ministers, that upon that occasion he cast his whole
army into prison. Boethius, though innocent of what was done at Constantinople, was at the same time ordered into stricter confinement at Pavia, the king having probably come to the resolution of proceeding to extremities upon this account.

Though confined in prison, and deserted by the world, Boethius preserved his vigour and composure of mind, and wrote during his confinement, in five books, his excellent treatise on the 'Consolation of Philosophy;' the work upon which his fame chiefly rests. He had scarcely concluded this work, or, according to some of his commentators had not concluded it at all, when Pope Florus, Symmachus and the other senators put to death, Theodoric ordered Boethius to be beheaded. His execution took place in prison, Oct. 23, 526. His body was interred by the inhabitants of Pavia, in the church of St. Augustine, which near the time of his death had existed till the last century, when that church was destroyed. The tomb had been erected to him by Otho III. in 996. Theodoric, who did not long survive Boethius, is said in his last hours to have repented of his cruelty. Gibbon (Decline and Fall of the Roman Empire, chap. xxxix.), says, the tower of Boethius subsisted at Pavia till the year 1584.

The most celebrated production of Boethius, 'De Conso-
latione Philosophiae,' has always been admired both for its elegance and sublimity of style. It is a book written on rationally between the author and Philosophy personified, who endea-

vour to console and soothe him in his afflictions. The topics of consolation contained in this work are deduced from the tenets of Plato, Zeno, and Aristotle, but without any notice of the sources of consolation which are peculiar to the Christian system, which circumstance has led many to think him more of a Stoic than a Christian. It is partly in prose and partly in verse; and was translated into
Saxon by King Alfred, and illustrated with a commentary by the afterwards celebrated Bede. An English version of this work was made by John Walton, canon of Oseney (commonly called John of Oseney) in 1410 are preserved among the Harleian manuscripts in the British Museum. Chaucer and Queen Elizabeth were also trans-
lated. The first English translation was printed by Colville, or Coldewell, Richard (Graham) Vyscomt Preston, W. Causton, the Rev. Philip Ridpath, and R. Duncan of Edingburgh. King Alfred's translation into Saxon was published at Oxford in 8vo., 1698, by Mr. Christopher Raw-
linson. The English version of this work was translated into English by J. S. Cardale, 8vo. Lond. 1629. A translation into French by Jean de Meun, was printed at Paris by Verard in 1494. Few books were more popular than this treatise in the middle ages; and few have passed through a greater num-
ber of editions in almost all languages. The first English

version of Boethius 'De Consolatione,' was printed at Nuremberg in 1476, in folio. The best edition of Boethius's whole works is that 'cens commentariis, enarrationibus, et notis Jo. Marmellii, Rodolphii Agricoli, Gilberti Porretae, Hen-

folio, at Basle in 1570. (See the note prefixed to a translation of the Treatise De Consolatione, 8vo., Lond. 1785; Chalmers's Biogr. Dict., vol. v. p. 509-514; Fabrec.

Bibl. Lat. 4to. Ven. 1778, tom. ii. p. 146-165; Brucker

Philologiae Histor.; and Baillat, Vies des Saints, vol. vii. p. 365, in which work 'Saint Bocce is included, '13 Oc
tobre.'

BOG. The name of bog has been given indiscriminately to very different kinds of substances. In all cases the ex-
pression signifies an earthy substance wanting in firmness or consistency, which state seems to arise generally (perhaps not always) from the presence of a superabundant supply of moisture having no natural outlet or drain.

In some cases, when springs of water, or the drainage from an extensive area, are pent up near the surface of the soil, the water collects in these places, and the soil state the land is perhaps more properly called a quagmire. A second state of bog is where, in addition to the condition just described, a formation of vegetable matter is induced, which dying and being reproduced on the surface, assumes the state of a spongy mass of sufficient consistency to bear a considerable weight. Bogs of this description are nume-
rous and extensive in Ireland, where they are valuable from the use made of the solid vegetable matter, both as fuel and as a principal ingredient in composts for manures. Where the surface of the bog is embanked, and the water which has been reclaimed by draining; and the subsoil is then readily brought into cultivation. Bogs also occur in all parts of Great Britain where the form of the surface and the nature of the earth favour the general condition under which they are found. The water in the granite plateau of Cornwall, on the road from Launceston to Bodmin; and in the large granitic mass, of which Brown Willy is the centre, the bottoms of the valleys are covered with bogs, the lower part of which is consolidated into peat.
Although peat moss always springs from some moist spot, it will grow and spread over sound ground, and if not stopped by some natural or artificial impediment, such as a wall, wood, or fence, it will spread over the whole extent of the fen in any moisture which reaches it, and retains it like a sponge.

The depth of a bog depends on the level of the surrounding grounds. It cannot rise much higher than the lowest outlet for the water. Where there is no immediate outlet the stream, or where the springs of the canal are not sufficient to supply the springs and rains, or till it rises to a level with its lowest boundary, where it becomes the source of a stream or river, and forms a lake. The mud being deposited at the bottom, gradually becomes a true peat, or is quite reduced to its eleventh or twelfth part in a bog. In this case it may become a stratum of rich alluvial soil, some conviction of nature may lay dry, for the benefit of future ages.

From this circumstance has arisen the great advantage of draining bogs, to which the attention of agriculturists and inspectors of drainage is directed. This subject is treated in the article on DRAINING.

The bogs of Ireland are estimated in the whole to exceed in extent two millions eight hundred thousand English acres. The greater part of these bogs may be considered as forming one connected mass. If Wicklow head on the east coast to Galway, and another line from Howth head, also on the east coast, to Sligo, the space included between those lines, which would occupy about one-fourth part of the entire superficial extent of Ireland, would contain the superlative extent of the peat; or the mass of bog is composed of mere mountain-bogs, and of bogs of no greater extent than 800 English acres. This district resembles in form a broad belt drawn east from west across the centre of Ireland, having its narrowest end nearest to Dublin and gradually increasing in breadth as we go out to the sea or to the ocean.

This great division is traversed by the river Shannon from north to south, which thus divides the great system of bogs into two parts. Of these, the division to the west of the river contains more than double the extent of bogs of any other division. The Shannon traverses the Shannon valley, and that the supposed Shannon valley, and that the original extent of the Shannon valley is from one great morass, on the contrary, the bogs to which it is applied are perfectly distinct from each other, often separated by high ridges of dry country, and inclining towards different rivers as their natural directions for drainage.

The surface of the land is very quickly from the Bog of Allen on all sides, particularly to the north-west, where it is composed, to a considerable depth, of limestone gravel, forming very abrupt hills. In places where the face of the hills has been opened the mass is found to be composed of rounded particles of limestone varying in size from a minuter to less than one inch; the largest pieces are not so much rounded as the small, and frequently their sharp angles are merely rubbed off. They are usually penetrated by contemporaneous veins of Lydian stone, varying in colour from dark to light grey, and always containing streaks of light grey, usually light smoke grey, rarely bluish black; when it is bluish black, the fracture is large conchoideal; that of the grey is uneven, approaching to earthy. The Lydian stone, when unattached to the limestone, has usually a tendency to a phloiodal form, sometimes cubical; the edges are more or less rounded; the longitudinal fracture is even, the cross fracture is conchoideal.

The Grand Canal from Dublin to Shannon Harbour passes through a considerable part of the great bog-district of Ireland. In forming this canal it was necessary to make considerable embankments, the surface-water of the canal being generally on a higher level than the surface of the immediately adjoining bogs. Where this was not the case, it was taken of the circumstance to conduct the drainage of the bogs into trenches for the supply of the canal.

The bogs situated to the south of the great belt in the centre of Ireland occur in Tipperary, Kilkenny, Clare, and Limerick. This belt of bogs, which has a broad belt occur in Antrim, Down, Armagh, Tyrone, and Londonderry.

It appeared from the examination of the surveyors appointed by parliament in 1810 to investigate the nature and extent of the bogs in Ireland, that they consist of a subject of the peculiar subsoil, and the average thickness of twenty-five feet, no where less than twenty feet, and some found to exceed forty-two—this substance varying materially in its appearance and properties in proportion to the depth at which it lies: the upper surface is covered with moss of various colours and textures, the fibres of moss, still visible though not perfect, and extending to a further depth of perhaps ten feet under this. At a greater depth the fibres of vegetable matter cease to be visible, the colour of the turf becomes blacker, and the substance much firmer and lighter. It is next to the surface, its composition is more changeable and variable, and gradually increasing in the degree of blackness and compactness proportionate to its depth; near the bottom of the bog it forms a black mass, which, when dry has a strong resemblance to pitch or bituminous coal, having a conchoideal fracture, and forming very distinct parts, not liable to be disturbed when the whole body of moss occurs on low ground, a fact which seemed to strengthen the opinion of their having always originated from the decay of forests. This theory of the original formation of bogs was by some time generally adopted, but the result of more recent investigations shows that it cannot be supported. That some bogs may have been formed in this manner is not denied. It is stated in the Philosophical Transactions, No. 275, that—"The Romans under Osiusius, having gained many losses in the mountains, did fill them so with the salt of the sea, in Yorkshire, which at that time overspread all the low country; and the conqueror, taking advantage of a strong south-west wind, set fire to the pitch trees of which the forest was chiefly composed, and when the greater part of the trees were thus consumed, the Romans sent Britons cut down the remainder, except a few large ones, which were left growing as memorials of the destruction of the rest. These single trees did not long withstand the action of the winds, but falling into the rivers intercepted the water, which, when it reached the sea, filled the flat country; hence the origin of the mosses and moor bogs which were afterwards formed here. This moorland near Hatfield, seven miles north-east of Doncaster, and about Thorne, is now a boggy peat covered with heath, and full of clefts, higher than the adjoining land, and very wet; whence it has been aptly compared to a sponge full of water. The Thorne waste with some adjacent tracts, and the Hatfield moor, contain about 12,000 acres."

In the Ordnance Survey of the County of Londonderry, presented by Major Mathew, to the British Association during its recent meeting (Aug. 1835) in Dublin, are some remarks on the subject which are deserving of attention:—

'In the production of bog, sphagnum' is allowed on all hands to have been a principal agent, and superabundant moisture the usual cause. To this subject various opinions have been advanced, more especially that of the destruction of large forests, which, by obstructing in their fall the usual channels of drainage, were supposed to have caused an accumulation of water. That opinion however cannot be supported. In the Bag Reports, such trees as are found have generally six or seven feet of compact pest under their roots, which are found standing as they grew, evidently proving the formation of pest to have been previous to the growth of the trees,

* Sphagnum palustre.
When bogs become consolidated or compressed, they are called peat-mosses. The consolidation here mentioned must be distinguished from that of sustaining a growth of timber as it is seen to have frequently borne.

Successive layers of trees (or stumps) in the erect position, and furnished with all their roots, are, as stated in the preceding section, cut and buried in layers at short distances, and at a small vertical distance from each other. It appears that the consolidation of the lower portion of the turf was a necessary preparation for the first growth of timber, and considering the huge size of the roots thrown out by these trees, and the extent of space over which they sprouted, it is as a mode is readily perceived by which they obtain a basis of support sufficiently firm and extensive to uphold their rising and increasing stems. The first layer of turf was now matted by the roots, and covered by the trunks of the first growth of trees, the third or second course of trees was matted, and to accumulate round the growing stem, a new layer of turf was created to support a second growth of timber, the roots of which passed over those of the preceding, and so on with a third or more, until at length the singular spectacle was exhibited of several stages of trees growing at the same time. Such seems a natural way of viewing the subject, but it is often stated that one stump is found actually on the top of another, which would imply that the lower tree had been destroyed before the turf had ascended to the top of the stump. In such an instance, using Mr. Griffith's example of the rate of increase of recent bog, and supposing it compressed by growth into one-fifth of its original bulk, little more than one hundred years would have elapsed between the two periods.

An extensive area of bog near Chatsworth in the county of Lancaster has lately attracted public attention from the circumstance of the Liverpool and Manchester Railway having been carried through it. The length of Chatsworth is about six miles, its greatest breadth about three miles, and its area, which is its entire surface, is the whole of which is pure vegetable matter throughout, without the slightest mixture of sand, gravel, or other material. On the surface it is light and fibrous, but it becomes more dense below. At a considerable depth it is found to be uniformly porous and marshy, but in its respects resembles coal: it is in fact exactly similar to the composition of the bogs of Ireland, as already described.

The moss is bounded on all sides by ridges of rolled stones mixed with clay, which prevent the immediate discharge of its waters. It is probable that this bar, by interrupting the course of the waters, originally caused the growth of Chatsworth. This moss presents at its edges nearly an upright face; the spongy surface of the moss being elevated at a very short distance from the edge from ten to twenty feet, and its thickness varying from a few inches to a foot. The immediate substratum to the bog is a bed of silicious sand, which varies from one to five feet in thickness, below which is a bed of bluish and sometimes reddish clay marl of excellent quality. This marl varies in thickness very considerably; in some parts it is not more than three feet thick, in others its depth has not been ascertained; below the marl is a bed of sandstone gravel of unknown thickness. This is a bed of gravel which extends beyond the edge of the bog, and prevents the direct discharge of the waters from the bog, and, instead, produces flat bogs. The general depth of Chatsworth varies from fifteen to thirty feet. (See also Camden's remarks or this moss, vol. ii. p. 566, Gibson's edition.)

About 1797 the late Mr. Roscoe of Liverpool began to improve Trafford moss, a tract of 300 acres, lying two miles east of Chatsworth, which operation was so successful as to encourage him to proceed with the improvement of Chatsworth, the most extensive lowland bog in England, including 7000 acres. After first constructing sufficient drains, the beauties of the country and the advantages of the place were apparent; a thin sod was then ploughed with a very sharp horse-plough, burned in small heaps, and the ashes spread around. Being then tolerably dry, and the surface level, the moss was ploughed six inches deep and the ground cultivated. The next crop of grass, not quite a yard to the acre, was set upon it. When this began to crumble and fall by the action of the sun or frost, it was spread over the land with great exactness, and the first crop was put in as speedily as possible, with the addition of about twenty tons of manure to the acre. This first...
crop, which must be put in with the plough, or with the horse-scuffle or scarer, may be either a green crop, as potatoes, turnips, &c., or any kind of grain. After making a great variety of experiments, Mr. Roscoe gave it as his conclu-
sed opinion, that the best method of improving moss-
land is that just stated, of the application of a caulescent substance, in sufficient quantity to convert the moss into a soil, and the raising of crops of minimal cultivation, such as the course of cultivation and the nature of the crops may be found to require. The cost of mowing was stated by Mr. Roscoe at 104. per acre, at which price rate it would not have been possible to have performed the work but for the assistance of a large number of men, and this quantity was as much as, without the employment of the men, the mowing could have conveyed over the moss by a cart with a driver and two horses.

In June, 1833, an ancient wooden house was discovered in Drumkelin Bog, in the parish of Inverconn, near the north coast of the county of Donegal in Ireland, by James Kilpatrick, while he was searching for bog timber. The description of the house and the other circumstances con-
ected with it were given by Captain Mudge, who was then engaged in surveying the coast, to the Hydrographer of the Admiralty, and by him communicated to the Society of Antiquaries of London, on his being invited to examine it. The house was four feet below the present surface of the bog; but it is estimated, by comparing the present surface with that of adjacent parts from which no peat has been taken, that the top of the roof must have been about sixteen feet below the present surface. The material of which the house was built is a yellow clay, and the work of the house was very firmly put together, without any iron; the roof was flat and made of thick oak planks. The house was twelve feet square and nine high: it consisted of two floors one above the other, each about four feet high, with a door on each side of the house. The whole stood on a thick layer of sand spread on the bog, which continues to the depth of fifteen feet below the founda-
tion of the house. Captain Mudge supposes that a stone chisel, which was found on the floor of the house, had been used to construct it; and the Black Smith of the timbers, as the chisel corresponded exactly to the cuts and holes. When the house was removed from the bog, and a drain had been opened to carry off the water which flowed into the hollow, a paved pathway was traced for several yards, at the end of which was discovered a hearthstone made of flat freestone slabs. The hearthstone was covered with ashes, and near it were several bushels of half-burnt char-
col, with nut-shells, some broken and others charred, be-
sides some blocks of wood partly burned. On the same layer, and in the houses of the native Mexicans, the ashes were found standing, just such as had supplied the timber of the house; and beneath all this, as already observed, there are still fifteen feet of peat. It is the opinion of Cap-
tain Mudge that this house must have been suddenly over-
whelmed by boggy matter, a conclusion which appears necessary to explain all the circumstances.

Bogs not unfrequently burst out and suddenly cover large tracts. This phenomenon happened in the present year (1835) in Ireland on a part of Lord O'Neill's estate, on the Bally-
nagow Brook, near Ballysusky, in the county of Down. On the 19th September an individual near the ground was surprised by hearing a rumbling noise as if under the earth, and im-
mediately after a portion of the bog moved forward a few perches, when it exhibited a broken, rugged appearance, with a soft peaty substance boiling up through the chinks. It remained in this state until the 22nd, when it again moved suddenly forward, covering corn-fields, potato-
fields, turf-stacks, hay-yacks, &c. The noise made by its burst was so loud as to alarm the inhabitants adjoining, who made inquiries by boat, and who were directed to proceed. It directed its course towards the river Maine which lay below it; and so great was its force, that the moving mass was carried a considerable way across the river. Owing to the heavy rain which had fallen for some time previously, the turf was not carried off, but arrived at the bank of the river in its bed, and considerable damage was thus obviated, which would otherwise have occurred from the forcing back of the waters. It is stated that upwards of 150 acres of arable land have been covered by this outbreaking of the bog.

BOG-EARTH, is an earth or soil composed of light sil-
ceous sand and a considerable portion of vegetable fibre in a half decomposed state, such as is often found accumulated over an impenetrable substratum, where the water has de-
posited the mud carried off from boggy places. It is in high repute with gardeners, being excellent for flowers, especially for some American plants, which thrive best in such a soil. A good fertile kind consists of nearly 25 per cent. of vegetable matter. When the water has been allowed to subside, and if necessary with some quicklime, to promote the further decomposition of the fibres, it is far superior to any artificial manure. Where it is not to be obtained in a na-
satural state, it is easily imitated artificially, by mixing the mud of ponds, with which wet places near the marshy water, leaves, wees, and grass, keeping the mixture well watered and frequently turned. It must then be exposed to the air for a considerable time in heaps, until the requisite texture is produced. Some sharp sand is an essential ingredient, and must be added if clay is found in the soil.

BOG or BUG [VISTULA].

BOG (the Hýpanis of the Greek and Roman writers), a considerable tributary of the Dniester, rises to the south of Proskuroff, south-east of Tarnopol in Podolia, in the elevated plateau which extends from the river Dnieper to Kief, and receives the waters of the Ingal, Balta, Teshterr, and Salonicha before it quits the territory of Podolia. Thence it flows in a south-easterly direction towards Nikolaieff, and into the Dnieper, 46 miles from it. It descends by a succession of falls in the vicinity of Sedyni, and flows in a rough current which lies between its left bank and the right bank of the Dnieper, where it winds its way through a liman, formed by its own inundations, nearly fifty miles in length, and which is crossed in many places by Oxossaff. It is between 470 and 480 miles in length, and in the lower part of its course attains a breadth of 500 feet; but its bed is so much obstructed by rocks and sandbanks, that it is only navigable when its waters are much swollen. The Senintha falls near the town of Olivopol, in the independent province of Chernos, and the Yekul at Nikolaieff, or Sedyni, which are included in the same province. By the treaty between Russia and Turkey in the year 1774, the Bog became the line of frontier between the two countries, from the mouth of the Seninka to the Dnieper, where it is crossed by the Mus-
covite upon the Ottoman in more recent times. We now brought the whole course of the Bog within the Russian terri-
itory. Its current is extremely gentle, and its waters, in its lower course, are of a saline taste. (Herod. iv. 52.) The principal towns situated on the banks are Bran ibulobopol, Olivopol, Vesenesen, and Nikolaieff. [DNIESTER.]

BOGDANOVITCH, HIPPOLYTUS THEODORO-
vitch, was born December 3rd, 1743, in the town of Pe-
revolotchina in Little Russia, where his father practised as a physician. On his death the family had to be educated in the College of Justice, where he soon began to display a passionate fondness for poetry and the drama. So greatly was he for a time captivated by the latter, that at the age of fifteen he determined to make the stage his profession, and for that purpose presented himself to Kheraskov, the author of the Rossia, and at that time the director of the Moscow theatre. Regarding this application as a boisth freak, Kheraskov represented to him the impropriety of the step he was anxious to take, but at the same time by the most methodical manner and intelligence, that he exhorted him to pursue his studies, and professed his assistance and instruction in literary com-
position. Bogdanovitch had the good sense to adopt this friendly counsel, and thenceforth began to apply himself diligently to the acquirement of a language and science, which he considered a perpetual or the best authors. His own industry was rewarded by the judicious advice and good taste of Kheraskov, whom he had now taken up on his abode; and he began to try his pen in some pieces which were published in the Uni-
versity Journal entitled Potezco Uesceles (Profitable Re-
creation).

In 1761 he was appointed inspector at the university of Moscow, and also translator in the foreign office; but in less than two years he went with Count Bielesko as the permanent legation to Dresden, where he remained so long that city he wrote, at least commenced, his delightful poem entitled 'Dushenka,' for it was not published till long afterwards—1785. It is upon these three cantos that his reputation rests, and they earned him the presentation and the Empress Catherine von their first appearance. The Empress Catherine
was charmed with a production, so unlike any thing that had preceded it in the language; and it almost immediately put him in the highest estimation with all the public. It was the idol of the court and the public: this rather than intoxicating popularity did not inspire him with increased confidence in his own powers, but seems rather to have chilled his invention; for although he afterwards wrote much more, the public showed themselves anything but enthusiastic over the productions that were calculated to win a second wreath for the author of ‘Dukenka.’ Even that poem itself is more distinguished by the felicity of execution than by the originality of subject or materials, its fable being the mythological figure of Psyche, which has been variously illustrated by different writers from the time of Apuleius to the present day, but by none perhaps it has been versified more elegantly than by Bogdanovitch. He bestowed upon the narrative all the captivating graces of style in a language which although it could not boast of elegance, yet, as has been justly observed, when the poet has arrived at the full extent of his genius, it will allow that there are many positive beauties in it, as well as striking comparative excellence. Some idea of its peculiar attraction may best be conveyed by saying that it is in the Russian language the poet’s most sonorous and entrancing, and its characters are a flowing sweetness of poetic diction, and a captivating ease and felicity of expression. There is also something of the same mingled gaiety and tenderness, of the same liveliness of fancy which pervades the poems of the English or Anglo-Irish bard. Had Anacreon written the legend of Psyche, he would probably have taken the same view of it that Bogdanovitch has done, who has thrown over the whole a gay and lively colouring, but is deficient in the paths requisite to give full life to the incidents.

Notwithstanding his early predilection for the stage, Bogdanovitch wrote only two dramatic pieces, one of them a comedy in verse entitled ‘The Joy of Dukenka.’ Except many short poetical productions and other contributions to various journals, he had the greater part of his remaining publications consist of translations.

In 1795 he retired from St. Petersburg with the salary of president of the archives continued to him as a pension, and passed his latter years in the peaceful solitude of Little Bolgorod, a small town in the 8th degree of Pomes, was born A.D. 1756, in the village of Oplew at Friesland, and studied divinity at Heidelberg and Geneva, then the two principal seats of reformed theology. At Geneva he became imbued with the intolerant principles of the then octogenarian Beza. When Bogdanovitch became minister at Sneek, he showed his own intolerance by endeavouring to compel the Mennonites there to a recantation. In 1604 he was made minister at Leeuwarden. In the polemics of his age he joined Gomarus against Arminius. He stood to the extreme of the Remonstrants, and was engaged on the capital punishment of heretics. He also wrote a ‘Mirror of the Jesuits,’ in Dutch, Leew, 1608, 4to.; a polemical work against Grotius, about or before 1614; and other pamphlets, but without the same success. In 1632 he suffered the deprivation of a preacher who held Remonstrant opinions, and greatly contributed to the victory of the Gomarists, or Contra-Remonstrants, over the Remonstrants, or Arminians. He was not without learning, but obtained celebrity, especially by his zeal against the Remonstrants.

Count William Lewis of Nassau, an enemy to the Remonstrants, recommended Bogdanovitch to the stadholder Maurice, who, for political reasons, opposed the Remonstrants. Bogdanovitch is said to have published an essay in which he endeavoured to prove that hatred was not the capital punishment, but we suppose this to be the above-mentioned translation of Beza’s tract, to which Bogdanovitch and Geldorp wrote a preface. Bogdanovitch the president, and four other members of the synod of Dort, were commissioned to translate the apostolic letter to the Philippians, which, as money was in the Synod, is chiefly Bogdanovitch’s work. It is still used in the churches of Holland, and is admired for its correctness, oriental taste, and purity of language. It is said that Bogdanovitch declined some lucrative invitations to the Hague and to Paris, and that his refusal was rather resented than accepted. It was in 1631 that the English translation of the Bible was authorized by Act of Parliament. Bogdanovitch was engaged in the translation of the Hebrew and Greek portions of the New Testament, and from his powers he exhibited a high degree of skill and ability, though he never produced anything that was calculated to win a second wreath for the author of ‘Dukenka.’

When Bogdanovitch returned home he was sharply reproved by the states and the synod of Friesland, to which province he belonged. He was also accused of having exposed his superiors to imputation, and it is said that he was even driven from his residence by his political enemies. Bogdanovitch died in 1633, as professor primarius at Franeker.

BOGLILORE (Hagelpur), a district in the province of Bahar, formerly known as the circar of Mogul, was under the government of a Mirza, receiving the title of Rajamahal, which forms a part of the Mogul province of Bengal. Boglilore is bounded on the north by Tirhout and Purneah, on the east by Purneah and Moorshedabad, on the south by Birbhum and Ramghur, and on the west by the Dacca district of Bengal. It lies between 24° and 25° N. lat. and 86° and 87° E. long., and occupies the south-eastern corner of the province of Bahar. Its greatest length in the N.W. direction is about 133 miles, and its greatest breadth is about 80 miles: its total area is about 8200 English square miles, as laid down by Major Rennell; but the boundaries, as is very common in Hindustan, are not very accurately defined, except in partial cases, where the courts of justice have been called upon to determine the disputes of rival zamindars.

A consideration part of the surface of the land is occupied by rock, and is altogether incapable of cultivation. In other parts the ground is studded at intervals with fragments of rock of various sizes. On the western hills similar masses of rock occur so frequently, that, when the declivities of the slopes are covered with verdure, the rocks render such a mode of cultivation impracticable. It has been estimated that the level ground in this condition
is upwards of 1700 square miles, and that the hills which are uncultivable are to the extent of 1150 square miles. The remaining portions, which are fit for the plough, consist of rich and productive soil. In the north-eastern part of the district, on the level lands overflowed by the Ganges, opposite to the district of Burdwan, lie the washermen of the vicinity collect carbonate of soda, which they call *muri cae mafii.* The saline matter effloresces on the surface in the month of October after the retirement of the waters of the Ganges, and may be collected several times from the same spot. It is remarked that no particle of this substance is formed after rains, but only follows the inundations of the river, and also that on digging to a small depth pure water unimpregnated with the carbonate of soda is obtained.

The Ganges flows to the eastward through the district of Bogipore from Monghir (where it forms the boundary between this district and Tibrhoot) to the north-eastern corner of the Rajmahal territory. The district is besides watered by many small streams which fall into the Ganges on its way. The largest of these streamlets are the Mura, the Ulayi, the Nogini, the Akguna, the Nacti, the Bagdhar, the Ghorghat, the Mohane, the Bahuya, the Bilasi, the Dobee, and the Modetriharna. None of these streams are navigable except during the flooding of the river, when some of them are used by small boats and for floating down timber and bamboo. In the dry season, unless near their sources, the channels of most of these rivers are dry. There are besides many pools or stagnant pools, apparently the old channels of rivers which have long been abandoned, and in many of which fresh water is found throughout the year. One of them, called Domjala, situated to the south of Rajmahal, is in the rainy season seven and a half miles long and three and a half miles broad, and even in the dry season is four miles long by two and a half miles broad.

From June to the following February the wind blows almost constantly from the east; during the other four months of the year the west wind prevails. These westerly winds bring in the summer, and dry and parching. The winters are colder than in the adjoining districts of Purunnah, and the summer season is frequently oppressively hot.

Besides Bogipore, the capital, the district contains the towns of Nadigar, Chapra, Colgong, Monghir, Bogwangoa, and Oudanolla. The population consists of rather more than two millions, of whom 450,000 are Mohammedans, and the remainder Hindus. The inhabitants are very unequally distributed, some purnagnas having more than 100,000 souls while others extremely dry and deserted. Of the mountainous people residing to the south and west of Rajmahal, this district is described as an uncivilised race, differing in manners, customs, and religion from the inhabitants to the north of them, who live under the protection of the native governments, subsisting by plunder, often desolating the neighbouring districts by their incursions, and only kept in order by means of certain pecuniary allowances made to their chiefs on the condition of their preserving the peace of the country. In the year 1782 the privilege was granted to the Mahrattas, and called Manjies, were to sit as assessors, and to declare their opinion, according to the laws and customs of the hills, which was to be subject to the confirmation of the judge of circuit before whom the trial was had. The Manjies were to be summoned to the number of not less than twelve whenever a prisoner was brought before them. The chief of the district was the reason for which the chiefs acting as assessors were to be selected by ballot from among those summoned. The three first selected might be challenged peremptorily, and any others for reasons assigned by the prisoner.

Unqualified slavery exists throughout the district, and the owner may sell his slaves in any way he chooses. In general these people are well used, and they are said to be industrious.

Great numbers of pilgrims, soldiers, and European travellers are daily passing through the district both by land and by water, and this forms a principal source of profit to the inhabitants, who furnish travellers with provisions and other necessary articles of consumption. It is estimated that at certain seasons as many as 100 passage-boats stop on the Ganges within the Rajmahal alone.

Rice, wheat, barley, and maize form the principal articles of agricultural produce, their relative importance being in the order in which they are here named. Potatoes are cultivated in the smaller towns of Monghir and Bogipore. Cotton is grown, but is not sufficient for supply for the looms in the district. Small quantities of silk and saltpetre are produced, and about 7000 mounds of indigo are exported annually on an average.

Black bears are found in the woods, but rarely occasion any harm. The vulture is another species of these animals, called by the natives hard-bears, which subsist on frogs and white ants, with other reptiles and insects. A species of baboon, the Hunimaia, exists in considerable numbers, and commits great depredations with impunity, being held so sacred by the inhabitants, that to kill one is considered as a crime, sure to be followed by ill luck. The Ratuya, a short-tailed monkey, is likewise common, but as he does not hold a sacred character in the eyes of the natives, he is not suffered to come near the towns. The commonest bird in the woods is the Parakeet. The tiger is not uncommon, and is frequently killed in the vicinity of the villages by the inhabitants, but as it is considered a sacred animal, no harm is inflicted on it.

(Anonymous. Indian Reaversions; Rennell's Memoir of a Map of Hindustan; Regulations of the East India Company, as contained in the Appendix to the Judicial Division of the Report of the Committee of the House of Commons on the Indian Affairs of the East India Company, 1832.)

BOGIPORE, the capital of the district last described, is a town of modern erection, beautifully situated on the right bank of the Ganges, in 25° 13' N. lat. and 86° 58' E. long. The town consists of about 5000 dwellings, and contains about 30,000 inhabitants. The other towns in the district are Mohammedans. A small number of persons, about fifty, who profess the Christian religion according to the ritual of the Church of Rome, have a church in Bogipore. These people are partly the descendants of Portuguese soldiers, and partly Roman Catholics, and are under the spiritual charge of a Romish priest, a native of Milan, sent by the society De Propagation De Fide, who likewise numbers among his flock a small society of Roman Catholics in the adjoining district of Purunnah.

A Mohammedan college exists in the town, but is now in a state of decay. A school was established here in 1823, under the patronage of the supreme government in Calcutta, and is supported by the public money. The object of this school, when first established, was the instruction of young children from the villages, and the extension of the institution, the success of this school was doubtful, and at one time it was proposed to discontinue it; other counsels prevailed however, and the plan adopted was enlarged in 1826, so as to admit the children of persons not attached to the army. In 1830 the school contained 134 pupils, the greater part of whom were children of chiefs from the hills; and as these scholars are quite free from the prejudices of caste, and apply themselves readily to learn the English language as a qualification for their appointment to the native courts, there is every hope that the institution may prove instrumental towards the civilization of the people to whom these scholars belong.

The few houses in the town which are inhabited by Europeans are handsomely built, and the Mohammedan mosques and also other public buildings, but with these exceptions the dwellings are of a mean character, and are generally scattered about without order.

About a mile north-west from the town there are two
round towers, supposed to be of Jain origin, which are considered sufficiently holy to be the objects of pilgrimages. [See JAIN.] Many natives visit them from a considerable distance, and for their accommodation a building has been erected near the spot by the rajah of Jeypoor, who numbers many students of the Jain sect among his subjects who visit them.

Bogotap is 110 miles north-west from Medellin. (Report of Committee of the House of Commons in 1835 on the Affairs of the East India Company, Public Section, Appendix.)

BOGOTA', or, as it was called till lately, Santa Fé de Bogotá, was the capital of the Spanish vice-royalty of New Granada up to 1811, then to 1819 of the republic of Cali, and afterwards of the republic of Colombia, and since its dissolution in 1831, the metropolis of the new republic. It is the seat of a archbishop and of a bishop, and is about 74° 10' W. long. Bogotá was founded by Quesada in 1538.

This town is situated at the foot of two lofty and rocky mountains, Montserrat and Guadalupe, which belong to the range which forms the western coast of South America, and are the affluents of the Rio de la Magdalena from those of the Orinoco; these mountains completely shelter the town from easterly winds, and supply it with water. Bogotá is slightly elevated above an extensive plain which lies to the west of it, and which measures about 48,000 square miles from south to north, and nearly as much in the other direction. This plain, which is surrounded by mountains which rise to a considerable height, is nearly 8640 feet above the sea.

The soil is very rich, but by far the greatest portion of it is devoted to the cultivation of tobacco, indigo, and other marigolds, or swamps; only that part which immediately joins the town is partly cultivated and partly formed into Potreros, or places for grazing cattle. The river Bogotá, or Funa, from which the town has received its name, winds through the northern end of the plain, at the distance of nine or ten miles from the town.

The climate of this plain is very temperate, the thermometer seldom rising above 60° or 65° in summer, and falling in winter to 40° or 45°. At the town it is only 2° from the equator, the mildness of the climate must be ascribed to its high elevation above the level of the sea, and in some degree also to the heavy rains. There are two rainy seasons, one during the months of April and May, and the other between September and the end of December. During these months the rain is nearly continual.

In June, July, and August the weather is unsettled and showery, and only from the beginning of January to the end of March it is rather dry. Plains with small elevations or islands on the sea are generally a very dry climate, and rather suffer from want of rain; the difference observed in the plain of Bogotá is to be attributed to its comparatively small extent, and the great elevation of the mountain-ranges which surround it. Bogotá is therefore not unhealthy. Epidemic diseases are unknown, and Europeans commonly enjoy good health, after having had on their arrival a fever for a few days.

Like many other towns built by the Spaniards in America, Bogotá presents the figure of a cross, of which the principal square and church form the centre. The streets are narrow, intersect one another at right angles, and are tolerably regular. All of them are paved, and the principal have footpaths, where the passengers are sheltered from the sun by projecting canopies. A steady stream of water is constantly flowing through the middle of the streets. The principal street, Calle Real, is well paved, and built with the greatest regularity. At the extremity of it is the principal square, where on Friday market is held. One side of the square is occupied by the palace, the other side by the custom-house, the cathedral, and its offices. The other squares also are spacious, and all of them are ornamented with fountains. At night the streets are imperfectly lighted by a few lamps placed at the corners of them.

The market-place is well supplied with every kind of provisions, especially fruits and vegetables, and those of Europe are mingled with others peculiar to America. At one place are seen hampers full of strawberries, apples, and peaches, and at another pine-apples and quinces; at another, heaps of cabbages, carrots, and potatoes, by the side of yuccas and bananas; between sacks of maize, barley, and wheat, are piles of cocoa and loaf sugar. In one place are sold various medicinal herbs gathered by the Indians in the mountains, and not far from them pinks, roses, and jessamine.

As Bogotá is subject to frequent earthquakes, most of the houses consist of one or two stories only; they are built of baked bricks; the greater part are covered with tiles, and the exterior of them is painted a greyish colour. The Spaniards adopted the mode of building houses which they inherited from the Arabs of North Africa into all the large towns of America, and consequently the houses in these places more resemble those of Morocco and Algiers than those of England or France. The front wall presents only three windows of different dimensions, without glass sashes, and defended by large iron or wooden bars. Two gates and an intervening passage lead to a spacious court-yard, which is surrounded by a projection of the roof and a gallery when the house is of two stories, and by a guard-house if it is of two stories. Round this gallery is a long suite of rooms, which receive daylight only through the doors. The kitchen, which commonly occupies a corner of the court-yard, is spacious, less on account of the quantity of provisions cooked than the number of useless servants who assemble there. There are no chimneys, stoves only being in use.

The furniture is simple. The use of carpets is general; the ancient straw mats of the Indians however are no longer used by fashionable people, and have been superseded by carpets of European manufacture. There is nothing in the drawing-rooms but two sofas covered with cotton, two small tables, a few leather chairs, after the fashion of the sixteenth century, a looking-glass, and three lamps suspended from the ceiling. The bedsteads are somewhat ornamented, but not finished furniture, and are never used: wooden mattresses are substituted for them.

The cathedral of Bogotá, which was a noble building, was ruined by an earthquake in 1837. It contained an image of the Virgin, which was covered with diamonds and other precious jewels, and was the principal church of Bogotá at the end of twenty-six, are in their interior resplendent with gold. A great number of churches are dependent upon convents, the revenues of which are very considerable. There are nine monasteries and three nunneries: those of the Dominicans and of the Sisters of St. Francis are in San Juan, and were not endowed; half of the houses in Bogotá belong to them. These monasteries are more remarkable for solidity than beauty, and are arranged nearly in the same manner as the private houses.

The palace, which once was the residence of the Spanish viceroys, and at present is inhabited by the president of the republic, is a flat-roofed house; two adjoining ones, much lower, ornamented with galleries, constitute its dependencies. The palace of the deputies is nothing but a large house at the corner of a street, which is let to be used for shops. The senate assembles in a wing of the convent of the Dominicans, which has been fitted up for the purpose.

There are three colleges in Bogotá, all well situated and well built. The principal one, that of the Jesuits, possesses the character of solidity peculiar to buildings erected by that famous order. The majority of the professors are monks or priests. The course of instruction in these establishments consists of the Latin language, philosophy, the mathematics, and theology.

An hospital is dependent on the convent of San Juan de Dios, but it is far from being well managed. The other public buildings in Bogotá are the Mint and a theatre.

The majority of the inhabitants are Creoles. The half-blood Indians and other foreigners are numerous, being alone employed as servants. Mulattoes are much rarer than in the rest of Colombia; the whole number of inhabitants is estimated at 30,000 or 40,000. The inhabitants of Bogotá are mild, polite, and cheerful.

The site of the public walk, which forms one of the principal entrances of the town, is a fine piece of ground, intersected by fragrant hedges of rose-bushes and a variety of wild flowers of luxuriant growth. It is crossed on Sundays and festivals for all classes of society. The other walks consist of open grassy plots and bull-fights, and occasionally the theatre; but more frequently the chance of chance are resorted to, at which bets run as high as 10,000 pistares. The pomp displayed in the religious processions, and the great number of saints' days, greatly contribute to the amusement of the populace.

Bogotá owes its importance solely to the circumstance of its having been so long the seat of government, for which it is well adapted, owing to the ready communication with the
country to the north and east. In three days the town of
Hondorf on the banks of the Rio de Magdalena is reached,
from whence the post generally arrives at the coast in
seven days, owing to the great velocity of the current, which
however delays its return after the rainy season, some-
time twenty days. In six months the convenience of the
establishment of a steam-boat has been projected.
Again, the river Meta runs to the east of the mountains
which stand at the back of the town. This stream falls into
the Orinoco, and thus gives facilities for sending information
down the river. (Humboldt; Mollien's Letters from Co-
lombia.)

BOGWANGOLA (BHAGAVAN GOLA), a consi-
derable town in the district of Bogipire, on the right bank
of the Ganges 24° 21' N. lat., and 88° 29' E. long.; about
cast of the N. E. point of the mouth of the river,
considerable trade, and forms an important grain market,
from which the inhabitants of the town of Bogipire are princi-

BOHEMIA (in German, Böhmen), also termed Böheim
in many ancient records, derives its name from the Boi,
who once occupied the parts about the sources of the
Elbe and Moldau. It now constitutes a kingdom, with
the island Bohemia Proper, the margraviate of Moravia, and that small portion
of the duchy of Upper Silesia, which was not ceded to Prussia
under the treaty of Hubertusburg in 1763. The margraviates of Upper and Lower Austria, Moravia, and Bohemia Proper, until the treaty of Prague in 1635 transferred them to the electorate of Saxony. The details which we
are about to give will be confined to the territory generally
known by the designation of Bohemia; which is an irre-
gular quadrilateral in the S. E. of Germany, extending north
between 48° 52' and 51° 2' N. lat., and 12° and 1° 66' E. long.; it contains a superficies of about 30,000 square
miles, or 12,606,400 acres, which is more than two-thirds of
the area of Ireland or Bavaria. It is bounded on the north
west by the kingdom of Saxony, on the north-east by the
Prussian province of Saxony, and by Austrian and Prussian
Silesia, on the south-east by Moravia, on the south by the
Archduchy of Austria, and on the south-west by the

BOHEMIA is inclosed on every side by lofty and in parts
wild and dreary mountains. On the west side, and from a
point about one-third of the distance between the river and the
sea, one takes a N.E., and the other a S.E. direction. The
first of these ranges, which separates Bohemia from Saxony,
and may be termed the left arm of the Sudetean chain, is

Bohemian Forest mountains, which is wholly of primitive formation, and
characterised by naked and precipitous features and deep ravines.
Towards Bavaria its slope is extremely abrupt, but on the Bohemian side the descent is gradual, and the highest
points are the Heidelberge, whose summit forms a
spacious plateau, at an elevation of 4622 feet, the Kubani
or Boubin, 4496 feet high, the Rachel (which some however
place in the Bavarian territory), 4394 feet, and the Disch-
seeburg. Bohemia is also intersected by several ranges of inferior

The interior of Bohemia presents an undulating surface,
very frequently studded with high and pointed eminences,
but with a general slope towards the centre of the country. The most extensive plains are in the provinces of Königgratz and Chrudim, from Neustadt to the Nassyberg mountains. The country is full of valleys and mountain passes, among which we may mention the delightful valleys of the Elbe and Beroun; but the deepest is the Riesengrund or Gunt's Glen among the Giant Mountains. From Zippe's Survey it would appear that the whole of the mountains which arise in the valley of the Elbe form a range of mountains in the exception of two points, the one in the north where the Elbe quits Bohemia, and the other in the north-west, about Braunau and Trautenaun, which are of a later formation. A very extensive formation of sandstone is observed in the hills near the confluence of the Elbe and Teplicz. A remarkable mass, the Steinwald, near Aderbach, which is nearly five miles in length and above a mile in breadth. It stands at some points in compact masses, and in others is shaped into lofty columns, pyramids, cones, and, forming irregular, are surrounded by the coniferous forest. After the west of the coniferous forest there is a more particular mountain range, the Giant Mountains, which is remarkable in the neighbourhood of Josephstadt and Königgratz. It forms in many parts a rich alluvium by the overflowing of its banks, and quits Bohemia after a course of 150 miles at Herrenkretscham, near Schan dorf, where it enters the kingdom of Saxony. Its sources are 4260 feet above the level of the sea, while its bed, at the point where it leaves the Bohemian territory, is not more than about 287 feet above it. Its principal tributaries within the borders of Bohemia are the Moldau and Eger. The Moldau rises in the swamps of the Steck Morava, and the Bohemian Forest Mountains, close upon the confines of the Bavarian bailiwick of Wolfstein; it first flows S.E. and when it has reached Rosenberg at the southernmost extremity of the kingdom, takes a northerly direction through the valley of the Moldau, and falls into the Elbe near Melnik after a short bend to the east. The Moldau, termed the Vitawa by the natives, runs for about 286 miles before its junction with the Elbe: it generally runs between steep banks, and at its confluence with the Elbe is nearly as broad as the river; and its current is impeded by the woods of the Ledebur to Prague, its length is about 130 miles, and from Prague to Melnik about eighteen. Its breadth at Prague varies from 250 to 286 paces; its height of its surface, which is 1311 feet at Krumpau, declines at the bridge in Prague to about 229. In wintertime, called the Chief of the Bohemians, rises on the east side of the Fichtelberg in the Bavarian circle of the Upper Main, whence it soon after enters Bohemia and flows eastwards for about eighty miles until it joins the Elbe on the west bank near Theresienstadt. Tributaries of the Moldau, the Elbe, the Eger, and the Kolo, which rises near Königgratz and skirts the principal of Glatz in Prussian Silesia for a short distance, the Mettau, which flows from the vicinity of Josephstadt, and the Iser, which descends from the S. slope of the Giant Mountains, not far from Brandis, and the streams that join the Moldau are the Luschnitz, which flows from the neighbourhood of Moldautein, the Wottawa or Watawa, which flows from the Bohemian Forest Mountains, and for some distance first bears the name of the Widra, the Sazawa or Carpathian; the Moldau then flows near Harau, or Berauanka, which rises near Königssalz. The whole drainage of Bohemia finds an outlet through the narrow pass of the Elbe at Herrenkretscham. As this outlet, independent of its confined width, bears evident marks of violent dissection, it is not surprising that fresh water, walled in with mountains, it has been conjectured that the whole of Bohemia must at one time have formed an immense lake, which has been drained by a disruption taking place at the point where the Elbe ceases to be a boisterous stream. Among the numerous falls of water in Bohemia the most interesting are those of the Elbe, of the Moldau across the Devil's Wall, and those in the vicinity of Neuvald. Though full of small pieces of water, Bohemia has no lakes large enough to meet the wants of the people, particularly the Servina swamp (or Gezeera), between Břír and Postelberg, and the Slatina swamp near Doran on the Eger: a considerable portion of the first of these has lower drained and converted into pasturage land. The river Moldau is navigable in the rainy season only for vessels of 100 tons burthen; but it is of great importance to Bohemia in the production of its riches, and it is in great repute. A recent enumeration of such as are publicly known amounts to upwards of 160: at the head of the ferruginous springs are the Franzens brunnen, near Eger, the three springs at Marienbad, and that at Gies- sberg; and among the most celebrated is the Franzens brunn in the Giant Mountains, which is the only one of Corbel and Teplitz, one at Marienbad, and others at Bilin, Liebenwaid, and there are bitter waters at Sleditz, Saitzschitz, and Pula; sulphurous springs at Teplitz, Soberschitz, &c.; aluminous and vitriolic springs at Stecknitz, Mochenau, and there is a spring called the acid springs at Schlan and in other places. The virtues of the springs of Carl-bad, as well as the beauty of the adjacent scenery, have placed that spot at the head of the baths of Germany, and acquired for it the name of the Pearl of Bohemia; the yield 154,000 litres 222,500 gallons in an hour, of which the Springer alone yields 2473 gallons. The temperature of some of them at the moment of their first emission is not less than from 59° to 60° of Reaumur (about 140° to 142° of 22° Fahr.). From the original baths at 19° (59° Fahr.): the Franzens brunnen near Eger not more than 9° or 10° (34° Fahr.). The whole quantity of mineral water exported from the Bohemian springs in the year 1825 was 232,320 quarts. The interior of Bohemia and its remoteness from any coast, for it is nearly equidistant from the Baltic and Mediterranean, give it a clear and salubrious atmosphere and general constancy of weather. The climate naturally becomes keener and blinder as the chains of mountains which encircle Bohemia rise in height. The regions about Gottesaib (God's gift) in the Ore Mountains are considered the coldest in Bohemia, and there are few months of the year in which there is not need of fire; nor will grain ripen in them. In the Bohemian Forest range, the climate is more variable, and in winter the snow does not disappear until the middle of April, as well as in those parts of the province of Budweis which are saturated with moisture, there are many districts, in general covered with woods or forests, which are not habitable. From observation it appears that the mean temperature at Prague is 17° 17° of Reaumur (47° 47° Fahr.) whilst on the elevated site of Re- berg it is not more than 4° 4° of Reaumur (12° 12° Fahr.). In the neighbourhood of Reichenberg, where the harvest is two or three weeks later than in the low country, the highest degree of temperature has been known to be 43° and the lowest to the severest degree of cold —6° (18° Fahr.). The prevalent winds blow from west to some points north, and from west to some points south. The winds from these quarters, according to Diak's observations, invariably bring dry weather with their low pressure, but in summer, when the winds blow from the north, the mists and fogs, by their point of departure in summer, the finer the weather. In winter it is precisely the reverse, they being usually accompanied by rains and thaws. On the other hand, the nearer to the north their point of departure, the more frequent are the storms and the more violent are the storms by which they are attended.

The soil of Bohemia varies considerably in productiveness, but it is nowhere entirely sterile except in certain parts of the Bohemian Forest, on the Ore, and Giant Mountains, those lands alone along the line from the Moldau to Kunieritzerbege to Königgratz, which are coated with sand, and in some of the districts where swamps abound. The rest of the low land is in general rich and productive, particularly the province of Suazit. No soil in Bohemia is more fertile than that of the Moldau, especially along the site of large sheets of water, its deep black loam being highly favourable to the growth of wheat, rye, and barley. Bohemia produces almost every description of grain and pod seeds, but not much maize: the quantity of arable land is about 1,583,000 hectares, yielding an average yearly crop of wheat amounting to 2,586,000 Imperial bushels; of rye, 24,430,000; of barley, 11,020,000; and of oats, 32,035,000; among other productions are nuts, potatoes, vegetables, liqueur-root, chicory, excellent hops, &c. Flax is grown in every province, but of various
quality, and hemp is raised in some few quarters; rape- seed is also largely cultivated for the sake of the oil. Fruit abounds to an extraordinary extent; the standing crops are
obtained in one, excepting the vicinities of the Elbe and Molau, which yield annually about 392,000 gallons. The
border mountain ranges, from which however some of those which adjoin Moravia must be excluded, contain rich sup-
plies of waterfalls the water power of which is prodigious, renders those supplies no longer so abundant as in former
times. Mosse, particularly the Iceland sort, herbs, grasses, and
medicinal plants, many of them of rare occurrence else-
where, are plentiful in the mountain regions.

Bohemia is more mountainous than some of the larger
granite, and sandstone; precious stones, particularly the celebrated Bo-
heimian garnet or pyrope, rubies, sapphires, topazes, chry-
solites, amethysts, cornelians, chalcedonies, and agates;
limestone, beautiful marbles, porcelain earth, slates, potter's
clay, and a large variety of serpentine, basalt, porphyry, &c.
The mountain districts yield gold and silver, quicksilver, tin, lead, iron, bismuth, zinc, cobalt, arsenic,
manganese, nickel, chrome, &c. Of salts Bohemia furnishes
natural alum, natron, several kinds of vitriol, and almost
every variety of the uses of salt from mineral springs; and
as common salt is extracted from some of the springs, it
has been inferred that beds of rock-salt exist in some
quarters. Considerable strata of sulphurous slate, as well as
coals, have been found, and in some directions peat-turf
is obtained.

Bohemia has a very superior breed of horses. This
breed, though not of large size, has undoubtedly the advan-
tage over that of any immediately adjacent country from its
courage and spirit; from these three words only is derived
the sum of 140,000. The cattle of Bohemia, amounting to
about 244,000 oxen and 651,000 cows, is not adequate to
the home demand. The native race is in general small and
of inferior shape; and, on account of the insufficient sup-
ply of large imports are made from Poland and Moldau. The
sheep, of which there are about 1,500,000
beads, afford excellent wool. The stock of goats and swine
is abundant. Poultry, particularly turkeys and geese, are
reared everywhere; honey and wax are produced in all the
provinces, but the clover and pasture have Malta been
inhabitants where the population has increased, but no where in so
marked a manner as in the "Giant-mountains;" it cannot
however be termed scanty; and Bohemia still possesses stags,
deer, hares, wild hogs, pheasants, and partridges in abun-
dance. The valleys contain springs, such as springs, and
and lynxes, continue partially to infest certain districts, chiefly
those adjoining the "Bohemian-forest mountains."
The fox, marten, pole-cat, weasel, and squirrel also inhabit
the Bohemian woods. Birds of prey abound. Considerable
supply of birds is also obtained from the birds of prey; but, from the extensive, productive parts of this
country; amongst these is the salmon, which finds its way
from the North Sea into the Moldau and Wottowa. The
mountain-streams are full of trout; and eels and cat-fish are
plentiful in the lakes, and the peal of the church bells, from which the nourishment is extracted, which are also obtained
in the Wottowa and White Elster, near Steingriin, in the
district of Eger.

We have already given a statement of the present popu-
lation of Bohemia, which amounts to 3,908,275 souls. To
this amount about 30,000 military and persons connected
with the military establishment must be added; so that the
actual number of inhabitants is about 3,932,000, or about
195 to every square mile. There has been a progressive increase of the population which has been from the subsequent data. In
1785 they amounted to 2,716,084; in 1795, to 2,879,793; in
1805, to 3,263,379; in 1815, to 3,142,450; in 1825, to
3,329,192; and in 1831, to 3,888,828, of whom 1,548,530
were males, and 2,040,298 were females. In the sixteenth
years between 1815 and 1831, therefore, the increase was
746,378, or 46,648 per annum; in the six years between
1825 and 1831 it was 359,636, or 59,939 per annum; and
in the two years 1832 and 1833 it was 74,047, or 37,073
per annum, a diminution which is ascribed to the diminu-
tive effect of the state of war which prevailed during a part of the
year 1832. Of the present population about one
third lives in towns, and the remainder form the rural popu-
lation. The total number of houses in 1834 was 555,448,
which gives an average of 7-5 souls to each house. Bohemia, with the exception of the capital, contains no town of the second or third rank; none
of which the population is between 50,000 and 100,000
or between 15,000 and 50,000; and it has but twelve even
of 10,000 inhabitants. The number of ecclesiastics is 4107, or about 1 to every 950 souls, and of persons of noble blood, 2134, or about 1 to every 1829. We may here remark, that the population is comparatively greatest in those parts where the soil is by no means the most fertile, or where the land is most inhabited by the Slovaks and their brethren in Moravia, they are descendants of the Lechi or north-western branch of the
Slovakians, who were the first to cultivate and refine their
native language. The Czechs are passionately fond of
music and singing, and as they are confirmed in their intel-
ligence and strength of memory. Next to this race, the
Germans, who are about 900,000, are the most numerous;
they chiefly inhabit the districts bordering upon Prussia,
Bavaria, and Saxony, and spread themselves from the pro-
vincial districts of Prussia eastwards to the Danube, in
Mermer and Bidschow or Biczow, as far as that of König-
igratz. In mechanical and mercantile pursuits they are supe-
rior to the Slovakian inhabitants; and their language has
taken the leading place of the other dialects throughout the country. The Jews, who are not to be found 62,000 or over 72,000 (they did not exceed 3600 families), appear from the inscrip-
tions on several ancient tomb-stones to have been settled in
Bohemia as far back as the first century; their principal
occupation is trading and money transactions; most of the
brandy distilleries and many breweries are in their hands,
and they generally rent the government potash works. At
Prague there is a colony of Italians who settled there in
early times, and are exclusively employed in trading.

The premature death of the inhabitants is not so great
as in many other countries, and longevity is of frequent occurrence. The average proportion of the deaths to the whole popu-
lation is 3 in every hundred souls, which includes the mor-
tality of the capital: in the low country it does not exceed 1
in 39.

The Roman Catholic religion is professed by the ma-
Jority of the inhabitants. The secular clergy consists of the
metropolitan archbishop of Prague, the three bishops of
Prague, Riga, and Lignitz, and the seven suffragan bishops,
and twelve prelates; and the affairs of the Bohemian church are conducted by the metropolitan and the three above-
mentioned bishops. There are chapters and collegiate bodies composed of provosts, deans, and members of chap-
els (canons) and other clergy of the diocese of Prague,
and the other two provinces. The remaining members of the
establishment comprehends 7 provosts, 11 archdeaconies, 133 deaneries, 1197 benefi-
cies or cure of souls, 83 parochial administrations (tparr
administrationen), 340 ministries (locaten), and 82 presbyter-
ships (expostureit). Considerable limitations have been
imposed on the regular clergy, who still possess 75 mos-
staries and 6 convents, including an English sisterhood.
The Protestants are most numerous in the north-eastern
parts of Bohemia; but there are none in the south-western:
they are confined to the cities. They are chiefly Protestants in the city of Prague, and some Protestants are
found in the city of Bohemia, and in the city of Bristow. Others of his cast had long before him affirmed that Boh-
emia was nothing less than Judaea itself, the land of Sion and Bethlehem, Tabor and Emmaus, Horeb and Jerusalem; and even one of them even deemed a remnant of Adames subs-
ists even at the present day.

The houses of the Bohemians possess in general few
claims to elegance of structure, or even comfort in their arrangement; and there is scarcely a town which is not ill built and badly laid out. Places of any magnitude are usually constructed of stone, but here and there of slate; in the agricultural and mountainous districts, the houses are rapturously detached from the other material of the wood. The whole number of families in the year 1830 was 876,633.

The Bohemians may be described as being, with few exceptions, a peaceably inclined and religiously disposed race of men, devotedly attached to the government under which they live, and brave and resolute under the endurance of hardship; they are remarkable for hospitality and kindness towards the needy and afflicted. The moral condition of the people too is good, as may be inferred from the average of offences which were the subject of investigation or trial during the five years 1826-30; during this period, on an average, 2579 cases per annum, which did not exceed 1 every 1428 individuals. The number of illegitimate births amounted in 1829 to 16,509, of which 8442 were males and 8067 females; every eighth birth occurring under this description. The annual average number of births for the period of thirty years between 1786 and 1814 was 126,879; and for the fourteen subsequent years (1815 to 1828) it was 143,087. The average of deaths for the first-mentioned period was 106,399; and for the last-mentioned, 106,299. With respect to marriages, the number of those celebrated between 1785 and 1814 was 94,069; and between 1815 and 1828, 77,387.

The cultivation of the soil is susceptible of great improvement. The great mass of the peasantry are held in servitude, and have little interest in the products of their labour. The land is not owned by the cultivators; in fact, agriculture is in the hands of the nobility and a few free peasants, who are proprietors of the actual labourers on their estates, and exact heavy service from them. Owing to the inadequate supply of fodder for horses and cattle, that is an insufficiency of manure. The whole extent of available soil is estimated at about 11,106,090 acres (7,774,264 Vienna yochs); the remainder consists of rock, marshes, tracts of sand, roads, and paths. In some parts the produce of the land is tolerably abundant; for instance, in the province of Silesia, the vicinity of Prague and on the Bohemian prairies, to which extent is the greatest in all the northern provinces, with the exception of the districts about Eger, where the people appear to entertain an extraordinary aversion to it; its extension and improvement have been essentially promoted by the encouragement given to agriculture in Saxony and Silesia, is said to amount to about 300 tons annually. Among dyeing plants the chief is madder-root, which are raised in large quantities around Solmitz and Liboch. Bosnia is celebrated for its excellent kind of hops, of which the produce is considerable; those grown in the province of Saatz, and next to these, the hops cultivated in the provinces of Rakonitz, Bunzau, and Pilsen, are in highest esteem. The quantity exported appears to vary between 16,000 and 20,000 cwt. annually. A reason to believe, was much more extensively cultivated in former times, but at present; but the climate is undoubtedly unfavourable, and hence the surface devoted to its cultivation is not more than 6400 acres (4481 yochs), of which, as before observed, does not exceed 392,000 gallons. The Burgundy grape was transplanted to the neighbourhood of Mellick about the year 1348, and the wine derived from it in favourable seasons is accounted little inferior to the parent-juice. An ordinary kind of sparkling champagne, called "Cerneseker," is made near Ausig; but the other descriptions of wine produced near Prague, Bechlin, Kaudnitza, &c., are but of indifferent quality. The demand exceeds the supply of the other kinds of wood. The quantity of the precious metals has declined, the whole annual supply of these mines, which is estimated at 231,000, has not fallen off in value. The quantity of gold and silver, now principally got near Pribram, Jaschmuthal, Rule, and Suedling, in the years 1826-28, was considerably compared with what was obtained in the sixteenth century, when the mines yielded as much as 1,090,000 marks, or about 9,517,300 ounces of silver, up to the year 1589 alone. Between the years 1765 and 1717, however, the produce of this metal into the public mint was not altogether more than 264,708 marks, or about 2,988,000 ounces, and in 1827 the annual production had sunk to 1292 marks. Quicksilver has hitherto been found only in the form of cinnabar; the copper mines have ceased to be productive, and are abandoned; these of tin (and it may be here observed that Bohemia is the only part of the Austrian dominions where tin is found) have likewise been deserted, that between the years 1817 and 1828 their annual produce fell from 1844 cwt. to 679 cwt., and the working of the mining has been abandoned by the government to private individuals. The lead mines, principally situated about Pribram, Mise, and Bleiswalt, in the year 1825, were abandoned; these produce in 1825 consisted of 14,168 cwt. of lead containing silver, 15,023 cwt. of pure lead, and 10,904 cwt. of litharge; making in all 43,094 cwt. Lastly, the iron mines, the production of which lies in the province of Narentin, in the province of Beraun, in that of Pilsen, employ about eighty furnaces and 6000 hands; and have increased since the year 1825 from an annual produce of about 7800 tons to about 17,500; but the article is inferior to the German and Italian quality. Quantities of coal are produced in both parts of Bohemia; and there is a nearly a province which is not supplied. Marble is obtained at Steiner; sandstone in several places; the Przilpe, Breitenstein, and other quarries, yield excellent mill-stones; large quantities of basalt are used in building and paving at Parchen, Rosau, &c.; quotas of superior quality are got at Böhmisch-Aicha, Weisswasser, Giesbürgel, and elsewhere. Among the precious stones found in Bohemia, the celebrated garnet, which is equal to that of the East in brilliancy, and superior in lustre, is found in the county of Swetiuau in the province of Czasalau, and Dalschau, in the province of Loitmeritz. The produce of the coal-mines has greatly increased in the last years in consequence of the increasing price of wood, particularly in the northern provinces, where the quantity of wood consumed each year 1825-28 rose from 45,900 to nearly 80,000 tons. The southern parts of the province of Rakonitz, in particular, furnish a coal of very superior description. Graphite or black-lead is found in considerable layers near Krumau and Svjejann and is extensively worked; but is far inferior to the English. About 4900 cwt. of copper is annually obtained, and vitriol and sulphuric acid are prepared from the residua.

Bohemia is one of the most manufacturing provinces in the Austrian territory; and the northern provinces, especially those on the borders of Moravia, Trutnau, where the rawness of the climate, or an indifferent soil is unfavourable to agriculture, are the principal seats of manufacturing industry. The glass of Bohemia has been in repute for its cheapness, lightness, and durability ever since the thirteenth century; although its product has sensibly declined in modern times, it still employs nearly sixty works, and about 4000 hands, and keeps a capital of 800,000L. and upwards profitably engaged. The best manufacturers of this article are at Neuvard and Novisenda; and the finest articles are at Neuvard and Novisenda are highly polished and cut glass. The best mirrors and enamelled wares are produced at Neuhurkenthal and Bürstein. The cultivation and working up of flax constitutes a chief means of subsistence among the inhabitants of the highland districts. Many parts of the districts adjoining the northern and eastern ranges of mountains form one continued manu-
factory of linena, in which thousands of humble cabins per-
etually resound with the noise of the Jenny or loom; 300,000
hands at least (a considerable proportion at their leisure
hours only) are employed in the manufacture of
yards of plain and figured linena in that of linena 1100
individuals depend on the making of tapes and ribbons,
and full 20,000 on lace-making. The yearly value of
the several products which their united industry supplies is
estimated at 1,200,000fl. sterling. But this branch of
manufacture is on the decline, in consequence of the progress
in making in that of cottons. With regard to the last, much
twist of the inferior numbers is spun by machinery and at
near Neumarkendorf, Wernstedt, Rothenhaus, Joachim-
thal, and Schönlinde, &c, but the higher numbers are im-
ported from England and sold under the name of English
weaving of plain calicis, of which the annual value is esti-
mated at 300,000fl., is principally carried on in the provinces
of Leitmeritz, Bnitzlau, Elbogen, and Biczow; the finer
directions, to the extent of about 250,000fl. a year, are
manufactured in the same quarters, as well as earlagen
and cotton-printing, which has greatly advanced of late
years, is best done at Cosmanos, Reichstadt, Jung-Bnitzlau,
and Prague. The number of pieces made throughout
Bohemia is said to be upwards of 100,000, over and above
what is produced by machinery and the manufacture of
all kinds employ about 20,000 hand-spinners, and be-
tween 9000 and 10,000 weavers; these however are in-
dependent of about 18,000 individuals who are employed in
making hosiery, the yearly value of which is estimated at
150,000fl. And of these a very large number, particularly
that at Landakron in the province of Chrudim, are on an extensive scale; the quantity of cottons
bleached by all these establishments is computed to amount
to 40,000,000 pieces of twist, 200,000 shocks of linena, and
100,000,000 yards of muslins, sacs, and plain calis, at 160,000fl.
per annum. The potash manufactories employ
about 6000 hands, and the annual value of the article pro-
duced is about 200,000fl. Large quantities of worsted stuffs
and woolens of an inferior quality are made, and those
stocking-manufactures employ about 8000 hands, and are
manufactured to the extent of about 500,000fl. or 600,000fl.
yearly value, and 60,000 cwt. of the raw material; of these
nearly one-half are made in the province of Bnitzlau, in which
lies Reichenberg. From these we have our best and finest
woollen descriptions of Bohemian wools. It has been esti-
mated that the trade in wool and woolen manufactures affords
subsistence to 70,000 individuals and upwards; namely, about
35,000 spinners, 11,000 to 12,000 weavers of piece-goods, 3000
weavers of linen, and all kinds of stockers and
stocking-makers. Of silks the manufacture has hitherto
been inconsiderable, and it is almost wholly confined to
Prague. Leather and manufactures from it give employment
to about 4000 hands, and the value of the articles pro-
duced may be estimated at about 400,000fl. a year.
The manufacture of china has been brought to
much perfection at Slagggenwald, Elbogen, Pikenstein,
and in other places; and that of earthenware is carried on
in several parts of the country. Iron wire is made to the
extent of 100,000 tons at nearly 2,000,000fl. sterling a year.
and it has two lines of iron railways, the first
constructed in Austria on a large scale; the one running between
Budweis and Linz, and the other, which is ninety miles in
length, between Pilzen and Prague. Much benefit has ac-
curred to the country from the establishment of a permanent
exhibition of native productions and manufactures, as well as
the recent foundation of a society at Prague for the pro-
motion of national industry.

The intellectual wants of the people do not, on the whole,
appear to have been neglected. The national schools con-
sist of a normal seminary for educating teachers, 49 head
schools, and 2556 common schools, of which 2500 are Roman
Catholic, 36 Protestant, and 20 Jewish. For the higher
branches of education Bohemia possesses a university at
Prague, 26 public schools, three philosophical, and three theological seminaries, a polytechnic institution,
an academy of painting, a conservatory of music, several
military schools, and other establishments. In Prague there
is an academy of the arts and sciences, the only institution
of the kind in the hereditary dominions of the house of
Austria, and an economic patriotic society, which has done
much for the encouragement and improvement of agri-
culture.

The civil administration of the country is vested in a cen-
tral government, subordinate to the higher authorities in
Vienna; its seat is Prague, and its president is styled the
superior burgrave. Judicial affairs fall under the superior
cognizance and control of a court of appeal and bench of
criminal justice in the same capital.

BOHEMIA.**

* * *

Bohemia, Forest of, called in German Böhmer-
wald, and by the aborigines of Bohemia or Czechs,
Bohemia, or Bohemian, is the most forested
part of the empire on both sides of the Danube, and
separates in the greatest part of its course Bohemia from
Bavaria. Its direction is nearly N.W. and S.E.

It commences at its north-western extremity near the
place where the Rhine parallels it, by the meridian of
12° 20', to the south of the town of Eggenburg, by
which it is divided from the neighbouring Fichtelgebirge
is upwards of 1500 feet above the level of the sea. In this
depression rise two torrents, the Wondra, which running
towards the south-east for about 40 miles, then flowing
south-west empties itself into the Naab. The
range terminates at its south-eastern extremity with the
hills which advance close to the banks of the Danube oppo-
site the town of Linz in Upper Austria, where the surface
of the Danube is still about 830 feet above the same
line.

This mountain-ridge is very distinctly marked on its
south-western declivity, where it descends very abruptly
towards the table-land of Southern Germany, which is at
a mean upwards of 1000 feet above the sea; towards its
northerly extremity it is less abrupt. In the vicinity of
Linz, it slopes down by a continuation of hills. The north-
theastern declivity towards the course of the Moldau and
Elbe rivers is not abrupt; and here several lateral ridges
detach themselves, and gradually sink as they approach
the banks of the Moldau and Elbe.

The principal ridge, which extends about 112 miles, does
not rise to a great height. The northern half presents on
its summit extensive flats, overtopped here and there by
some hills, which never attain an absolute altitude of more
than 2500 feet above the sea. The southern extremity is
640 feet above the same line; and some summits attain the elevation of the highest mountains in Scotland. Mount Heidelberg is the
highest, and rises to 4622 feet; Mount Kubani to 4496;
Mount Arber to 4582, Mount Rachel 4394, and Dreises-
berberg to 4044 feet. The last mountain is on the boun-
daries of Bavaria, Bohemia, and Austria.

The lateral ridges which branch off to the north-east are
much lower and do not contain any lofty summits, but
some of them are of considerable extent; such particularly as the ridge which extends about 7 miles, from a
range where the high summits begin to rise, and which
fills the country between the Wollinca and Beraunca rivers
with high hills. This ridge is called Brdy-Wald. Farther
south is the Listi-Wald, which afterwards declines more to
the south, and entirely fills the country which the
Moldau forms in its upper course. [El.]

The breadth of this range averages only from twelve to
sixteen miles, yet it opposes great obstacles to the inter-
course between the countries along its sides, and account
of the steppes of its south-western descent, its narrow plateaux, and its rugged valleys, which are sometimes covered by a mantle of snow for a long time. The region is the most northern, which traverses the pass of Tirschenreuth, runs through the depression at its northern extremity, and connects the town of Eger with Ratisbon. Farther south is the road which connects Nürnberg with Pilsen, and is also the road of Silesia to Bohemia. The road from Ratisbon to Pilsen runs through the pass of Waldmünchen. From Passau two roads lead to Bohemia; one terminating at Klettau traverses the pass of Eisenstein, and the other leading to Strakonitz, the pass of Winterberg; lastly, the road between Pilsen and Ratisbon runs through the pass of Freistadt. Thus we find that only six roads run over a mountain range extending 112 miles in length, and two of them are at its extremities; they are consequently from twenty to twenty-five miles saunter. The difficulties of crossing these mountains are probably little prevented by the Germans from spreading farther to the east, and maintained the aborigines of Bohemia in the possession of their country and perhaps the Germans would never have entered it, had they not found the other mountain-ranges enclosing Bohemia on all sides. The climate of the inhabitants of Bohemia, which skirts the Bohemian side of these mountains is smaller than in other districts of Bohemia, the population being almost entirely composed of Christians.

Many rivers descend from this range. Some of them go to the Danube, and send their waters to the Black Sea; others fall into the Elbe, and go to the North Sea. Those on the south-western declivity have a short course, and fall into the Danube, which runs as a free stream, at the distance of the Regen, which joins the Danube opposite Ratisbon. On the side of Bohemia the rivers have a longer course. Here rises the Moldau, which is the true source of the Elbe river, and two of its most considerable affluent], the Wottowa with the Welinka and the Beranka. Most of the rivers of Bohemia are mostly composed of primitive rocks. The highest part of the ridge and its most elevated summits consist of granite. Gneiss everywhere accompanies the granite, but prevails in the forest of Budy, where it advances far into the interior of the mountain. Mica-slate also frequently occurs with the same tractive. Trinitic clay-slate frequently covers the granite and gneiss formation.

Though the highest part of the ridge is barren and nearly without vegetation, the lower parts of its slopes are covered with extensive fields of a loamy nature, while as the difficulties of the transport are great, it is impossible to bring the timber to a market, and consequently the forests would be nearly useless but for a fine white sand which is found in many places on the eastern slopes. This has given rise to numerous villages, where chalk is produced and known all over the world under the name of Bohemian, and is preferred to English glass in most countries of Europe.

Metals are found in many places. Native gold is met with at Horkowice in the district of Baram and in several other places, but in small quantity. Some rivers bring gold sand down, which is washed, especially the Moldau, the Saxawa, and the Wottowa. Silver is more abundant and worked with advantage in some places, especially at Przibram, where it is extracted from lead-ore. A small quantity of cinnebar is got near Horkowice. Tin is worked in a few places. Lead is very abundant at Mies, Przibram, and Bleistadt. The iron mines are numerous, and are worked with great industry. Antimony, zinc, and copper are also found.

Some precious stones also occur, especially opals, chalcedonies, and jasper, but the famous Bohemian garnets are not found in this range. Coal is found in considerable quantity on the northern lateral ranges, though they are less frequent than in the north-eastern districts of Bohemia. Great quantities of fine clay, fit for the manufacture of china ware, are found in the neighbourhood of Passau, and sent to many parts of Germany.

BOHEMIA, [Graz].

BOHEMIA, the eldest son of Robert Guiscard, the Norman conqueror of Apulia and Calabria in the eleventh century. After Robert had become duke of Apulia and Calabria, and his brother Roger had made himself count of Sicily, Bohemond, at the instance of his various experiences in Greece near Durazzo. His father returning to Italy, Bohemond remained in Ilyria with his Norman and Apulian army. In 1081, after the death of Emperor Thessaly, and besieged Larissa. At his father's death, in 1085, Roger, Robert's second son, took possession of Apulia and Calabria, and Bohemond on his return from Greece found himself deprived of all share of his paternal inheritance. Nevertheless, in 1087, Bohemond, with the help of the part of his nephew and namesake against Bohemond. A war ensued between the two brothers, which terminated by Bohemond accepting the principality of Tarentum, and leaving his brother Roger in possession of the rest. When the Crusaders set sail for the Holy Land, in 1096, the Crusaders took their way through Italy, and assembled at Bari to embark there. Bohemond, bold and aspiring, resolved upon joining them, and trying his fortune in the East. Being at the time in his brother's camp near Amalfi, the latter, to whom the knights of Bohemond assembled, warlike, painting to them in glowing colours the attractions and the merit of that holy war which was going to be carried on in Palestine; and he succeeded so well, that nearly the whole of his brother's army determined to accompany him. Amalfi, the lord of the Jews, claimed Bohemond for their commander. Roger being thus deserted by his troops was obliged to raise the siege of Amalfi. Both the prince of Salerno, and Tancred, the hero of romance, immortalized by Tasso, and the war-like adventurer of the Crusaders, and the songs of Enrico, son of Robert Guiscard, agreed to follow Bohemond's banner. The Norman and Apulian expedition embarked at Bari, and landed at Durazzo, the scene of Bohemond's former exploits. Bohemond, with a band of knights, took a line of advanced positions near Constantinople, and caused an approach to Constantinople mainly to contribute to induce the emperor Alexis to offer peace terms to the Crusaders. He was introduced to the emperor, who treated him with great distinction, and by his polite behaviour, aided by splendid presents, he prevailed on Bohemond and several of the other chiefs to swear allegiance to him for the conquests they should make in the East. Anna Comnena, the daughter of Alexis, has left a striking portrait of Bohemond. He was remarkably tall and handsome, his eyes were blue, his nose aquiline, his face beauteous, his body large, and his smile soft and pleasing, and he was said to be a very fair-souled man. His virtues were casting down, a deceitful, a despiser of laws and promises. In the arts of cunning policy he appears to have been quite a match for her father. After the capture of Antioch, Bohemond, being master of the town, divided the city into quarters, and gave them to his followers, and became lord of Antioch. The division of the Crusaders, was attacked by a vast multitude of Turks near Doryleum, and his division was mostly cut to pieces, but by his exertions he maintained the conflict until Godfrey of Bouillon came to his assistance and routed the Turks. Bohemond was greatly respected by the Turks, and warned them of the danger. He was desirous of obtaining possession of the town, Bohemond found out an Armenian renegade who enjoyed the confidence of the Turkish commander, and who agreed to introduce him and his men by night within the walls. Taking advantage of this he sent several men to seize the possession of Antioch on the condition that they should bestow upon him the principality of the town. Some of the leaders demurred to this, but the Armenian could treat with Bohemond only; the Christian camp was suffering for want of provisions, and Kerbogha, the sultan of Mosul, was advancing against them with a large force. No time was to be lost, and all the chiefs, with the exception of Raymond of Toulouse, agreed that Bohemond should be prince of Antioch. The following night Pierous, the Armenian, and Bohemond, under the protection of the Turks, when nearly all the Mussulman population was massacred, June, 1098. At break of day Bohemond's red standard was seen flying over the loftest tower of Antioch. The Christians were soon after besieged in their turn by Kerbogha, and after suffering the extremities of hunger they came out to offer the Sultan battle, in which the Saracen and Turks were completely routed, and Bohemond greatly signified himself. When the Crusaders left Antioch in the spring of 1099 for Jerusalem, Bohemond accompanied them as far as Lacedaemon and then returned to Antioch to consolidate his new possession. He afterwards received the investiture of his principality from the patriarch Daimbert at Jerusalem. In an excursion into Mesopotamia he was taken prisoner by a Turkish emir, and remained two years in captivity. Both the sultan of Iconium and the emperor Alexis offered large sums to the emir in order to obtain
Possession of Bohemond, who however continued to persuade the emir to accept his own ransom, although of less amount, and to make alliance with the Christians against the sultan of Damascus. In 1161, he left Antioch and went to Apulia in France, where Philip I gave him his daughter Constance in marriage: Philip's natural daughter Cecilia married Tancred. Upon Bohemond's return to Italy he collected a large force, and sailed from Bari for Durazzo. After several combats with Alexis' forces, he had an interview with the emperor, in which the latter acknowledged him prince of Antioch. Bohemond died in Apulia in 1111, and was buried at Canosa. His son, Bohemond II., succeeded him as prince of Antioch. (See Gibbon, William of Tyre, Maister's Chronicle of Robert Guiscard, and Michaelis, Histoire des Croisades.)

Böhme, or BÖHM, frequently mis-written BEHMEN. In relating Böhme's life we retain the characteristic quaintness of his age.

There is a small market-town in the Upper Lusatia called Alt-Seidenburg (Brucker writes Patel-Seidenburgum), distant from Görlitz about a mile and a half, in which lived a man whose name was Jacob, and his wife's name was Ursula. They were poor, but sober and honest. In the year 1575 they had a son, whom they named Jacob. This son was of an extraordinary birth, being the son of the Teutonic philosopher. His first employment was the care of cattle, but when grown older he was placed at a school, where he learnt to read and to write, and was afterwards apprenticed to a shoemaker in Görlitz. Having served his time, in the year 1596 he took to wife Catharine the daughter of the butcher Johann Hunschmann, a citizen of Görlitz, by whom he had four sons. His sons he pleased honest trades. He himself became master-shoemaker in 1595.

Jacob Böhme relates that when a herdsboy he had a remarkable trial. In the heat of mid-day, retiring from his playfellows he went to a stony crah called the Landskron, and, finding an entrance or aperture overgrown with bushes, he went in, and saw there a large wooden vessel full of money, at which sight, being in a sudden astonishment, he retired in haste without touching it, and related his fortune to the rest of the boys, who, coming with him, sought often an entrance but could never find any. Some years after a foreign artist, as Jacob Böhme himself related, skilled in fables, stories, took it, and by the book much enriched himself; yet he perished by an infamous death, that treasure being lodged there and covered with a curse to him that should find and take it away.

He also relates that when he was an apprentice, his master's son, being a abbe who loved and came to the shop a stranger, of a reverend and grave countenance, yet in mean apparel, and taking up a pair of shoes desired to buy them. The boy, being yet scarce promoted higher than sweeping the shop, would not presume to set a price on them; but the stranger, having imparted, Jacob at last named a price which he was certain would keep him harmless in parting with them. The old man paid the money, took the shoes, and went from the shop a little way, when standing still, with a loud and earnest voice he called, 'Come, Jacob Böhme! take these from the shop a boy of princely birth, and sacredness called, much enriched; yet he perished by an infamous death, that treasure being lodged there and covered with a curse to him that should find and take it away.

He also relates that when he was an apprentice, his master's son, being an abbe who loved and came to the shop a stranger, of a reverend and grave countenance, yet in mean apparel, and taking up a pair of shoes desired to buy them. sician, Balthasar Walter, from Silesia, who had travelled in search of antient magical learning through Egypt, Syria, Arabia, &c., where he found such small remnants of it, that he returned unsatisfied, addicted to his own country, where he became inspector of the chemical laboratory at Dresden. Having become acquainted with Böhme, he rejoiced that at last he had found at home, in a poor cottage, that for which he had travelled so far in vain. Walter introduced the ap-

er to Böhme. 

B. Walter went to the German universities, and collected such questions concerning the soul as were thought and accounted impossible to be resolved fundamentally, of which he made a catalogue, being forty in number, and sent them to Böhme, for which he received answers to his satisfac-

tion (which answers are public in many languages). Bal-

thasar Walter came to Böhme and professed that he had received more solid answers than he had found among the best wits of those and more promising climates.

The physician at Görlitz, Dr. Kober, arranged his burial, which was performed with the usual ceremonies, to the due performances of which the clergy were compelled by the magistrates. His friends placed a cross on his grave, but it always remained with new wood. Jacob Böhme's wife died of the plague two years later. One of his four sons was a goldsmith; the others had learned other trades. All died soon after J. Böhme.

He was lean, and of small stature; had a low forehead; his eyes were grey and very sure; his beard was thin and short; his voice low, but he had a pleasing speech, and was modest and humble in his conversation. He wrote very slowly but legibly, and seldom or never struck out and cor-

rected what he had written. 

After Böhme's death his opinions spread over Germany, Holland, and England. Even a son of his persecutor Richer-

bois, being then a merchant's clerk at Thorn, edited at his own expense an epitome of Böhme's works in 8 volumes, and arranged their sheets in a sort of index. The younger Richer became fond of Böhme's doctrines while he at-
ttempted to refute them. He printed of his extracts only about 100 copies; consequently they are now extremely scarce. The first collection of Böhme's works was pub-

lished by Gichtel in 16 volumes, 1690. Four more collections followed, one in 1695, another 1702, the last one in

1738. The works of Böhme were published and translated into Dutch at the expense of and by Abra-

ham Wilhelm van Beyerland, who had bought a complete library of Böhme's works from Count Schuida at the Baumgarten, at Görlitz. Beyerland also procured autograph copies, which he collated for his edition. Beyerland's editions are in 12mo, 8vo, and 4to. More complete than Beyerland's is the edition by Gichtel in 19 vols. 8vo. Amst. 1675. The text is at least as accurate as the editions of the heirs of Beyerland. This was reprinted with Gichtel's manuscript marginalа, Altona, 1715, 2 vols. 4to., and again with a notice of former editions and some additions from Gichtel 's Memorials, 1720. There are some later editions of separate works. The edition, translated into English is that by the celebrated William Law of Oxford, Lond. 1764, in two volumes 4to. Compare also Ja-

cob Böhme's 'Theosophic Philosophy, unfolded by Edward Walter, expressed in the account of the life of J. B. London, 1691-4; Jacob Böhme ein Begründer der deutschen Metaphysik, 1818-8; Jacob Böhme's Werke, Amsterdam, 1620, four volumes 8vo, 1626-8, 1698, and 1730, in ten volumes 8vo. Auszug aus Böhme's Schriften, Amst. 1718, and Francfurt, 1791-8. Also Dutch and German translations. The preacher and physician John Pordage, who had written about Böhme, was born in London 1669, endeavoured to systematize the teachings of Böhme in the following works: 'Metaphysica vera et divina. This is translated into German in three volumes, 1783. 'System der Theologie,' Weimar, 1789-91. 'Deo in omnibus sapientia et dominio universae,' translated into French by Louis de Jaucourt, 1729-90. 'A further Lucorum habitum in monastic and contemplative life,' by Durand Hotham, Esq. 1764, 4to. 'Memoirs of the Life, Death, Burial, and wonderful Writings of Jacob Behmen, now first done at large into English from the best edition of his works in the original German, with an intro-
duction pointing out the late translation of the right use of this mysterious and extraordinary Theosopher,' by Francis Okeley, formerly of St. John's College, Cam-

bridge, Northampton, 1670, 8vo. 

Claude St. Martin, who died at the beginning of the present century, published French translations under the title 'La philosophie mystique de Böhme.' "Des Trois Principes," "De la Triple Vie;" "Des Quantre Questions;" "Censura Philosophiae Theutonice seu epistolae de Bohnio illusorius philosophia in Heur. Mori Oper. omn." (philos.) Lond. 1679, fol. tom. 1, 419 sqq.; extracted with additions in J. J. Oly, J. J. Haer, Hist. Ecc. Sec. xii. Ham-
against those additions
One of the most zealous supporters of Böhme's theosophy was the poet H. Mori, who wrote a poem in his praise, which
that name, which has produced not only political but also
theosophical martyrs. See 'Ad Philosophiam Teutoniam
manu conditum seu determinatio de origine animae humanae,
was an Aedoe cretor et infundator, an a parenibius tra-
ducere et traditum est. His views on the structure of
Schleiermacher, Martiis 3. 1646. A Carolo Rotham socet Petrensi et tune
uno ex procuratoribus academiac. LUND. 1648.'
The following title will show that the disputes about Böhme
became very warm. 'A true state of the case of Mr. Ho-
Böhme, lastly, and of the 25 German academies, and the
reasons of his appeal to parliament against the sen-
tence of those members of the committee for reforma-
tion of the universities, who on May 22 last resolved: the writing
and publishing of his book entitled The Petition and
Aggregate of Reasons and Arguments against the prueba
of parliament, and himself to be deprived of his
Enrollment in that college.' Printed in the year 1651.
Böhme and his followers were especially persecuted by
the clergy, who seemed to deem his writings on theosophical
subjects an infringement of the prerogatives of the clerical
order. The ecclesiastics at Görlitz persecuted Böhme during
his life, and refused to bury his corpse until they were
compelled by the magistrates not to disgrace the earthly
reins of a man who had led a harmless life and always been
useful to them. The early admiring of Böhme were for the greater part not pro-
essional divines, but noblemen, country gentlemen, cou-
tiers, physitianists, chemists, merchants, and in general, men
who were eager in the pursuit of truth, and who did not
stick at the breach of the church's and secular
formalities. The persecutions raised against him brought Böhme first
into the notice of men of rank, who took delight in con-
versing with the poor shoemaker and his followers, while
universities and ecclesiastical courts enacted laws against his
opinions, and his persecuted disciples appealed even to
England to the high court of parliament. Sir Isaac Newton,
William Law, Schelling, and Hegel, were all readers of
Böhme.
William Law, in the appendix to the second edition of his
Textbook of Fables or daubles or daublae Truths of the
Gospel, 1756, mentions that among the papers of Newton
were found many autograph extracts from the works of
Böhme. Law conjectures that Newton derived his system
of fundamental powers from Böhme, and that he avoided
mentioning Böhme as the originator of his system, lest it
should come into disrepute.
Böhme's theosophy consists in the endeavour to demon-
strate in every thing its necessity by tracing its origin to the
attributes of God. Consequently some of Böhme's phrases
sound sounding, and his explanations may have been misinterpreted as being such. Böhme traces
the parallelism between the visible physical, and the
invisible metaphysical world. His comparisons and images
are not the essence of his theosophy, but only illustrative
of thoughts which he commanded the admiration and
approbation of some of the deepest thinkers, while others
are apt to neglect him entirely on account of his errors
in subordinate non-essentials. Böhme forms undoubtedly
an important link in the chain of thought, which connects the present theosophy with the beginnings of former
ages. He often produces magnificent ideas, but he occa-
sionally supports his theory by false etymologies, and by
chemical and astrological notions which have been long
ago rejected. A specimen of false etymology is his deri-
vation of the word qualitat. (i.e. quality) from the German
Qual, i.e. pace, and que, i.e. well, fountain, source.
He has now again many admirers in Germany, but perhaps
no one would approve of this mode of demonstration.
The articles on Böhme in English works are often very
incorrect. The word Böhme (Jacob), a shoemaker, liv'd at Görlitz, was re-
markable for the multitude of his patrons and adversaries.
He derived all his mystical and rapturous doctrine from
Wood's 'Atheo Oxiottines,' vol. 1. p. 610, et 'Histor. et
Ani. Acade. Acad. Petrensis,' p. 308. Wood was
born in 1622, eight years after Böhme's death.
BÖHMISCH LEIPA. [LEIPA.]
BOHODUKHOFF, or BOGODUKHOFF, a town in the
Russian government of Charkoff in the Ukraine, and the
capital of a circle of the same name, is situated on the
Meria, a small river which flows into the Vorskla. It was
built in the year 1657, and is surrounded by rams of
about 1000 houses, and nearly 7000 inhabitants, whose chief occupa-
tion is tanning and preparing leather, as well as working it
up into boots and shoes. Large flocks and herds are reared
in its neighbourhood, and the place accordingly carries on a
very considerable trade. Numerous admirable quantities of fruits and vegetables are also raised
about Bohodukh'off. 50° 10' N. lat. 35° 40' E. long.; 1451
yards (about 987 miles) distant from St. Petersburg.
The circle to which this town gives its name, lies between
and 50° 40' N. lat. 30° 40' and 30° 40' E. long. The
area is about 1140 square miles; above three-fourths of
this area are cultivated by the plough or the spade, and
less than one-seventh part is occupied by woods.
The number of inhabitants has increased during the last fifty
years, from 9000 in 1657, to about 25,000 at present. The
towns: Bohodukh'off; Krhomynsk, a walled town on the
Meria, with five churches, 800 houses, and about 5000
inhabitants; and Solostashe, a walled town on the Uda, with
four churches, nearly 1000 houses, and 2500 inhabitants,
who are actively employed in cultivating grain, fruit,
and vegetables, and rearing cattle.
BOI, a nation of antient Gaul, which made various immi-
grations into Italy and Germany. The district whence they
are said to have originally emigrated is in the ancient
inscription 'L'antique Gaule'), but it would appear that they were near the
Lingones and the Helvetii. They are mentioned as forming part of the first Gaulish emigration recorded by
Livy, Justinus, and others, which set off in quest of new
lands. The Bovii, kald Boves, and the name is that of the
nephews of Ambigius, king of the Bituriges. Belvesesus
went over the Alps into Italy, while Segovesus crossed the
Rhine into Germany, and penetrated to the skirts of the
great Herceyntian forest. The Boii would appear to have
followed Segovesus, and to have settled in the heart of Ger-
many, in the country called after them Boiohemum (Bohe-
min), from which they were afterwards driven away by the
Marcomanni, a German nation, and withdrew south of the
Danubius, to the banks of the Cénaus (Inn), Bojoudrum,
and Odenviriam. They settled near the Danubius,
taking possession of the Truscan city of Felasina, afterwards
Bononia. [BOLOGNA.] The Boii were often engaged in
war with Rome, and they obtained at times advantages over
the Roman arms, but they were finally subjugated by Scipio
Nasica, and part of their lands was taken from them.
As they still continued restless, they were altogether removed by the
Romans and sent across the Noric Alps, when they settled on the banks of the Dravus, near the Scordisci,
some remaining after a few years in the country of the
Graii, who were almost entirely destroyed; and we find in Pline (iii. 24.) a vast tract between the Dravus and the Danubius called
'Deserta Boiorum.'
We find the Boii engaged in the Helvetic immigration
into Gaul in the time of Caes. Whether these were from
some part of their tribe which had remained in Gaul, or
whether they came back from Germany into Helvetia,
is not known. After the defeat of the Helvietians, the
Adiuz begged of Caesar that the Boii might remain among them,
which being assented to, they settled in a district in be-
tween the Ligurias and the Elaver (Allier).
The Boii, from Bohemia, who had settled on the banks of
the Cénaus, became subject to the Roman empire, and formed
part of the province of Vindellinia. During the decline of
the Roman empire to the 16th century, they were
in constant intercourse with the Celts of Boio-
comanni, the Thuringii, and other tribes who occupied their
country, which afterwards took the name of Boioria, or
Boiaria, some say from the united names of the Boii and the
Avari, a Pannonian tribe. From Boiaria the modern appel-

While recourse is had to these external applications it is indispensable to correct the disordered state of the organs. This may be accomplished by the use of mild alternative medicines: the bowels should always be freely opened at first, and then regulated by gentle unirritating laxatives. At the same time strict attention should be paid to the diet, which should be of the simplest kind, containing no inflammatory or irritative but not stimulating, consisting of a moderate portion of plainly cooked animal food, without fermented liquors, without pastry, and without fruit.

BOILEAU, NICOLAS, SÉUR DESPREAUX, was born at Crussé, near the town of Vienne, in the department of the Drôme, and in Paris itself, on Nov. 1, 1636, and was the eldest child of Gilles Boileau, first Registrar (Greffier) of the Great Chamber of the Parliament of Paris. His mother, the second wife of Gilles, was Anne de Niels. Boileau has written inscriptions, little worthy of remembrance, and among them he eulogises his father as a man of probity and of gentle disposition, rather than as possessed of much talent; and of his mother, who died during his infancy, he says nothing more than that she pleased her husband by reflecting his good fortune.

Each of two elder brothers of Nicolas Boileau attained some distinction in his time. GILLES, born in 1631, pursued the law, and became successively Paymaster of the Hôtel de Ville in Paris, and Controller of the Royal Treasury. Louis joined the French army, and covered himself with glory. He afterwards cancelled, for having obtained a pension from Colbert, through the interest of Chapelaine: but he has allowed a small epigram to be transmitted to us, in which, perhaps ironically, he extols the literary and oratorical abilities of his brother.

The internal organs, the derangement of which most commonly produces disease, are those which belong either to the digestive or to the excrementitious systems, or to both. In consequence of the disordered state of these organs, either perfectly pure chyle is not eliminated, or the blood is not properly depurated, or excremenitious matter is re-absorbed into it, the circulating fluids become contaminated, and the result is the irritation and inflammation of the surface.

The rational and successful treatment of this disease must therefore be directed to the objects of the malady, and the correction of the disordered state of the system in which it has its origin. The first intention is accomplished by assisting the process of suppuration, which, as already stated, is always tardy and imperfect, but must be hastened by a liberal use of warm applications, by the use of poultices, by incising and evacuating, by the use of warm baths, and by the application of warm fomentations. The premature application of cold or of ice is what should be avoided.

Jacques Boileau was born in 1635, and studied at the College of Harcourt, where he graduated in theology. He later served as a curé in different parishes of the diocese of Paris. Boileau died in 1716, at the advanced age of eighty-two. His avowed works are numerous, but chiefly on forgotten questions of theology; and he wrote much also either anonymously or under feigned names, as Marcellus Aeneasinus, Claudius Fonteius, Jacques Barnabé, &c. A complete list of his works is not known, but many of them are now lost.

We have therefore omitted to narrate the whole story, and we shall here mention the only one which is now occasionally remembered, 'Historia Flagellantum, sive de recto et perverso Flagellorum usu apud Christianos,' Paris, 1700, 12mo. The word recto was inserted before this volume could obtain the approbation of the Jesuits. Boileau wore the old fashion with which the author has visited the abuses of superstitious penance occasioned much scandal, and exposed him to numerous attacks by zealots, which probably he had anticipated, and which certainly he disregarded. The treatise might as well have been left in the original Latin garb, but it was translated into French about a year after its appearance; and this version was republished in 1732 with many omissions, much softening, and an historical preface. It has also been rendered into English by De Vere Stansd, 1669. Boileau, who seems to have observed, showed that he was a man of wit. When some one asked his opinion of the Jesuits, he described them as people
who lengthen the creed and shorten the decalogue; and to an inquiry why he had written in Latin, he replied that he wished to escape perusal and persecution by the bishops. The biographers of Nicolás Boileau, who prefix his birth to Paris, name also the very house at which it took place, at the corner of the Quai des Orfèvres and of the Rue de Harley, adding that the chamber in which he first drew breath was the same in which the Satire Monnepée had been composed, and that, upon the conclusion of the immediate work was the production of many different hands, we know not how to attach credit to the tradition; whether we are to suppose that Pierre le Roy wrote the original few pages round which the larger volume afterwards accumulated, in the room which, seen to the eyes of our countrymen, or whether his secretary hired was brought thither their respective contributions. It is said that Boileau while in the cradle was attacked and fearfully mutilated by an enraged turkey-cock; and that, in addition to this infantile calamity, he never completed the work for the stone performed while he was in his boyhood. To these causes Helvétius attributes what he terms the coldness of Boileau's poetry, which, although written during a period of unbounded licentiousness, rarely, if ever, presents any amatory disposition of the whole of his published works. His education, his predominant taste was discovered by Serin, one of the Professors. Nevertheless the future guide of the French Muse was not at all distinguished by precocity in the pursuit through which he afterwards gained so much until he had found his happiness both for the bar and for the pulpit, that he devoted himself altogether to Parnassus. Long family connexion indeed appeared to bind him to the first-named of these professions: he felt that he was

\[\text{File, frère, cousin, beau-frère de greffiers} ;\]

yet at the same time being a great sleeper, accustomed to lie very late in the morning, and to nod after dinner (in all which particulars his biographers have discovered resemblance to Pope, and might have done so to Horace, &c.), he tells us that at the Palais

\[\text{Il est de ma nature une Muse offensive.}
\]

\[\text{Dormir chez un greffier la grasse matinée.}\]

The Law therefore had few attractions for him; and although he obtained from the Church a Priory of 800 livres annual rent, he afterwards resigned it, and most honourably distanced in charities the whole of his beneficed receipts. His earliest poetical attempts were in Satire, by which he nullified a prediction made by his father, who, when comparing the genius of each of his three sons, used to say, 'that as for Colin, he would never speak ill of any body,' which, after Boileau's publication of 1665, with a preliminary address to the King (a formula not to be omitted by any author who courted popular notice), were playful and sporting, not rabid and virulent; they showed, as he used to observe of himself, neither fang nor talon, and when the Treasurer's clerks, a matter-of-fact man, one day inquired where were the 'works for which the order instructed him to make this payment, the poet amused himself by answering, that he was a 'builder.' He was also appointed joint Historiographer with Racine; to which office which, nobly discharged the brunt of the master's exploits, appears to have been regarded by both of them as a sinecure, unless so far as they contributed some illustrations to a Magalda History. So well however were Boileau's habits and manners adapted to the harsh critic whom he encountered in it, the rigid Duke of Montausier, who at first had not scrupled to pronounce that the satire which had been unprovoked must of necessity be ill-natured. In 1664 Boileau had the melancholy task of announcing to the King the death of his historiographical colleague: Louis, who had his watch in his hand at the time, paid him the high compliment of saying, that notwithstanding his many engagements, an hour in every week should be reserved for the entertainment of his favourite. It was during this time that Boileau was admitted a member of the Academy. Twelve 'Epitaphe,' which flow with much greater ease than the Satires, were produced between 1669 and 1696. The 'Art of Poetry,' accompanied by a translation of 'Longinus on the Sublime,' into a Magazine or an Anthology, 'Les Requêtes,' in which year also appeared four cantos of the 'Lutrin,' a mock-heroic, suggested by the President Lamoinon. In the preface to the first edition, Boileau thought it prudent to deny that the argument had any foundation on fact; but in a letter afterwords, when he felt assured of his own safety, he made a sort of full apology. The whole truth, the Parisian Consuls wisely joined in the harmless laugh which had been raised against them. Nevertheless, there were critics who fastidiously decried the rich comic vein which they wanted to stifle, and in the Journal des Spectateurs, we find the following censure:—"It is perhaps that one of his works which has been least nibbled by the critics. It contains some matters which seem ultra-comic, as the Episcopale Benediction, which is altogether burlesque, and a little too much in the taste of the Louviers and libertines."

The two concluding cantos were not appended to the 'Lutrin' till ten years after its first appearance. The minor poems which escaped Boileau from time to time are altogether unworthy of him. The satirical poem 'On the Capture of Montauban' by Louis XIV., in which it is natural to suppose that the author's utmost care was expended, is tame, cold, and spiritless; and his occasional verses, if written in our own days, would scarcely find gratuitous admission into the Magazine of A. de Villiers de L'Isle Adam, or in a Dialogue after the manner of Lucian (as all Dialogues at that time were said to be), is the chief of his original prose works. It was written in the beginning of 1665, and it very pleasantly expresses the absurdity of Honoré de Gourmont's left, Madame de Maintenon's right; it probably gave a death-blow to the 'Astrée,' the ' Cyrus,' and the 'Cléides,' and it formed part of a controversy which at that time raged in France, and which produced lasting enmity between Boileau and Fontenelle—the comparative merits of the Homer of the ancients and the Homer of our own times. Boileau lived till 1706 in familiar intercourse with the choicest contemporary writers, and in the enjoyment of the best society of the capital.Repeated attacks of infirmity and an increasing deafness then warned him to retire, and he closed a very blameless and honor, was pacific, peaceful and piously, on March 13, 1711, having exceeded his 74th birthday by a few months. Boileau is one of that scanty number of poets who have left behind their

\[\text{No line which, dyying, they would wish to blot.}\]

and the high moral standard of his writings may be best estimated by the innocence of the very expressions to which the enmity of Perrault objected. Boileau in his 10th Satire, while denouncing the Opera, speaks of the

\[\text{Héros d'octe luxurieux, et de la morale lugubre.}\]

These terms were gravely represented to be offensive to modesty; and the silly charge awakened no less a champion than Arnauld, whose letter, together with a grateful acknowledgment which it received from Boileau, is printed in the edition of his works. 'What is an author's profession? ' inquired a country priest unacquainted with his person, upon receiving him in the confessional. 'To make verses,' replied the penitent. 'So much the worse. And what sort of verses?'—'Satires.'—'Worse and worse still. And against whom?'—'Against those,' answered Boileau, 'who themselves write bad verses; against works so mis-
chlevous as Operas and Romances.'—'Ah, my friend,' inter
rupted the confessor in conclusion, 'there is no harm in
this, and I have nothing more to say to you.'
It is justly therefore that he puts into his gardener's mouth a couplet, which speaks no more than truth of the charac
ter of his poetry:
'Mon maître, dirôla-tu, passe pour un Docteur,
Véritable docteur en sans-souci.'—Ep. xi.
The eulogy indeed is only the veneration of a compli
cent which he really did receive from some citizens of Paris, who had passed the day in his company. At parting, they assured him that they had occasionally travelled in the same diligence with even Doctors of the Sorbonne, but that they had heard so many fine things said by a single mouth. 'In fact, Sir, you talk a hundred times better than any Pupilteer.'
His purse was always open for purposes of benevolence.
When ingenuity compelled the Advocate Patin to dispose of his library, Boileau paid largely a third more purchas
ing money than had been offered for the collection, at the same time signifying that he bought only the reversion, and that the books were to remain the property of their original owner during his lifetime. In a similar spirit, he prevailed upon the King to continue the pension to Cornelle, which had been revoked on Colbert's death; observing, that he himself should feel ashamed of participating in the national bounty, if so great a writer as Corneille were excused from it.
The French critics are much inclined to compare Boileau with Pope, and naturally to give preference to the former; but, we think, so far as they admit comparison, the English poet may encounter it without apprehension. Both of them were born near the close of the sixteenth, and at the age of Boileau's death, the former had the ad
vantage of one additional modal, which there cannot be a doubt he studied very attentively. There are passages in the works of Pope which are undistinguished translations, and which he hoped to be so. Every reader will at once per
ceive that the Fable of 'Justice and the Oyster' is one of these, which apologist Boileau transferred from the close of his first Epistle to the King, where it originally stood, to its present more appropriate place, at the end of the second Epistle. Pope has applied to Dryden that which Boileau said of Moïre:
"I'ignorance et l'erreur à ses hautes mains places,
En haïssable Marque, en ruine des Comédiens,
Venuent pour dresser son chef d'œuvre nouveau.'
"Frida, malice, folly, against Dryden rose.
"From grave to gay, from lively to severe,' as Boileau had already determined.
"'D'une voix légère
Passer du grave au doux, du plaisant au sérieux.'
Memory or observation will supply innumerable other close parallels; and the 'Essay on Criticism' especially, one of Pope's very large and twenty-one years ago, is very similar to the 'Art of Poetry.' A remark however which has been made on Boileau himself, is not less applicable to Pope also; and is perhaps most of all applicable to him when he imitates Boileau—that he seldom borrows but to improve; that he abhors, according to a forcible phrase of La Bruyère, créer les pendes d'autrui.

One striking example of inferiority is adduced by Warton. Pope says (and he says it weakly and obscenely, notwithstanding the preceding line has become proverbial),—
"No place so named of the boyo
Nur is Paul's church more safe than Paul's churchyard;
Nur, by to alter, there's they'll talk you deep,
For fools rush in where angels fear to tread.'
This satire is forced and unnatural, whereas the passage from which it is borrowed was suggested by a real inci
dent:
"Gardes-vous d'imiter le susceptible ferioue,
Qui de ses vaines cécile lecture harmonieux
Abuse en chantant quiconque sa balle,
Et pourroit de ses vers les passans dans la rue;
Il est inutile des saugens de comique,
Qui soit contre au mus un lieu de satire.'
"which verses," says Warton, "allude to the impertinence of a French poet, called Du Perrier, who finding Boileau one day speaking to the King upon requisition to him an Ode, during the elevation of the Host, and decried his opinion whether or no it was in the manner of Malherbe.'
The 'Moral Essays' are immemorially superior to the
"Satrie,' insomuch as Pope looked abroad into the word
and upon mankind, while the narrower view of Boileau was cirkuscodeert of his own and Ma
darinque. Each has failed in his poetry; and it now seems as if the captivations of the heroic couplet were indis
tensible for the development of their full powers, for the exhibition, if we may so speak, of their pages: yet Pope, more especially in his translation, has approached to the downright epigram with which the 'Ode sur la Prise de Namur' concludes. The 'Rape of the Lock' is far richer in imagery and much more playful in expression than the 'Lutrin'; and after-thought, which added to the one its great strength, is not heard of in the other. If the two more cantos with the lumbering personifications of Poetry and Justice. Of the sentiments which inspired the greatest effort of the English bard, the ' Eloise to Abe
lard,' Boileau, as we have already hinted, was perhaps more specifically original; and the version of Homer there can be little doubt that he would have shrunk in dismay.
Yet, after all the assertions of minute criticism, Boileau deserves a much higher station than he is allowed by Fontenelle. From the charge of poetical feeling he has been well defended by La Harpe, who says even of the 'Satrie' (among which he reckons the eleventh as the chef d'œuvre)—'I like to read them, because I like good poetry, good wit, and good sense.' La Harpe is by no means a man whom we imagine such a thing as censure the 'Ode on the Capture of Namur.' He also very searchingly examines an opinion expressed by Boileau that Molière was the greatest genius of the age of Louis XIV.; and the whole chapter of the 'Lycée,' which is upon this subject, is very instructive and edifying. It is a delightful commentary with which we are acquainted on a silly lit
erary dispute, which has been agitated more violently upon the Continent than among ourselves, and which will last as long as the tempers of men continue to be divided as sanguineans and pessimists. M. de Voltaire, himself, is, in another, giving him the languid praise of being the cor
rect author of a few good pieces, he neutralizes even this measured applause, by adding that he was the Zolius of Quintain, and the flatterer of X, and finally, he con
tradicts himself by stating in a third passage, that 'in any doubt the 'Art of Poetry' is the work which reflects more honour than any other on the French language.

BOILING OF FLUIDS. When certain fluids are heated to a much higher temperature, they will boil, and produce much vapour, they are said to boil, or suffer ebullition. Under similar circumstances the temperature at which this occurs is always the same in the same fluid, and is called its boil
ning point, being the greatest heat which the fluid is capable of acquiring; when the vapour which escapes from boiling fluid is condensed, the resulting liquid is perfectly similar to that from which its vapour was produced, having suffered no chemical change.

There are some substances which usually exist in the fluid form, or which may be made to assume it, by being heated, that cannot in strictness be said to have any fixed boiling point; and there are others that cannot be made to boil: thus when certain fixed oils are heated, instead of being condensed and yielding inflammable gas; and the greater number of the metals, when heated and ren

dered fluid, suffer no ebullition, because they are incapable of being vaporised. The circumstances attendant upon the boiling of water will, upon the more familiar illustration of the nature of ebullition than those accompanying the boiling of any other fluid: we shall therefore commence with an account of them.

When water is heated, there is a point, just before it has acquired its highest temperature, at which a slight noise, or rather a succession of noises is heard, usually called simmering. This is occasioned by the formation of minute bubbles of vapour, at the bottom of the vessel, and near the source of heat, which, being specifically lighter than the water in which they are formed, rise into the upper and cooler part of it, and are then condensed. Soon after this, and when the whole of the water has acquired its highest temperature, the bubbles of vapour rise to the surface, and there burst. The steam, which, being transparent and colourless, is consequently invisible, but when it comes into contact with the cold air, it undergoes partial condensation, and is then visible, and appears as a mist.

The boiling point of water, which on Fahrenheit's thermometer, used in this country, is 212°, is subject to variation by altering the circumstances under which the ebullition takes place. Thus when it is stated to occur at 212° Fahrenheit, it is understood that the water is freely exposed to the air, and that the barometer stands at 30 inches, which is the barometric pressure at the height of the observation.

It is well known that the atmosphere presses with a force equivalent to a weight of fifteen pounds on every square inch of surface. By variations of this pressure the boiling points of fluids suffer great alteration; when it is increased the temperature of boiling fluid is raised, when it is lowered, by diminishing the pressure. Boyle appears first to have noticed these circumstances during his experiments with the air-pump; and it was afterwards observed by Fahrenheit that there was an occasional variation in the boiling point of water by the same thermometer was used at different times: this he found to depend upon the alterations of barometric pressure.

General Roy instituted a set of experiments to determine the temperatures at which water boils at the different heights of barometer, and the following table contains a statement of his results:

<table>

</table>

It appears from this table that the boiling point of water varies 0.8 of a degree for every half inch of variation of the barometer, and consequently every tenth of an inch which rises or falls alters the boiling point of water 0.176 of a degree of Fahrenheit's scale.

Dr. Thomson (Heat and Electricity, p. 307) states that since the year 1817 to 1839 (both inclusive) the barometer has never been higher in Glasgow than 30.8 inches, nor lower than 28.417 inches, so that the boiling point of water has varied during that period from 213.4° to 201.6°, or almost 41° of Fahrenheit.

On ascending mountains, by the consequent diminution of atmospheric pressure, and in proportion to it, water is found to boil at a lower temperature. Thus on the summit of Mont Blanc, which is about 15,000 feet above the level of the sea, Swaunac found water to boil at 176° Fahrenheit, 41° below its usual temperature.

The effect of diminished pressure in lowering the boiling point may be readily exhibited: remove some boiling water from the fire, and ebullition soon ceases, but it is renewed by placing it under the receiver of a vacuum pump, and using exhausting pump, and another and very simple method of producing the same effect is by boil some water in a Florence flask, pour it while boiling, remove it immediately from the fire, and immerse it almost entirely in cold water, and then ebullition will recommence. This is occasioned by the sudden condensation of the steam which occupied the upper part of the flask, and the consequent formation of a vacuum; the existence of which is proved by the rush of air into the flask on removing the cork.

According to the Rev. Mr. Wollaston (Phil. Trans. 1817), an elevation of 530 feet causes a diminution of 1° of Fahrenheit in the temperature of boiling water; but it will be observed that this determination, which is probably an accurate one, does not agree with the stated height of Mont Blanc, or the barometer at that place, which is about 30 inches.

Professor Robison states that fluids boil in vacuo at 140° lower than under atmospheric pressure; consequently water so circumstances will boil at 72°. Dr. Thomson informs us that he has seen water boiling briskly at 98° in Mr. Barry's apparatus for distilling oils in vacuo.

We have now described the circumstances under which the boiling point of water is lowered by diminishing the pressure; and we shall proceed to show how, by increasing the pressure, the boiling point is raised.

When water is heated in vessels from which its vapour cannot escape except by overcoming pressure, its boiling point is very much raised. This experiment may be made in Papin's digester, which is a strong iron or copper vessel, with a tight-fitting lid screwed down, and provided with a safety valve, loaded with any proper quantity of weights. In this way water may be heated to upwards of 400°; indeed, according to Muschenbroek, the temperature of water can be raised so as to melt tin, which fuses at 452°. A more convenient apparatus for this purpose is the atometer by the late Dr. Marcet. In this the pressure is indicated by the height to which the steam raises a column of mercury, and the thermometer is shown by a thermostat. (Dr. Henry's Chemistry, vol. i. p. 126.)

According to the atometric experiments, the following atmospheres produce the annexed pressures and temperatures:

<table>

It is to be observed that the temperature of the steam is always equal to that of the water from which it is generated. When however what is termed high-pressure steam is suffered to escape into the atmosphere, its temperature is greatly reduced, not merely on account of the cold air with which it comes into contact, but by the great expansion which it undergoes, and the consequent conversion of sensible into latent heat. In this case it is so far from scaling like atmospheric steam, that it may be received upon the hand without feeling even an unpleasant warmth. The vessel is boiled in vessels which are not furnished with safety valves, or when from any accident they do not act or are overloaded, the strongest boilers burst with a tremendous explosion.

There are several circumstances which influence the boiling point of water beyond what has already been said, but not to so great a degree. M. Gay Lussac found that water boiled exactly at 212° in a vessel made of tin plate, while in a glass one it acquired 214°; and he concludes that the boiling point varies according to the nature of the different vessels, and the state of the air with which the ebullition takes place, and consequently depends on their conducting power and the polish.

Dr. Bostock also found (Annals of Philosophy, vol. xxv. p. 196) that the boiling point of water in various vessels and is approximately 217°. A saturated solution of common salt was placed over a lamp, and gradually heated up to 225° when it boiled strongly; a test tube, containing water deprived of air by boiling, was plunged into it, and the boiled liquid immediately returned to the tube, the lamp was then withdrawn, and the brine soon ceased to boil, but the ebullition continued in the water for some time longer; it subsided at about 218° or 217°, but was constantly renewed by dropping in pieces of cedar wood. The brine was again placed over the lamp, and a test tube was plunged into it, containing a portion of water, together with a thermometer. The water in the tube did not begin to boil until the thermometer had risen to between 216° and 217°, when ebullition first commenced: the fragments of wood were then dropped in, and an usual very much increased the ebullition; and it was found that
the water, kept at this temperature, had its ebullition pro-
"moted or suspended, according to the presence or absence of
the extraneous bodies. Dr. Bostock concludes that in water
there is no difference of boiling point occasioned by the cir-
stances described amounts to 4° or 5°, but in other occasion-
ally to 50° or more.

The boiling point of water is also very materially altered by
the presence of saline matter; there is indeed no one salt
which affects it, but almost all the salts increase it by a
commonly each to a different degree. The following are a
few of the variations taken from the experiments of Mr.
Griffiths:

<table>
<thead>

</tbody>
</table>

In these experiments it is stated that dry salt was used, but
as it is not mentioned whether the salts were or were not ana-
lyzed, it is impossible to draw any very satisfactory in-
ferences as to the nature and quantity of the substance
producing the variation of temperature, except in a very
few cases; two of which may be remarked, as showing that the
increase of temperature is not in direct proportion to the
quantity of salt dissolved, and must therefore in some de-
gree depend upon its nature. Thus 30 parts of common
salt raise the boiling point 12°, while 50 parts of muriate of
ammonia raise it 24°, but if quantity alone produced the
effect, it should have required 60 parts of muriate of
ammonia.

The following are the boiling points of some substances,
which probably exhibit examples of the lowest and highest
temperatures at which ebullition takes place; the bodies
are considered as under the average atmospheric pressure:

BOIS-LE-DUC, a fortified town, the chief place of the province of North Brabant in the kingdom of Holland, 51° 42' N. lat., and 4° 10' E. long. The town was in 1184 by Godfrey III., Duke of Brabant, who possessed on the same spot a house in the middle of a forest in which he was accustomed to hunt, and hence the town has derived its name; Bois-le-Duc in the French, and a Hertogenbosch in the Dutch language, signifying the Duke's forest. Henry, the son and successor of Godfrey, caused the forest to be cut down, and surrounded the town with walls. In 1579 the town separated itself from the state, and was besieged both in 1601 and 1603 by Prince Maurice of Nassau. In 1629 it fell into the hands of the Dutch, and it was a siege of four months, which is spoken of as having been one of the most remarkable that occurred during the Eighty years' war. In 1672 it was attacked by the French, who were obliged to raise the siege in consequence of continual rains, which caused the inundation of the nearest lands by which the front was surrounded. An action was fought near Bois-le-Duc in September, 1794, between the English and French, in which the advantage was gained by the latter, and in the following month the place surrendered to the army under Gener. Fiechgru. The last occasion on which Bois-le-Duc was the scene of hostilities was in 1814, when, after being invested for several weeks, it surrendered to the Prussians under General Bulow. By a decree of Napoleon Bonaparte it was declared in 1810 to be united to the French empire.

Bois-le-Duc is situated near the confluence of the rivers
Dommel and Aa, the waters of which after their junction
receive the name of the Diest or Dieze, and flowing to the
north-east, one increases the remarkable form of the coun-
try. Bois-le-Duc is a clean and well-built town, about
five miles in circumference, and contains many good streets
and squares; it is intersected by canals, over which are up-
wards of eighty bridges. The town-hall, which stands in
the principal square, is a handsome building, resembling the
Stadt-house of Amsterdam, but on a smaller scale; it has a
steeple with a fine chime of bells. The town contains
six churches, four of which are appropriated to the service of
the Romanists, and two to the Reformed religion. St. John's
Church is one of the finest in the kingdom; its foundations
were laid in 1290, and it was not finished until 1312; its
roof is supported by 150 columns. During the reign of
Louis Bonaparte this church was taken (1810) from the
Protestants, by whom it had been held since 1639, and
given to the Catholics, who are very numerous in the town.
A citadel was built here in 1629 by Prince Frederick Henry
of Nassau under the direction of the states-general, in order
to keep the Catholics in check, and the name Papenbril was
given to it, a name which indicates its object and use.

According to statistical tables in the periodical work of the
Dutch government in 1829, the population of Bois-le-Duc in De-
ember, 1814, amounted to 13,071 souls. During twenty-five
years, from 1799 to 1814, the number of births was 11,589,
and of deaths 11,302, showing a rate of mortality of 1 in 27,
and a birth rate which indicates an unhealthy situation, and may prob-
ably be attributed to the marshy nature of the surrounding
region.

The town contains an academy of painting, sculpture, and
architecture, and a grammar-school, in which Erasmus and
Gressefeld were instructed in their studies.

Linens thread, ribbons, pins, needles, and cutlery, are
manufactured in Bois-le-Duc, which is favourably situated
for carrying on trade by means of the Diest, the Maese, and
the canal recently constructed from this town to Maas-
tricht, which gives it its name.

BOJADOR, CAPE, on the west coast of Africa, 26° 19' N.
lat., and 14° 10' W. long., forms one of the projecting
points of the Great Desert, or the Sahara. It rises to a
considerable height, and is the western extremity of a rocky
ridge, which is continued eastwards to the desert, and is
known to what distance. This ridge is called by the Moors
Jebal Khal, or the Black Mountain, according to Jackson.

The coast which extends northward to Cape Nun is one of
the most dangerous on the whole globe, being so flat, that
one may make a mile being in the water over the knees. Vessels consequently strike at a very
considerable distance from the beach. Besides, this low
coast is always enveloped in a hazy atmosphere, which ex-
tends for many miles out at sea. Jackson thinks that this
phenomenon is produced by the strong winds raising the
sand of which the numerous hills at some distance from the
shore are composed, and filling the air with it. But it must be
remarked that the phenomenon which is here observed
between the shore of the Sahara and the Canary Islands is
repeated more to the south, between Cape Verde and the
Cape Verde Islands, and his explanation is hardly admis-
sible in the latter instance. The danger caused by the
combination of such disadvantageous circumstances is still
alleged by the currents arising from the Straits of Gibraltar to Cape Blancato setting in towards the
land with great force and rapidity. The trade-winds also
which prevail in the Sahara, and generally in the sea to
the westward of the Canary Islands, rarely blow in the channel
which divides the land, and may be replaced by a westerly or north-westerly wind, from which
it will be evident that the dangers which here await the
unwary navigator are of no common description. It some-
times happens that a vessel strikes on the sands of this
coast when the captain looks towards the Great Canary or Tenerife; and we can hardly be surprised
that so many vessels are wrecked on a coast which is not
visited for the purpose of trade, except by a few fishing
barks from the Canaries. Jackson says that he knew of
thirty vessels, seventeen of them English, which had been
lost on it between 1790 and 1803; and he is inclined to think that their number was much greater, because most of them are quickly destroyed and never heard of. The unhappy sailors whose fate it is to cast away upon the shore fall into the hands of the Moors, and have to undergo the hardships of a most severe slavery in the desert.

The difficulties which oppose the progress of vessels near Cape Bojador was the reason why the Portuguese navigators in the beginning of the nineteenth century employed eighteen years in discovering the coast between Cape Nun and Cape Bojador. Though the former had been doubled in 1415, it was not till 1432 or 1433 that Gilanes succeeded in passing the mouth of the river. In 1439 the Portuguese built the fort of Bojador, as well as in the other Italian principalities of the time, on the spirit of feudal chivalry, although fast declining, was not altogether extinct. The laws, the duties, the customs, and courtesies of chivalry were studied as a science, in which Bojador, owing to his birth and rank, was early initiated, and he therefore could describe them with a feeling of consciousness and with a gravity which is not found in other romantic poets who did not enjoy the same advantages. Even among the flights of romantic hyperbole Bojador appears perfectly serious. His mind, stored with classical learning, was familiar with the conduct of epic narrative. The design of his poem is grand, the characters are well delineated, the various threads of his argument cross each other without confusion, but they are all left interrupted by the abrupt breakings off of the story. The first book was published in the third book, when the author was perhaps hardly arrived at the middle of his narrative. Bojador himself accounts for this interruption by alluding to the 'Gallic storm' which was then bursting upon Italy, and scared away his romantic muse.

Mentre chi c'è canto (cinque Dido dilettrice)
Veggio l'Italia tutta a favilla e a foco
Per via Galli, che con gran voce
Vengon per disertar non so chi loco;
Perché si fa in questo naso amaro?
Di Pio de' Pucci ad una a poco a poco;
Un'altra ruta, ma mi fa concerto.
Raccomando il mio lutto per un poco
(Last stanza of the last canto of the 'Innamorato'.)

Bojador was writing this towards the close of 1494, when Charles VIII., with a formidable army, had just invaded Italy and was marching to the conquest of Naples. He entered Florence in November, spreading confusion everywhere before him. On the 20th of the following December Bojador died at Reggio. The subject of his poem was afterwards resumed by Ariosto. [Ariosto.]

The first six cantos of the 'Innamorato,' were printed at Venice in 1495. In the next year they were again together with the nine cantos of the third book, which were all Bojador wrote, at Scandiano in 1495, under the direction of Count Camillo, his son. Several reprints were afterwards made at Venice and at Milan, all more or less incorrect. Nicolò degl'Agostini wrote a new version of the 'Innamorato' in three books, which however is very inferior to the original. In 1545 Lodovico Domenichi published an edition of Bojador's 'Innamorato' with many verbal and orthographical corrections. But before this, Berni had written his Ristampe of the 'Innamorato,' which was published in 1541-2, and obliterated the editions of the original poem of Bojador, the copies of which became very scarce, and the very name of Bojador was almost forgotten. The importance and success of unmerited neglect, a new and correct edition of Bojador's text of the 'Innamorato' has been lately made by Panizzi, with notes and a life of Bojador, London, 1831.

Bojador wrote also a sort of chronicle of the dark ages of Charlemagne and his successors, during the wars of the Normans and Saracens in South Italy, &c. 'Istoria Imperiale di Riccobaldo Ferrarese tradotta del Latino.' He called it a translation from Riccobaldi, a chronicler of the thirteenth century, but it is, in fact, a compilation, partly from Riccobaldi's work, originally in Latin, under the title 'Universalia,' and partly from other sources. Murratori, 'Rer. Ital. Scriptores,' has published both Riccobaldi's 'Pomarriun' and Bojador's 'Istoria Imperiale.' The latter contains many strange historical blunders and anachronisms, which serve to prove how inexact and crude Bojador's knowledge and experience was in Bojador's time, while they throw much light on those popular and confused traditions which gave rise to the stories contained in the romantic poems of Italy, and especially in the 'Innamorato.'
Mazzuchelli has published a medal in his collection, which was struck in honour of Bajoura in the year 1490, having his name on the obverse, and on the reverse a forgery of his name, assisted by Venus and Cupid, with the legend 'Amor vincit omnia.' (Museum Mazzuchellianum, tom. i. tab. 29.)

The castle of Scandiania, which still exists, though in a dilapidated condition, is now used as a storehouse for corn. The church of Bonjodoro was remarkably beautiful. (See Prolegomena to Bajoura's poem, Dr. Ferrario, Storia ed analisi degli antichi Romanzi di Cavalieria, &c., as well as Panizzi's edition and Life of Bajoura, already mentioned.)

BOKHARA, called also USBEKHISTAN, is a country situated between the Caspian Sea and the Bokhara desert, on the drier side of the Great Khanshan, on the north of the Black Sea and on the east of the Caspian Sea. Bokhara is a large and populous city, situated on the banks of the river Amu (Amoo-Daria), which is formed by the confluence of the rivers Vakist and Kizil. It is a town of considerable importance, being the capital of the province of Bokhara.

Bokhara forms the southern portion of that remarkable depression which extends northward to Saratow on the Volga in Southern Russia, and southward to the Hindoo Koom. The surface of this depression lies at a considerable distance from the sea, and is drained by the Amu and the Caspian. A large part of the area is low and marshy, and the mouth of the Amu is subject to overflow and inundation. The town of Bokhara lies on the right bank of the river, and its position is重要因素 in the trade of the province.

The climate of Bokhara is semi-arid, with a marked dry season from May to October. The summers are hot and humid, while the winters are cold. The town is subject to frequent earthquakes, and the earthquakes are accompanied by heavy rainfall. The town is also subject to occasional floods, which occur when the snow melts in the surrounding mountains.

The surrounding country is characterized by a rich agricultural land, and the town is famous for its fine wheat, cotton, and wool. The town is also a centre of trade, and is connected by rail with the Caspian Sea and with the interior of Central Asia. The town is a centre of trade and industry, and is celebrated for its silk industry.

The town is also a centre of trade and industry, and is celebrated for its silk industry. The town is also a centre of trade and industry, and is celebrated for its silk industry. The town is also a centre of trade and industry, and is celebrated for its silk industry. The town is also a centre of trade and industry, and is celebrated for its silk industry.
a crop the same season. Burnes says that 'south of the
Oxus the wheat yields a crop for three successive years.
When the wheat is gathered the cattle are turned in upon
the stubble fields, and in the ensuing year the same stalks
grow up to ear. The second crop is good, the next more
scanty, but it reaps a third time. The other grains which
are cultivated are barley and javelene (Holcus saccaratus).
As the climate is a quarter drier in the north, the barley
and the javelene are cultivated for that purpose. Of pulse,
peas, beans, and haricots are raised in great quantity.

Cotton, which forms one of the principal exports of this
country, is carefully cultivated everywhere. Hemp also is
raised, but not used as a dye, or for the manufacture of
dyestuffs; for this purpose the coloured species of the
dyeing-murex is used, yielding black, brown, and green
colours. The amount of cotton cultivated is said to be
sufficient to supply the wants of the whole country.

Cotton is raised in all parts of the empire, and the
produce is sold both to India and to the countries of
Eastern Europe. The cotton is ginned and the threads are
woven into gay, striped, and figured cloths of all kinds.

Tobacco is cultivated in many places; but of all the
kinds of tobacco the best is the native to the country of
Kurshie, which, according to Burnes, contains
10,000 inhabitants; and Karkool, to which Meyendorff
assigns 30,000 inhabitants, observing however that it is
smaller than the former. The best species of tobacco
is the Meeanka, but the rest are small, containing only
from 300 to 500 houses.

Bokhara, being situated between the two elevated table-lands of Asia, has frequently been invaded by the nations who inhabit the badlands and deserts, and the people of the
conquering nation has remained in the country and
settled there. At present eleven different nations may
easily be distinguished according to Meyendorff, namely
Uzbek, Tadjicks, Toorkmans, Arabs, Persians, Mongols
Kalmucks, Kirghis, and Kara-Kalpaks, Jews, Afghans,
Lesghis, and Gypsies.

The Uzbeks compose by far the greatest number of the
inhabitants. They are the last of the nations who have
subjected this country to their sway: they say that, before
the Tardirs, the country was inhabited by the ancient
tribes of Turks. The characteristics of their face are a
flattened nose, projecting cheek-bones, narrow eyes, which
frequently have a somewhat oblique position, and very little
beard. The Uzbek harems continue the entire life which the
whole nation led before their arrival in Bokhara; others are
employed as officers by government; and a few apply them-
selves to agriculture, commerce, or the mechanical arts.
These latter inhabit the large cities and their vicinity.

The Tadjicks are of the ancient Turco-Chinese races, the
aborigines of the country, and as the descendants of the
tribes of the ancient Sogd and Bactrians. Their body is stout and short, their complex-
ion florid, and in features they resemble the European.
The Tadjicks are very industrious. They cultivate the soil,
and apply themselves to agriculture, commerce, and all
the mechanical arts. The merchants who visit Orenburg
and the great fair of Nishni Novgorod are there called
Bokharans, but they are Tadjicks.

The Toorkmans, Kirghis, and Kara-Kalpaks belong to
the Turkish nation. The Toorkmans inhabit the desert
plain to the west of the Amou river, and acknowledge
their dependence on the khan of Bokhara only when it suits their
interests. The Kirghis and Kara-Kalpaks are few in
number, and live north of the Zar-afshan, and in the vicinity
of Kurshie.

The Arabs and Persians settled here at the time when
this country was subjected to the kaliphies of Bagdad.
Many of the latter have also been brought to this country as
slaves.

The Mongols and Kalmucks settled here at the time of
Tahengis Khan's conquest; some families also about 1770,
when the Tartug Mongols abandoned Russia and emigrated
to Sziigaria, or the Chinese province of Jihan Shan Pelu.
The few Afghans and Lesghis in Bokhara are said to be
the descendants of hostages which were brought here by
the famous Timur when he subjected their respective coun-
tries. Both in present speak their own languages.
The Jews and Gypsies have settled here voluntarily.

Meyendorff, who visited Bokhara in 1820-21, estimated
the whole population at nearly two millions and a half,
namely:—Uzbek, 1,500,000; Tadjicks, 650,000; Toork-

mams, 200,000; Arabs, 50,000; Persians, 40,000; Mongols, 20,000; Kirghis and Karakalpakas, 40,000; Jews, 4,000; Arabs, 400,000; gipsies, 2000; total, 2,475,000. He estimated the surface of the cultivated districts at about 6500 square miles, and thinks that they are inhabited by about one million and a half, so that those tribes who move to the nomadic life would amount to about one million. Burns however thinks that the whole population of the country can only be estimated at one million. It is easy to see that such estimates cannot be relied on.

The mechanical arts are not neglected in Bokhara, and so much moxa is made for home consumption, that" some kinds of cloth, in which both materials are combined, are in great demand in Russia for morning dresses of the rich nobility. The dye of all their manufactured goods is extracted from another plant which grows in the Stygian regions, and is the same that is used for tanning so well as the Russians, but they make excellent Marocco leather. Their swords are good, but much inferior to those of Persia.

The towns of Samarcand and Bokhara were some centuries ago famous as seats of learning, and were much resorted to by students from all the Mohammedan countries of Asia. At present the number of foreigners who live here for the sake of study is considerable: the madrasses, or colleges, are numerous, and though the instruction is not limited to the study of the Koran and its numerous commentators, and some metaphysical subtleties. After having acquired this stock of learning, the students become madruss or mullahs. But the lower classes of the people are not neglected than by the Mohammedan countries, and the greatest part of them can neither read nor write. The Tadjiks, who wish to employ their children in commerce, take greater care of their instruction than the other tribes. The children of rich people learn to read, write and recite the Koran by heart.

Two languages are spoken in Bokhara, the Persian and the Turkish, the former by the Tadjiks, the inhabitants of the towns, and the better instructed and richer portion of the Uzbecks. This language differs very little from that which is spoken in Persia, and the Turkish language is general, generally in the form of a parallellogram, two stories high, and enclosed a spacious court-yard. In each story are two rows of chambers, one having its windows and doors to the court-yard, and the other to the street. These chambers are divided into apartments, which are not only for living, but generally are repaired and sold, to a certain yearly maintenance from the college.

The number of public baths is eighteen. Several vaulted chambers are built about a large basin filled with warm water. The fuel is brought from the desert, and consists of small shrubs. Some of them are of large dimensions; generally between one and two, and some are square buildings of two stories, a court-yard in the middle, and two rows of chambers enclosing a court-yard. The rooms round the court-yard are used as warehouses, and let to the merchants. The bazaars are numerous and extensive, some of them being upwards of a quarter of a mile in length. In the shops with which they are lined on both sides, every sort of merchandise is exposed to sale, with the exception of woven goods, which are sold in large edifices built for that purpose. Several of them, consisting of some hundreds of small shops, contain goods of the same kind, and are usual about in the town, and others the cottons, linens, and brocades of India, Persia, England, and Russia.

The number of shops on the great square, or Segistan, is likewise considerable. Tents of different colours are filled with the more common manufactures of the country; but the greater part of the place is a market, in which the fruits of the country, consisting of grapes, melons of an extraordinary size, apricots, apples, peaches, pears, and melons, are sold; here likewise are exposed to sale the grain of the country, as rice, wheat, barley, barley, cotton, and so., in short all the necessaries of life. The active commerce which Bokhara carries on with all the neighbouring countries brings to this town the merchants of nearly all the nations of Asia. The town has a very considerable intercourse with Persians, Jews, Turks, Russians, Kirghiz, Chinese, Torkmangols, Mongols, Cosacks, Hindoos, and Afghans, besides the Tadjiks and the Uzbecks, the inhabitants of the town.
The Tadjiks compose by far the greater part of the inhabitants, amounting to three-fourths of the whole. They are merchants, manufacturers, and artists. The number of Jews and Hindoos settled at Bokhara is considerable, and there are a large number of stalls in the bazaar where they are employed to live happily. Though they are not permitted to build temples, to set up idols, or walk in procession, they live unmolested; and in all trials they have equal justice with the Mohammedans.

Taxes are levied on the commodities which are exported, and only a small duty on those which are imported, and these are only paid when the articles are sold. A Mohammedan merchant has only to swear by the name of the prophet and to declare himself poor, to be relieved from all duties. Justice is strictly administered according to the Koran.

Bokhara has for many centuries been a place of extensive commerce, and its geographical position must always ensure it considerable advantages in this respect. It is probable that the countries north of the Caspian Sea and the sea of Aral would be entirely debarr’d from any commercial intercourse by land with those of southern Asia by the great deserts that lie between them, were it not for the fertile oasis in which Bokhara is situated. The same deserts, and in addition to them impassable mountains, would prevent all immediate commerce between the table-land of Central Asia and that of Persia or Iran, had not the merchants of Bokhara devised means for traversing both with safety. Consequently we find that Bokhara is a centre of export and import between the large magnificient towns towards the north lead to Russia and the table-land of Central Asia, and three towards the south connect it with Persia, Afghanistan, and India.

The road which leads to the high table-land of Central Asia is from Charab to Ghurab, and from Ghurab to the Zarafshan to Samarcando, here passes the river, and then extends in a north-east direction through the desert to Oorturas, beyond which place it traverses the mountain-range which divides Bokhara from Khokand, and afterwards descends to the banks of the river. Along this road passes the town of Khoend and Khokand to Marghilan, and then in a south-eastern direction to Oush, from which place it leads over the mountain-pass of Terek to Koskoo and Khassaghar. The Bokharans talk to Khassaghar woolen cloth, coral, pearl, coccochineal, brocade, velvet, fur, especially of otters and martins, leather, sugar, large looking-glasses, copper, tin, needles, glass, and some iron utensils. They bring back in exchange a great quantity of inferior tea, china, sponges, knives, rubarb, and silver. This branch of commerce from 700 to 800 camels are employed.

Two roads lead to Russia, one on the east of the sea of Aral, and the other between it and the Caspian. The latter is shorter, and passes along the Amoo Deria to Khiva, and this road is the less crowded and less expensive. But this road can only be used when the Bokharans are at peace with the Khan of Khiva, and the Russians exercise a severe authority over the little horde of the Khirghiss, which inhabits the desert between the northern extremity of the sea of Aral and that of the Caspian. When the Bokharans fear being pilagged either by the inhabitants of Khiva or the Khirghiss, they take the other and longer road, which passes through the desert of the Great Horde of the Khirghiss, and afterwards runs to Orenbourg or Troisk. From these towns and others on the road to Khiva, cotton goods are exported to the fair of Nishnii Novgorod, where nine-tenths are sold. The Bokharans bring to Russia chiefly rubarb, raw cotton, cotton goods, skins of martins, lamb-skins, fox-skins, dry fruits, silken goods, especially for morning-dresses, carpets, and household goods of Cashmere and of Persia, and tea; they also take in exchange coccochineal, spices, sugar, tin, sandal-wood, woolen-loth, leather, wax, iron, copper, steel, small looking-glasses, otters, skins, pearls, Russian nankins, utensils of cast-iron, needles, coral, cotton-velvet, cotton-handkerchiefs, sponges, brocade, glass, and linen cloth, and small quantities of Indian muslins. They employ 3000 camels in this trade.

Three roads lead from Bokhara to Persia and Afghanistan, one to Meshed, the second to Herat, and the third to Cabool. The first passes in a southerly direction from Bokhara to the Amoo Deria, traverses in the same direction the Desht Kowon to Merve and Surah, and then passes off westward to Meshed. The road to Herat passes west of Kurseh to Kirkee on the Amoo Deria, and hence through the eastern and southern portion of the Desht Kowon to Andkhoo. At this place it turns west to Meimeona, passes the Moorgbaugh river, and traverses a mountain-range enters Herat. The Bokharans bring a variety of goods imported from Russia, and besides raw cotton, silk, gold, damasks of their own manufacture, woolens, spices, and rubarb; they take back the common shawls of Persia, used in Bokhara as turbans, girdles of a yellow colour, wooden combs, carpets, and taffetas. About 300 camels are employed annually in this branch of commerce.

The road to Cabool passes from Bokhara to Kurseh, and thence through a desert to the Amoo Deria, which it passes at Kiojusal. Hence it turns eastward, and passes through Khalkh and Khooloom, from which place it runs southward along the river Khooloom, till it enters the nether towns which extend to the neighbourhood of the town of Cabool. Before it reaches that town it traverses the valley of Ba-meene. This road and its continuation through Peshawur, Attock, and Lahore, connects Central Asia with India, but it is less frequented than the others on account of the unsettled state of Afghanistan, and the small authority which the sovereign of Cabool possesses among the mountaineers of this country. This commerce is entirely in the hands of the merchants of Cabool, and of the Hindoes of the Koochong and Shikarpore. They import shawls of Cashmere and Cabool, silkens brocade, fine muslins, pearls, and precious stones, and a great quantity of indigo; and export raw cotton, paper, iron, copper, glass, coccochineal, and some of the other cotton goods manufactured in the country. (Meyendorff and Burnes.)

BOLBEC, a town in France in the department of Seine Inferieure (Lower Seine) on the road between Le Hâvre and Rouen, 17 miles from the former, and 34 from the latter. It is 149’ 39’’ N. lat., 0’ 28’’ E. long.

Bolbec was not a place of any note in the early or middle ages. It was a dependency of the county of Eu, and was in the district of Caux. Expilly, in his Dictionnaire des villes, etc., &c., gives the population as 1,250 in 1770, and adds it is now 1,800. The town is an important mart in the trade, especially in leather and lace; he says there were also some manufacturers of woollen stuffs, and one of knives, which were in good repute on account of having been well tempered. In 1765 the town was almost entirely destroyed by fire; it was rebuilt and has since greatly improved, the improvement of the cotton manufacturing having been the great cause of its prosperity. "A few years since and Bolbec was only a poor little country town (‘una fabile bourgade’); it is now one of the most important manufactories in France. There is a poorhouse, and, so to speak, no poor at Bolbec, a town of 9000 inhabitants. 'This town,' says M. Carrier (and his observation deserves attention because he is sub-prefect), 'has no local tax on commodities (‘octroi’), yet it secures daily embellishment, because the population are not manufacturers, and the family regulates the municipal expenditure." (Dupin, Forces Productives et Commerciales de la France, Paris, 1827.)

Bolbec and the neighbouring town of Lillebonne were the first places in which machinery was applied to the spinning and weaving of cotton yarn. From near the commencement of the present century the inhabitants have been much engaged in this branch of business, and in weaving cheap and substantial fabrics of middling degrees of fineness, as well as in printing cottons. The following table, taken from M. Dupin, will show the activity of the district of which Bolbec is the centre:—

<table>
<thead>

18,200 £10,088,882 valuing the pound sterling, according to M. Balbi’s table, at 23.247 francs. To the productions of the industry of Bolbec there are added the cotton goods which are sent to Rouen to be decorated with red or blue, blue violet and white, and hands and ribbons. We know not whether its cutlery maintains its reputation for goodness.

The town is situated in a very picturesque valley, watered...
by the little river Bolbec, which flows into the Seine. It is a
handsome place, with a well-built parish church, said to
have been erected while the English were in possession of
Normandy. The situation is excellent, and its market
features draw their supplies of cotton (the raw material for
their manufactures) from Havre, their coal from the districts
of Fecamp and Harfleur. They find a market for their
productions in Rouen, the great mart for cotton goods;
while the port of Havre enables them to export all kinds of
admiralty goods, and to the wants of the colonies.
(Dupin; Robert; Dictionnaire Geographique; Reichard,

Descriptive Road Book, &c.) There is a considerable market
for horses. The population by the census of 1832 was 7063
for the town itself, or 963 for the city.

BOLBOLLA (Entomology), a genus of coleopterous
insects of the family Geotrupidae, Scarabeus of Linnaeus.
The species of this genus are remarkable for their short
compact form, above appearing almost spherical; the male
is armed with an erect horn springing from the head, the
female horn on the other side of the head. It has four
small horns, or tooth-like processes, arranged in a transverse
line on the anterior part; the antennae are eleven jointed,
the terminal joint of each is furnished with two teeth, the other is simple; the posterior portion of
the mentum is entire; the elytra are striated.

These insects live upon dung, and excavate cylindrical
cavities in the ground under the mass, in which they deposit
their eggs enclosed in a ball of the excrement.

There are about sixteen species known: their most common
colour is brown or yellowish, and sometimes black. In
this country two species have occurred, B. mohorica
and B. testacens. B. mohorica is of a pitch-black colour
and has the form of a cone; B. testacens is found in
the male sex has a recurved horn; antennae with the club
red; thorax punctured, and furnished with four tooth-like
projections on the fore part; elytra striated; legs and body
inclining to a red colour.

The Lemnian bole, called also Lemnian earth, was an-
tiently an article of materia medica, and kept by apothecaries
in small pieces under the name of terrae sigillatae: these
were impressed on one side with the figure of a goat, &c.
According to Pliny it is to be employed as an astrigent.
Klaproth found the composition of this bole to be

The only bole at present used is as a coarse red pigment,
for which purpose it is calcined and levigated, and vended
in Germany under the name of Berlin and English red.
(Akin's Dictionary of Chemistry.)

These earths were formerly employed as an astrigent,
absorbent, and tonic medicines. They might be slightly
serviceable as absorbents, in the same way as putty powder
is used in the potter's art; when sprinkled over excoriations
of the skin. Any tonic power which they possessed was due
to the oxide of iron, which is now administered in a purer
state. These once celebrated articles have fallen into
merited disuse: they are still however employed in the East,
and occasionally as veterinary medicines in Europe, where
of a kind are found abundantly among vol-
canic, basaltic, and the older calcarious rocks, and are
called after the different countries in which they are found.
Those which have less colour are called Bolus albus, are
procured in Bohemia, Salzburg, &c., and consist of lithi-
arge, which is formed of silica and alumina with water,
and a little oxide of iron. The bole Lemnian must not
be confounded with the lapis Armenius, which is a native
carbonate of copper. The terra Lemnia is sometimes em-
ployed to dignify the paws of the fruit of the Brandono
pomaria, the toad's or monkey-bread, which is used as an
astrigent for the cure of dysentery by the inhabitants of
Senegal.

BOLETIC ACID was first procured by Braconnot from
the boletus pseudo-ignarius by the following process: the
expressed juice was evaporated, and the wash of the
consistency of a syrup, and then treated with alcohol, which leaves a white
matter; this is to be washed with alcohol, then dissolved in
water, and precipitated with a solution of nitrate of lead; the
precipitate diffused through water is to be decomposed
by sulphuric acid and water gas; by evaporating the remain-
ing solution there are obtained impure crystals of boletic
acid, and a very acid mother-water, composed of fungic and
phosphoric acids. The crystals of boletic acid are redissolved
in alcohol, which leaves a calcaeous salt, and by evap-
orking the solution purer crystals of boletic acid are procured.

Boletic acid is colourless, crystallizes in four-sided prisms;
taste is acid, like that of bitartrate of potash; it reddens
litmus, does not alter by exposure to the air; it is gritty, like
sand, and is transparent to sight. It is soluble in water
at 68°, and in 45 parts of alcohol. By heat the greatest
part of it is sublimed either in prismatous crystals or in fine
powder; but towards the end of the operation some empy-
reumatic oil is formed, and there is a strong smell of acetic
acid. It has the power of forming, by the agency of the
peroxide of iron from solutions, but not the proteoxide.

This acid forms salts with the alkalies, earths, and with
metallic oxides; they are called boletates. They are not
important compounds, none of them being applied to
any use. (Berzelius, Travail de Chimie, tom. 5, p. 192.)
BOLETUS (Entomology), a genus of coleopterous insects of the section Brachylitra (Macleay), and family Tachyporide, Staphylinus of older authors. Generic characters: head long, and pointed anteriorly; antennae with the basal joint rather long and slender; the three next joints slender, and nearly of equal length, the remaining joints gradually increasing in width to the last, inclusive; palpi rather long and slender; thorax narrower before than behind, the hinder angles rounded; elytra smooth, or indistinctly striated; body long, widest at the base, and tapering to a point at the apex; legs moderate, tibiae spinose, the four posterior with long spines at their apices.

The species of this genus reside in boleti and fungini; in the latter they occur in the greatest abundance, particularly when in a state of decay. They are all exceedingly active, and their smooth slender bodies and pointed heads render it an easy task for them to thread their way with rapidity through the putrescent fungi.

B. lanatus (Linnæus) is one of the most beautiful and largest species of the genus, and is not uncommon; it is about a quarter of an inch long. The head is black; the antennae have the three basal joints yellow, the remaining black, with the exception of the terminal joint, which is yellow; the thorax and legs are yellow; the wing-cases are of a blue-black colour, with an oblique yellow spot on the shoulders; the body is yellow, with the apex black.

About eighteen species of this genus have been found in this country, almost all of which are variegated with yellow and black. Many have the wing-cases yellow, with two black spots, one on each side at the apex; some have also the region of the scutellum black. (Stephens's Illustrations of British Entomology.)

BOLETUS, an extensive genus of fungi, consisting, according to the old botanists, of leathery masses, which are sometimes of considerable thickness, and having the spores lodged in tubes which occupy the same situation as the plates in the gills (or hymenium) of the common mushroom. Fries, the great modern describer of fungi, defines the genus thus: hymenium formed of a peculiar substance, altogether distinct from the cap, entirely composed of tubes united into a porous layer; these tubes are unliod, separable from each other, long, cylindrical, or angular, open from end to end, and bear asci (spore-cases) on their inside; ascii cylindrical, with small roundish spores; the stipe is central, and often netted; the cap is fleshy, soft, spread out into a hemispherical form; veil present in many of them. It includes within its definition but a small number of the old Boleti, referring the principal part to Polyporus, which is specially characterized by having the tubes of its hymenium inseparable from the cap, which is more leathery, and usually without a stalk.

The true Boleti are generally found growing on the ground in woods and meadows, especially in pine woods; the Polypori are commonly met with on trees, birch, and poplars. Of the former several species are eatable, as B. edulis, subomentonius, and grandulatus; others are acrid and dangerous. Of the Polyporus, subsubcameraus, ovatus, and other similar others are inedible, etc., the upper part of the stalk called tuberaster, which has a great reputation at Naples and Genoa. S. Cinnabarinus, supposed to have been the agarkon of Dioscorides, is an old-fashioned medicine remarkable for the extreme acridity of its powder; it acts as a powerful purgative, but never employed as such in the present day. B. igniarius when dried and sliced furnishes the German tinner, or enameller, a leathery substance sold in the tobacconists' shops. B. destructor is one of the many species of fungi the ravages of which are too well known under the name of dry rot; their destructive influence is not however caused by the decomposition, or the part which we commonly consider the fungus itself, but by the ramifications, through the substance of the wood, of what botanists call the thallos and gardeners the sapum of such plants, which is in effect their stem and root in a mixed state. The most dangerous of the dry rots is Merulius lacrymans.

BOLETUS, MEDICAL USES OF. Several different species, all confounded under the name B. igniarius, furnished the means of staniching the flow of blood from wounds. The dried and powdered fungus possessed astringency, and, being erroneously referred to the genus Agaricus, were termed agaric, which word is often used as synonymous with styptic. Boletus possesses however no peculiar power of arresting the flow of blood, but acts mechanically like the sponge, absorbing the blood, and moreover being now almost entirely disused by British surgeons, but in some cases it merits a preference over other means of closing a bleeding vessel. When it is to be used, it must be rubbed firmly between the hands, doubled, and applied over the orifice with a gauze, and bound down by a compress. It should not be removed till after twenty-four hours, and the clot should be softened with cold, not warm water. Though the German tinner seems to offer a convenient substitute for the prepared agaric in case of an emergency, its brownish or blackish tincture in nitric acid is not however caused by the addition of nitric acid or salt petrificum in which it is steeped would irritate and influence the edges of the wound. (Amadou, vol. i. p. 410.) The German tinner however forms a very excellent moxa. The different kinds of boleti used as styptics were formerly dispersed over Europe.

It is less on account of their uses than of their peculiar habitations that the boleti merit our notice. In chemical composition, odour, and habitations, they resemble animals more than vegetables. When cut into, some of them exhibit almost a musk-like structure (B. hepaticus, or P. hepaticus), hence called by the French le musc de bœuf. The boletus igniarius, when divided, has been stated by Professor Eaton to heal like a flesh-wound by the first intention, or complete re-union of its divided edges, scarcely exhibiting a matrix in which to be the important for Jewish (Shahinian's Journal, vol. vi. p. 177).) Nitrogen enters into their composition; and in regard to their relations with the atmosphere, they inhale oxygen, and exhale carbonic acid gas. The boletus luridus has been ascertained to abstract twelve per cent. of oxygen from the air of the atmosphere in twelve hours. (Inqury into the Changes which the Atmosphere undergoes when in Contact with certain Vegetables which are destitute of Green Leaves, by M. F. Marcot; Jameson's Edin. New Phil. Journal, vol. vii. 1833.)

Boleti consist largely of fungus, with some boletic acid. Unlike most fungi, which grow rapidly and perish quickly, most of the boleti grow very slowly, acquire a firm texture, and last perhaps 100 years if not exposed to much moisture. According to Dr. C. D. Cameron, Igniarius is found in India, and used in nearly the same manner as in Europe. (Ainslie's Materia Medica India, vol. i. p. 6.)

BOLEYN, ANNE, or, more properly, BULLEN, or BULLEYNE, was the daughter of Sir Thomas Bollen, afterwards created Viscount Rochford and Heathfield. He was the representative of an ancient line in Norfolk, which had in three descents been allied to the noblest families in England; and he had himself filled important offices in the state. Anne's mother was Lady Elizabeth Howard, daughter of the Duke of Norfolk. Anne Boleyn was born in the year 1507, and in her childhood accompanied Mary, the sister of Henry VIII., to L 2
France, where she remained in the court of that queen and of her successor, the wife of Francis I, for many years. She was afterwards attached to the household of the Duchess of Alençon. The time of her return from France is doubtful, but it is believed to have been in 1528, when her husband was sent in an embassy to France. At that time she became a maid of honour to Queen Katharine, the wife of Henry VIII., and was receiving the addresses of Lord Percy, the eldest son of the Duke of Northumberland. Henry VIII. is to be credited, he had long entertained scruples concerning the lawfulness of his marriage with his brother's widow; and had attributed to this violation of God's law the premature death of all his children by Katharine, excepting the Duke of Mary. The most of these stories however cannot abstain from remarking that the moment of his proceeding openly to annul the marriage was identical with the commencement of his addresses to Anne Boleyn, and that a similar coincidence marks the catastrophe of the unlucky woman. A letter from the king to her in 1528 alludes to his having been one whole year stricken with the dart of love; and her engagement with Lord Percy was at this time broken off by the intervention of Wolsey, in whose household that nobleman was brought up. Anne retired into the country during the early part of Henry's process for the divorce, but she kept up a correspondence by letters with him. Some of the king's letters to her are still extant in the Library of the Vatican; they are in bad French, and were copied by the direction of Bishop Burnet, and afterwards printed. But Dr. Rowland Lee, afterwards bishop of Litchfield, performed the ceremony 'much about St. Paul's day,' which is probably the 25th of January, the feast of the conversion of St. Paul, or perhaps the 4th of January, another St. Paul's day. This date is established by a letter from Cranmer in the British Museum, quoted by Burnet, and printed in Ellis's Letters, first series, p. 34, and Cranmer's assurance is corroborated by that of Stow; although Hall, and after him Holinshed and Speed, mention St. Paul's. But the death of Henry's process was not until the 23rd of May following that the nullity of the king's previous marriage was declared by Cranmer, who five days afterwards confirmed that of Anne Boleyn; and on the 1st of June Queen Anne was crowned with great magnificence in the Tower. But the following September the Princess Elizabeth was born.

Of the events of the queen's life during the two subsequent years little is known, except that she favoured the Reformation, and promoted the translation of the Bible. In January, 1535, she brought forth a dead child, and it was at that time and during her previous pregnancy that the affections of her husband were alienated from her, and fixed upon Jane Seymour, daughter of Sir John Seymour, and one of the maids of honour to the queen. Whether it was by the wish of Henry, his, had he been in law, spreading concern Anne it is needless to inquire; nor is it very important to know by what device a despotic monarch, who could count upon corrupt judges and a parliament of incredible servility, clothed with the forms of law to carry out his wishes, and to house the queen in likewise criminal intercourse with her brother, Viscount Rochford; the evidence to support the charge proved that he had beant on her bed. She was accused also of grossly criminal intercourse with Henry Norris, grooms of the stool; Sir Francis Dereham, a gentleman of the bed-chamber; and Mark Smeaton, a groom of the chamber. To support these charges something said by Lady Wingfield before her death was adduced, which amounted only to this, that the queen had told each of these persons that she loved them better than her royal husband. She was sent into high treason, under the act of the 26th of Henry VIII., which made those who slandered the issue begotten between the king and Queen Anne guilty of that crime. The other evidence against her was Mark Smeaton, who was never confronted with her, but who was said to have confessed that he had three times known the queen. Two days after she was condemned to death Cranmer pronounced the nullity of the marriage in consequence of certain lawful impediments ostensibles by the king. Of her conduct in the Tower an exact account may be derived from the letters of Sir William Kingston, the lieutenant, of which five, together with one from Edward Seymour, Earl of Hertford, are printed in the originals in the British Museum. From the day of her committal she seems to have been certain of her fate; and she displayed by fits the anguish of despair and the levity which often accompanies it. 'For won owre,' says Kingston in a letter to Secretary Cromwell, 'she ys determined day to dy, and the next owre will contrary to that.' To her aunt the Lady Boleyn, she confessed that she had allowed somewhat too familiar approaches by her courtiers, but she never varied in her denial of any criminal act. On the 15th of May she was arraigned, together with her brother, in a special commission of which her uncle, the Duke of Norfolk, was president. The sitting of this commission was secret, and the record of its proceedings must have been immediately destroyed; it is certain however that none of the ladies of her household were examined. The tradition of all contemporary writers agrees that the queen, unassisted by legal advisers, defended herself firmly and skillfully, notwithstanding the indecent impatience of the president; but, according to the practice of that and the three subsequent reigns, she was of course convicted. After her conviction the feast of the queen's imprisonment is mentioned in baseness of her persecutors, and anxiety for her own posthumous fame. There is in the British Museum the copy of a letter, unquestionably authentic, addressed by her to the king, which is written in such a strain of consciousness of an imminent execution but without a winking of the eye, it sets her immesurably above her oppressor. She tells him, 'Neither did I at any time so forget myself in my exaltation, or received queenship, but that I always looked for such an alteration as I now find, for the ground of my predicament is not one or two princes, or any fancy, the least alteration was fit and sufficient I know to draw that fancy to some other subject. . . . Try me, good king, but let me have a lawful trial; and let not my sworn enemies sit as my accusers and judges; yea let me receive an open trial, for my truth shall fear no open shame.'

Sir William Kingston, with the aid of his wife, and of the Lady Boleyn (the queen's aunt and known enemy), acted as a constant spy on her; reporting to Secretary Cromwell, and through him in the king's interest to the prisonar's lips. On the 16th of May, Kingston writes impatiently to 'know the king's pleasure as shortly as may be, that we here may prepare for the same which is necessary for to do execution.' On the 18th he writes: 'And in the receiving of letters from Queen Anne there is no manner of question, for the queen comes to her own pleasure.' "Mr. Kingston, I hear say I shall not die afore noon, and I am very sorry therefore, for I thought to be dead by this time and past my pain." I told her it should be no pain, it was so suble. And then she said, 'I heard say the executioner was very good, and I have a little neck,' and put her hands about it, laughing heartily.' On the 19th of May she was executed on the green before the Tower, denying her guilt, but speaking charitably of the king, no doubt with a view to protect her daughter from his vengeance. 'Her body was burnt within in the Tower, not being used to put arrows in.' Lord Rochford, Norris, Weston, Brereton, and Smeaton were also put to death.

A living historian sees something mysterious in the hatred exhibited by Henry to his queen. The mystery is sufficiently solved when we learn that the murder of the queen's execution Henry married Jane Seymour; and he afterwards procured an act of parliament (28 Hen. VIII. c. 7) declaring his marriage with Anne void, and the issue of it and of his former marriage illegitimate.
VIII. could only obtain her hand by annulling his previous marriage; and the refusal of the pope to do this led to the secession of England from the Romish communion. Thus it is that the character of Anne Boleyn (a matter utterly beside the questions agitated between the Catholic and Protestant churches) has become a subject of fierce controversy which three centuries of unceasing strife have heightened. Catholic writers strive elaborate to prove that, after a courtship of more than five years, her charity did not repel the advances of Henry up to the very day of her marriage; while Protestants indignantly deny the charge, and appeal in their vindication to the dates of the principal events of her life.

Burnet, who has taken great pains with the subject, is the writer on whom we have principally relied. Stow, Hall, and the other historians who wrote in the time of Henry VIII. and of Queen Elizabeth, are cautiously meagre in their details.

BOLINGBROKE, HENRY ST. JOHN, VISCOUNT, was the son of Sir Henry St. John, Bart., afterwards Viscount St. John of Battersea, who was born October 1st, 1675. His mother was Mary, daughter of Robert Rich, Earl of Warwick. He was sent to school at Eton, from which he proceeded to Christ Church, Oxford; and on leaving the university he appears to have gone to travel on the Continent. He is supposed to have been abroad during the greater part of his post, and it is clear from the date that he visited Milan. In 1700, soon after his return, he married Frances, daughter and one of the co-heiresses of Sir Henry Winchcomb, by which alliance he came into the possession of considerable property. His wife and he bore the name of Rich, his father-in-law.

He had before this produced a few short poetical pieces of little merit; but he was chiefly known as one of the most dissipated among the young men of fashion of the day. He now however entered upon a new scene. He was returned to the parliament which met in February, 1701, for Watton Basset, a family borough, from which his father retired to make room for him. At this time the Tories, with Rochester and Godolphin at their head, were in power; and to this party, which was also dominant in the new House of Commons, of which he was a member, he at first appeared to be attached; indeed, even in this his first session, to have distinguished himself on various occasions as one of the most active and efficient members of their body. Their leader Harley, whom they had placed in the chair, and St. John were already intimate friends.

He sat also in the next parliament, which met in December of the same year, the last called by King William, and in the first held by Queen Anne, which assembled in October, 1702. On Harley being made secretary of state in 1706, and becoming first lord of the treasury, St. John was appointed his secretary, and thus came into power. However, after nearly four years, till February, 1708, when, upon the formation of a Whig administration under Marlborough and Godolphin (who had by this time changed their politics) he and Harley were cut out, the Whigs were in power.

He did not seek a place in the next parliament, which met in November, 1708; but, retiring to the country, withdrew altogether from politics, and gave himself up for two years to study. By the end of this period another composition revolution had taken place, and the dismissal of Godolphin in the beginning of August, 1710, had again elevated the Tories to power, with Harley at their head. In this new arrangement St. John was made one of the secretaries of state, and the most important office of the direction of elections. He was returned both for his old borough of Watton Basset and for the county of Berks, for which latter he elected to sit.

The biography of St. John for the next four years forms a principal part of the memorable administration of which he was one of the leading members. That administration remained at the head of affairs till it was suddenly upset by the death of the queen in the beginning of August, 1714. During its tenure of power it had terminated the peace of Utrecht (signed 11th April, 1713) the war with France, which had lasted since 1702; and this forms the great public act by which it has left the mark of its existence behind it upon the history both of these kingdoms and of Europe. In the negotiations by which this event was brought about, St. John bore not only an eminent but the chief part. There is much reason for doubting however if the restoration of peace was the ultimate or principal object of his zealous exertions. There is indeed strong ground for believing not only that both he and Harley, almost from their first entrance upon office, contemplated the restoration of the Stuart family to the throne, if circumstances should prove favourable for such an attempt, or if their own interests should appear to demand the measure, but that they had at least acted with a view to the perpetuation of the Pretender. He had been called to the House of Lords by the title of Viscount Bolingbroke in July, 1712; and soon after this, from various causes, an estrangement and rivalry arose between him and his old friend Harley (now Earl of Oxford and lord treasurer), which broke out at last in an open contest for ascendency. Principally, as it is understood, through the aid of Lady Masham, by whose influence with her royal mistress Harley had been placed in his present situation, but who in the end deserted herself and Bolingbroke, the latter was the more likely to effect the removal of his competitor on the 27th of July, 1714.

The death of the queen, however, which followed within a week, and the prompt and decisive measures taken at the instant by the friends of the House of Hanover, made Bolingbroke's triumph only that of a moment. After having been treated by the Lords Justices in a manner which sufficiently showed what he had to expect, he was on the 8th of August by the king's order dismissed from the council and in the House of Lords. After this, and even appeared in parliament, and took an active part in debate, as if he had nothing to fear; but alarmed at length by the temper shown by the new House of Commons, which had commenced its sittings on the 4th of March, 1715, on the 26th of the same month he suddenly left London in disguise, and succeeded in making his escape to France. On the 9th of August following, by order of the Commons, he was impeached by Walpole at the bar of the House of Lords of high treason and other charges; but he made use of every facility the French government afforded him to render himself to take his trial, he was attainted by act of parliament on the 10th of September. In the meantime he had entered into the service of the Pretender, who appointed him his secretary of state, or prime minister, and in June of the following year, did in fact take up his residence in the aid of the French government to the expedition then preparation with the object of effecting a rising in favour of the exiled family in Great Britain. When the prince set out in person for Scotland at the end of the year, Bolingbroke was left in charge of the troops which had occupied the town of St. James's, and a negotiation was opened with him by Lord Stair, the English ambassador in Paris, with the view of making arrangements for his pardon and restoration to his court connexion; but it seems he might now be able to render against the party and the court by which he had just been flung off. It is probably however that more was expected of him in this way than he was disposed to engage for; at any rate the ministry eventually declined granting the pardon for the prince.

He remained in exile for the next seven years, during which he kept up a correspondence with Swift, Pope, and other literary friends in England, and also drew around him a circle of new acquaintances comprising some of the most brilliant and noble minds of the age. He was principally on a small property called La Source, near Orleans, which he had purchased in 1719, in which he had taken great delight in laying out and decorating. His wife having died in November, 1718, in May, 1720, he privately married his former secretary, the lady who had been his wife for some time previously. She was a niece of Madame de Maintenon, and brought him a considerable fortune. It was to this lady's exertions and management that he was eventually indebted for liberty to return to his own country, which he obtained in May, 1723, principally it is understood through the intervention of the king's mistress, the Duchess of Kendal, whom Lady Bolingbroke bribed with a sum of eleven thousand pounds. Bolingbroke however, although he came over for a short time in June of the same year, did not take up his residence in England till September, 1724. He now petitioned for the restoration of his property, and that also was granted to
him by an act of parliament, which received the royal assent on the 31st of May, 1725. The complete reversal of his attitude, and also the exclusion of the House of Lords, was steadily refused to all his solicitation. Upon finding the doors of parliament thus shut against him, he engaged in a course of active opposition to the ministry through the medium of the press; and his political writings, prefixed to the title of "Letters upon the History of England," and afterwords in the "Craufurman," excited for some years much attention. It was in the "Craufurman" that the series of papers from his pen originally appeared which were afterwards collected and published separately under the title of "Letters upon the History of England," by Humphrey Oldcastle, and also the subsequent series of letters forming his "Dissertation upon Parties." 

While thus employed he resided at the villa of Dawley, near the place, which he had purchased on his return. Here he occupied himself not only in carrying on this political war, but, as it afterwards appeared, in writing various treatises upon moral and metaphysical subjects which he did not send to the press. In January, 1735, however, he suddenly left England, and returned to France, with the resolution of spending the remainder of his life in that country. This step is supposed to have been connected with some political reasons, but what they were has never been satisfactorily explained. In this year, as appears from the "History of England," the 4th Edition of which was published in London an octavo pamphlet containing a correspondence of some length which had taken place between Bolingbroke and the secretary of the Pretender's service in 1716. The sender apparently quitted England with a letter at large; and their contents are such as it certainly could not have been agreeable to Bolingbroke to see laid before the public. He remained in France, residing at a seat called Chanteloup, with the exception of a short visit which he paid to England to dispose of Dawley, till the death of his father in 1742. He now returned to take possession of the family estate at Battersea; where he resided for the most part till his death on the 15th of December, 1771. He left behind him, by whom he had no family, terminated a union which seems to the last to have been one of great happiness and strong affection on both sides. Most of his old friends also, both literary and political, among the number Pope, Swift, Gay, and Atterbury, were now gone. In politics he had almost ceased to take any active part for some years before his death; the fall of Walpole, in 1742, the event to which he had looked for so many years for his full restoration to the rights of citizenship, and probably his readmission to public life, when it came, brought no advantage either to himself or his party. Bolingbroke bequeathed all his manuscripts, with liberty to print them, to David Mallet, the poet and Scotchman, who had gained distinction by consequence of his recently deceased friend Pope, who, shortly before his death, had, without the knowledge of the author, got an impression of the work thrown off from the manuscript which had been lent to him. Mallet published the several treatises which had thus been left to him, along with all Bolingbroke's correspondence preserved in 4to in 1754. The first volume of this collection contains the "Letter to Sir William Windham" (which had been first published in 1732 along with some other pieces); a short tract, entitled "Reflections upon Exile" (dated 1716, and first published in 1724); the "Dissertation upon the Study and Use of History," though part of it had, it is stated, been shortly before printed in French in a "Monthly Mercury;" several short political papers, some originally published under the title of the "Occasional Writer," and others which had appeared in the "Craufurman;" and the "Remarks on the History of England," in twenty-four letters (originally published in the "Craufurman," and afterwards published separately under the name of Humphrey Oldcastle, with a dedication to Sir Robert Walpole, and a preface, which are here omitted, as having been "written by another and a very inferior hand.") The contents of the second volume are "A Dissertation upon Parties" (in nineteen letters, originally published in the "Craufurman," and also in the "Correspondence of Bolingbroke and Madame de Stael," dated 1735, and first published in 1732, in 2 vols. 8vo, although a portion of the work had been privately printed in the lifetime of the author; a "Plan for a General History of Europe," and a "Letter on the Pretender," prefixed to the "History of England," and called the "Dissertation upon the Study and Use of History." Volume third consists of "A Letter on the Spirit of Patriotism" (dated 1736); "The Idea of a Patriot King" (dated 1738); "A Letter on the State of Parties at the Accession of George I.;" "Some Reflections on the Present State of the Nation" (published in 1745, and first published in 1759 along with the Letter to Windham); the "Substance of some Letters (on moral and metaphysical subjects) written originally in French, about 1720, to M. de Pouilly;" and "A Letter concerning the Nature, Extent, and Influence of Roman Knaveism," also written originally in French, and published along with the Letter to Windham, being the introduction to the series of letters or essays addressed to Alexander Pope, Esq. The fourth volume contains the second of these essays, entitled "On the Folly and Presumption of Philosophers;" the third, "On the Rise and Progress of Monotheism;" and the fourth, "Concerning Authority in Matters of Religion." The fifth volume is made up of fragments and minutes of essays, in continuation of the above. In 1798 there appeared in 2 vols. 4to, sometimes designated State of the Nation; and in 1798, also, in 4 vols. 8vo, a "Collection of the Letters and Correspondence of Bolingbroke. Public and Private," during the time he was Secretary of State to Queen Anne, with Explanatory Notes, &c., by Gilbert Parke, of Wadham College, Oxford. The ninth volume, "Selections from the Letters," when Bolingbroke took flight for France, by his under-secretary, Thomas Hare, Esq. afterwards Sir Thomas Hare, Bart. of Stow Hall, in Norfolk, where they had ever since been preserved, their existence having been little noticed or known. They appeared as a collection of letters by Bolingbroke, in French, edited by General Grimard, who has prefixed an historical essay on the life of the writer. This collection consists for the most part of letters written in French by Bolingbroke to Madame Stael, from 1712 to 1726. These letters, besides being valuable between 1718 and 1726. An octavo volume of letters, addressed by Bolingbroke to the Right Hon. William Pitt (the first Lord Chatham), is said to have been printed at Dublin in 1758, but we have not seen it. Lord Bolingbroke's writings are now little read, and indeed, in matter at least, they contain very little for which they are worth reading. He had no accurate or profound knowledge of any kind, and his reasonings and reflections, though they may have often a certain speciousness, have rarely much solidity. A violent man by nature, we believe, he was, when he was young, a considerate one, he even has in what he has written on the transactions of his own time, and on those in which he was himself concerned, only perplexed and obscure history; and this seems to have been his career. His most important performances of this kind, though they somewhat contain what he was parried immediately after the events to which they relate, and although in one or two instances a very few copies of them may have been privately printed and confided to certain intimate friends, a few years after have been actually composed by their author from the public or by himself lived to be called to account for what they contained, or any of the persons who could best have either refuted or confirmed them. As a mere rhetorician, however, Lord Bolingbroke was a very great master. There is, in that style, even if he be ever allowed, though he added little if anything of much value to the general intelligence from his own stores, to have for the first time familiarized some important truths to the public mind. His style was a happy medium between the love of the man of society—or rather it was a happy combination of the best qualities of both, heightening the ease, freedom, fluency, and liveliness of elegant conversation with many of the deeper and richer tones of the eloquence of formal orations and of books. The example he thus set has probably produced a considerable effect in moulding the style of popular writing since his time. The opposition of Bolingbroke's philosophical sentiments, as disclosed in those writings which appeared after his death, to revealed religion, is generally known, as well as the severe remark which the manner of their publication drew from Johnson—"Having loaded a blunderous
and pointed it against Christianity, he had not the courage
to discharge it himself, but left half-a-crown to a hungry
Sorbonne student, to the great rejoicing of all. We, as we
believe, admitted on all hands that Christianity has not
found a very formidable opponent in Bolingbroke, and
that his objections for the most part only betray his own half-
learning. His objections, and the system which he would sub-
stitute for them, have been very minutely examined by one of
the third of his 'Letters on the Study of History,' and in his
's Essais' addressed to Pope.

BOLITTO/PHAGUS, Fabricius (Entomology) Eldedona
of Latreille, Leach, and Millard, and Opiparum of some
other authors; a globular insect of the section
Heteromezia and family Tenebrionidae. The principal
generic characters are as follows: head short, partially
hid en by the thorax, in the males sometimes armed with
a horn or tubercle; antenna very short and thick, the
third segment having the usual form of a club; maxillary
palp rather large and distinct, the terminal joint
truncated, its length equaling that of the two preceding
joints; labial palp small; thorax coarsely punctured or
rugose, the lateral margins more or less toothed; elytra
deply striated; legs short and thick, the anterior tibiae
compressed.

There are about six species of this genus known: they
live in boleti, and are of a small size, a short ovate form, and
their prevailing colours are brown-black. In this century
both Bolivar and O'Donovan collected this genus, and their
discussions under the name Agaricicola. It is of a brown colour, and about one-twelfth
of an inch long. It is rather local, but where it does occur
it is found in tolerable abundance.

BOLIVAR, SIMON. In giving a sketch of the life of
this great man of the 19th century, it is necessary to select facts
that have most probability can be appreciated only by those who
have examined and collated the conflicting accounts of
different partisans, which exhibit, on the one hand, the
extravagant praises of friends, and on the other, the violence
of partisans and pan-hispanism in its extreme form. The pre-
cent article is derived from several works which, as they
will occasionally be referred to, it will be convenient in
the first place to name. The most important are, The Annual
Register; The American Annual Register; The North
American Register; the report of the Comité de la
Revolución de la República de Colombia, by José Manuel
Restrepo, Paris, 1827: this work is dedicated to Bolivar,
as the intimate friend of the author, who was secretary
of the Colombian republic. Outline of the Revolution
in Spanish America, by a South American; Mémoires of
General Miller, in the Service of the Republic of Peru, 2 vols.,
London, 1829; Journeys in Colombia, by Captain Cochran,
2 vols., London, 1828; A Memoir of Colonel Bolivar in El Menaz-
gro, by the Rev. Jos. Blanco White, Londres, 1823; Me-
moires de Simon Bolivar were published in Paris in 2 vols.,
1829, a sight of which we have not been able to obtain.
The discrepancy of the various accounts in these works
is occasionally very perplexing. Indeed Bolivar himself, as
General Miller asserts, declared in 1824 that all the nume-
rous stories about him were false. In this eulogy, it is
necessary to premise, that, in some of the following partic-
ulars, especially the dates, it is not unlikely that inaccuracy
may be discovered by persons whose information has been
acquired on better authority than that of the inconsistent
narratives hitherto published. It is much to be regretted
that no impartial history of the South American war of
independence has yet appeared.

Simon Bolivar was born in the city of Caracas, on
the 24th of, or, according to General Miller, the 25th of July,
1783; a date established by his own biographers. As a
colonel in the militia of the vale of Aragua, his mother
Doña Maria Concepcion Palacios y Sojo; both of very
populous families in Venezuela, of the rank of nobility called
Los Montufulas. He was sent, when about fourteen, to
Mexico, where he made an excellent education. Some
of his biographers it is said that in his voyage he visited
Mexico and Havanna, places lying certainly somewhat out
of the way of a ship's passage from Venezuela to Spain.
After remaining several years in Madrid, and paying some
attention to the study of jurisprudence, he made the tour of
Italy, Switzerland, Germany, England, and France; and
after a long residence at Paris, devoting his time, as some
writers believe, to the study of jurisprudence, in 1807, he
entered the diplomatic service of Spain, and was despatched to
others, reveling in all the licentiousness of the Palais
Royal—he returned in 1808 to Madrid, and there married
the daughter of Don Torro, uncle of the Marquis of Tore
of Caracas, or, in other words, the Marquis of the Marquis
of Ustor de Oro, his age being then only under sixteen
and that of his wife, who is described as being remark-
ably beautiful and accomplished. In 1809 he returned to
his native country, where, in company with the new captain-
general, Don Emilian, he arrived March 24th at the port of La
Guaya, and retired with his wife to domestic seclusion on one of his large patrimonial estates
in the beautiful vale of Aragua near Caracas. The yellow
fever, so prevalent in that climate, soon terminated his
peaceful domestic happiness. He and his wife were both
sick and died. The natural intensity of his affection
threw him into a state of frantic grief, which he sought to
alleviate by returning to Europe. From Europe he pro-
ceeded to the United States, where he gathered some useful
political knowledge, and about the beginning of 1810 again
landed in Venezuela, in company with General Miranda,
and retired to his estate of San Mateo.

It may be useful here to say a few words in explanation of
the state of things immediately previous to the entrance of
Bolivar upon the scene. It will be recollected that the
colonies of South America appear to have remained during
a period of about 300 years in quiet submission to the
arbitrary government of the mother country; that is, from
the time of Columbus to the commencement of the pres-
etional history of the South American revolution. The
political conditions of South America from the first
by the revolution of the Anglo-American colonies, and
afterwards by that of France, began to be earnestly dis-
cussed by the patriots of the southern continent, who, in
aggravated circumstances of oppression, far exceeded the
south of the Iberian peninsula, the political condition of
their respective countries. It was from among the indisci-

date official clerks, were sent from Madrid, and without
being, in reality, under any responsibility, revelled in every
kind of tyranny and venality. Justice was bought and
sold: the most important legal decisions were made in
favour of the highest bidder. The mercantile policy of the
parent country was equally despotic and rapacious; to
preserve her monopoly of the wine trade, the culture of
the vine in America, though very appropriate to the climate,
was strictly prohibited; the establishment of manufactur-
nges became objects of speculation. All corn and other
products of Spanish city shops, were forced, in barter for bullion,
upon a half-civilized people who neither wanted nor could
possibly use them; foreign commerce was interdicted
on pain of death; all social improvement was suppressed; and
prevented them from knowing the great and beneficent
invention, all intercourse whatever was strictly forbidden with
any country or people besides Spain and Spaniards, and
allowed even with them only under many restrictions. In
short every species of wrong appears to have been inficted,
with the exception, above all, at what has been called the
mediation of the United States. The North American and
their ranks were reinforced by recruits from the lowest and worst
description of monks in the monasteries of Spain. By them
supersition and ignorance were upheld as the surest support
of the policy of the Spanish colonial system; so that before
1810, throughout the whole continent, between Lima and
Monte Video, there was but one crazy old printing-press, and
that in the hands of the monks, who consigned to the
dungeons of the Inquisition every possessor of a disallowed
book. (Quarterly Review, vol. vii., and North American Re-
view. vol. x.) It is impossible to state anything more
than briefly of the first revolutionary movement in Venezuela a spirit of
inquiry was aroused by a secret importation of the works of
the French writers on religious toleration and democracy, the 'Rights of Man,' and similar productions; and that
was the greater danger of which they were jealous. The
slanderous and pernicious denunciations of the priesthood, so strongly stimulated the
desire to read them, that many individuals retired to seclu-
sion in the country for that purpose. However, before 1810,
the disposition to shake off the tyranny of Spain had already
become sufficiently strong to occasion a few desperate
B O L
80

attempts; but terror soon quelled these partial efforts, after
those concerns were destroyed by the cruellest kinds of
death. The first decisive movement of the revolutionists
was made on a solemn Catholic festival, on the day preceding
the Feast of the Assumption, August Thursday, 1810, when the
commander-in-chief of Caracas was arrested and deposed, and
a supreme junta or congress assembled to organize a new
government for the state of Venezuela. (See in Outline of
the Revolution, the Declaration of Independence, on the
28th of the following month, July or August, the same was done
at Bogota, the capital of New Granada, which formed for
itself a separate republican government; but it does not
appear at all certain that Bolivar had any share in these
first insurrections, though it is possible he may have induced
in others his own determination. On the contrary it seems to be evident
that he at first regarded the project as impracticable; or, as
some assert, he disapproved of the plans then adopted by the revolutionists,
who still partially retained a reliance on the unfortunate Ferdinand,
for, after the establishment of the independent legis-
lature at Caracas, he does not appear to have held any ap-
pointment, though imported to do so by some of its mem-
bers, especially by his cousin, Don Felix Ribas.

He accepted, however, soon after the proposition to proceed to
England, for the purpose of soliciting the English government to aid the cause of the independent party, and,
with Don Luis Mendez, arrived in London in June, 1810.
Finding that the English government professed to maintain a strict neutrality, Bolivar himself paid an
official visit, after a short stay in England, left his com-
panion, and returned in disgust to Caracas. Upon
the appearance of Miranda as commander-in-chief of the
patriot army in 1811, the declaration of independence was
boldly maintained by the military forces which were
in the city of Caracas, La Guayra, and Merida, about 20,000
persons; and it happened on the very day and hour in
which the revolution had broken out two years before, the
clergy seized upon the accident to benefit by a powerful
excuse. The clergy of Caracas, the priests, monks, and friars were
stationed in the streets, vociferating in the midst of credu-
lous multitudes trembling with fear, while the royalist troops under Monteverde were getting possession of the provinces. In 1809 there were 7000 royalist
prisoners of war, who were confined in the fortress of Puerto
Cabello, having shortly after broken loose, murdered some
garrison, and by the treachery of the officer on guard,
taken possession of the citadel, Bolivar, being unable to
regain his prison by destroying the gateway, had to
destroy the bridge by fire and treachery, and the night
on the 1st of July, 1812, returned by sea to his estate near Caracas.

General Miranda, on learning at Vitoria that this very important place, with all its stores of ammuni-
tion and provisions, was deserted, capitulated in despair to Monteverde the royalist general, and prepared to
leave the country, when he was unexpectedly arrested by
a party of patriot leaders, of whom one was Bolivar himself;
by him Miranda was accused of being a traitor and secretly
allied with the British, and being delivered with
nightmares, his soldiers were put in irons to Spain, where he
died in a dungeon. For this conduct Bolivar and his compatriots have been severely repro-
ached with treachery and ingratitude. There were how-
ever many circumstances which appear to justify a suspicion
of Miranda’s collusion with the English Cabinet. He had
been long resident in London, was in constant intercourse with the English
officers stationed at the neighbouring islands, and was
about to depart in the vessel of an English captain. He had
denied, indeed, any attempt of intrigue, but the defect of
natives and preference of foreigners. Bolivar received from
Monteverde, as an especial favour, a passport to Caracas,
where, with his cousin Ribas, he remained during the
autumn of 1812. Venezuela was now again entirely in the
hands of the royalists, and death and plunder reduced the whole country to a frightful state of misery:
by pretexts the most trivial, old men, women, and
children were arrested, maimed, and massacred as rebels. According to General Holstein, friars and military butchers
reigned triumphant; and one of Monteverde’s officers, Co-
lonelSusostes, cut off the ears of a great number of patriots,
and had them in his soldiers’ caps for cockades. It
is, therefore, not strange that at this time Bolivar became
a more enthusiastic adherent to the patriot side; and,
with his cousin Ribas, proceeded from the island of
Curacao to Cartagena, in order to raise a liberating army.
There, by the influence of Manuel Torrices, the republican
candidate, he was appointed, in December, to the
chair of the Junta at Cartagena, which he held until
the 8th of January, 1813, when Bolivar, as commander-in-chief,
and Ribas as major-general, undertook to drive the Spanish
royalists from Tenefer, on the river Magdelana. Having
arrived at Tenerife, on December 27th, and defended
the attack of the Spanish, Bolivar suffered a loss of
depth; in January, 1813, to Ocaña, and in February to Cu-
ciu, whence he expelled the Spanish commander Correa,
and attracted great notice by surrounding every difficulty,
dispersing the enemy, and gaining several hundred volun-
teers, provosts, and money. With this encouragement he
planned an expedition for the relief of Venezuela, after
proceeding to Bogota, where the congress of New Granada
received him well, and added largely to his means. By con-
tinual recruits from the towns through which he passed, his
army increased to more than 2000, whom he marched along
the Andes by Tunja and Pamplona, entered Venezuela,
defeated the royalists at Grita, Merida, and various other
places, and took possession of the whole province of
Varinas. Castillo, who in slow and cautious formality was
destiny in Cartagena, denounced as rashness and madness
his precipitate decision to engage in the danger of
and daring expedients. He therefore separated and led away
his troops to Tunja near Bogota: but the whole country
rising and joining the ranks of Bolivar he was enabled
to drive the royalists to warm. Ribas led one division, himself the
other, and both, by forced marches, advanced rapidly on
La Guayra. The revolutionary spirit was, previous to this time, confined to very few:
but the most incredible cruelties of the officers of Monteverde
and driven thousands to desperations and revenge; and
hence arose, on the part of the people, the cry of
guerra de muerte, war to death. In justice to Bolivar, it
is requisite to relate the circumstances which occasioned this
dreadful expedition. A detachment under Colonel Brema
was master of prisoners; Don Tucar, the governor of
Varinas, caused the Colonel, with sixteen of his com-
pagnions and several patriot citizens, to be deliberately
shot. This, in addition to numerous similar instances, and
report that the patriots showed mercy to prisoners and
suffered vengeance, by which the wavering and
timid were induced to proceed. The only solution determined him to proclaim that ‘the executioners who en-
title themselves our enemies, have beheaded thousands of
our brethren: our fathers, children, friends they have buried
in the dungeons and vales of our country: they have
immolated the unoffending commanding Popayan, with all their captive companions:
they have perpetrated in Varinas a horrid butchery of our
fellowsoldiers made prisoners of war, and of many peaceful
citizens: these victims shall be avenged—the executioners shall
be exterminated—our country compels us to a mortal
struggle—they shall disappear from America—the war
shall be unto death!’ The date of this manifesto is Me-
rida, June 8th, 1913. It is said by General Holstein, that
the liberation of the city of Caracas, the capital of Venezuela. The joy
of the people exceeded all bounds: it was certainly the most
gratifying event in Bolivar’s military career. Greeted by
shouting thousands, artillery, bells rang, and music, they
drew into the city in a triumphal car by twelve beau-
tiful young ladies of the first families of Caracas, dressed
in white, and adorned with the patriot colours; while
others offered flowers on their way with flowers.
All the prisons were thrown open, and hundreds held
as pale and emaciated to thank them for their liberation.
The royalists throughout the province capitulated, and the triumph
was complete. Even General Holstein, the bitter enemy of
Bolivar, acknowledged the fact, ‘he deserves great
pardon for his perseverance, and for the high
conception he entertained, in which he sacrificed a considerable part of his
fortunes to furnish the troops with the means of following him.’
Marino, who had recently raised an army in Cumanas, and
from whom the royalist general escaped only by being caught in the armed and carried off upon the horse of a brawny Capuchin who was fighting at his side, had assumed the name of Ribas and was going to furnish the Eastern provinces of Venezuela. The same title was adopted by Bolivar for those of the West. At this time he was in possession of unlimited power; but he did not prevent the prevalence of popular dissatisfaction, which the conduct of his officers had excited, and of discontent among the combatants. He suspected that no royalist should in any way be injured, still, an arbitrary and burdensome military government, necessary perhaps to correct the effects of previous anarchy, induced many to emigrate to the neighbouring islands for the sake of greater security. The legislative, executive, and judicial powers being united in the person of the dictator, occasioned great offence to the democratic party, and suspicions arose that the primary object of the liberator was his own aggrandisement. A consciousness of this opinion induced him, in the congress assembled at Caracas, Jan. 1, 1814, to declare, 'I have consented to accept and keep the supreme power to save you from anarchy; citizens, I am not the sovereign; your representatives will give you laws; the revenues of the government are not the property of those who govern. Judge now yourselves if I have sought to elevate myself; if I have not sacrificed my life to constitute you a nation: I desire that you will permit me to resign the office I hold: my only request is that you will leave me the honour of combating your enemies.' His retention of the office was occasioned by his science, as well as for a genuine enthusiasm still prevalent in his favour, in consequence of the nobilities beginning again to rally their forces and arm the negro slaves: a desperate expedient by which they were much assisted in raising a numerous army.

At Anzoategui and other places the patriots were surprised, and all put to the sword. The royalist generals Boves, Rosette, and Morales, in committing the greatest cruelties, and destroying even women and children, appeared to emulate the ferocity of the first invaders. The first two, throughout a march of 400 miles, from the Orinoco to Ocumare, killed and murdered every individual who refused to join them; and General Puy, a negro assassin and robber, having on two occasions arrested and murdered hundreds of the patriot inhabitants of Varinas, Bolivar, in revenge, and for the sake, it is said, of freeing the enemy from the repetition of such atrocities, ordered about 800 Spaniards in La Guaya and Caracas, to be arrested and shot, which accordingly, on the 14th February, 1814, was done, and immediately retaliated by the royalists, who shot several hundreds of patriot prisoners, whom they had taken in the field. It was the recorded instance of the patriot army's resorting to the savage expedient so continually practised by the royalist commanders; and afterwards, at Ocumare, in July, 1816, it was formally proclaimed by Bolivar that 'no Spaniard shall ever pass through my country, a distance of 60 miles, unless he shall cease.' After several sanguinary conflicts, in which the patriots were victorious, Bolivar was beaten on the 14th of June, 1814, at La Puerta, between Cura and S. Juan Los Morros, where he lost 1500 men, in consequence of over-confidence, and the audaciousness of his army: again, on the 17th of August, at his estate of San Mateo, where 'the infernal division' of Boves, a legion of negro cavalry with black crepe on their lances, rushing with hideous shouts from an ambush, scattered his remaining forces, and, but for the timely intervention of Buendia, the royalist general, his cousin Ribas was seized and shot, and his head was stuck on the wall of Caracas. Bolivar's beautiful family mansion was burnt to the ground, and he was ultimately compelled, in September, to leave the Spanish generals and the liberating army, in possession of all the provinces of Venezuela; when thousands of the patriot army deserted to their ranks. The two dictators, Bolivar and Marino, repaired as fugitives to Carthagena. They were received with great respect by the republican congress of New Granada, then assembled at Tunja. They fixed their capital in a small town about sixty miles north of Bogota. Bolivar was commissioned to compel the revolted province of Cundinamarca to join that republic. With 2000 men he marched, in December, 1814, upon the city of Bogota, which after a short siege, and an attempt at a surprise, was stmulated, and became the seat of congress. He was then employed to attack the fortified town of Santa Martha, which, in consequence of the imbecility of Labuta, the governor, had fallen into the hands of the royalists. But the governor of Carthagena, Colonel Castillo, who had formerly withdrawn from Bolivar's command, having renewed his attachment and been placed at his head, with the determination, manifested, of poisoning the neighbouring valley, and keeping the troops of Bolivar, in respectment of this conduct, were engaged in reducing Carthagena; when, in April, 1815, in the midst of this unfortunate civil strife, which occasioned the total wreck of the hopes of the revolutionists, and the undisguised announcement of General Morillo from Spain, with an army of 12,000 Spaniards. The peace of 1814 with France had enabled the Spanish government to make a vigorous effort to regain the revolted colonies. Bolivar, disgusted with the civil war and persecution of his friends, retired in May, 1815, to Jamaica, leaving Morillo to over-run the whole country. It appears that, being in despair of his country's ability at that moment to make any successful resistance, he determined to wait for a time more favourable. During his absence Morillo continued to ravage the two republics with fire and sword: at Bogota 500 inhabitants, and at Zinuiti, a town sixty miles south of that city, 1500 were shot and hanged. While at Kingston in Jamaica, Bolivar employed himself in writing a defence of his conduct in the civil war of New Granada, and issued several spirited exhortations to the patriots, for which his absence was at first supposed to be a result. He was feted by the royalist party; and the Spaniard who undertook it for the reward of 50,000 dollars and perfect absolution, employed a negro who stabbed to the back of the author, and thereby caused his assassination. Bolivar's assassin was shot in a hut, and in the amok in which he usually slept. The island of Hayti became his next asylum. By the president Petion he was supplied with four negro battalions, in addition to a body of several hundred patriot emigrants; and in May, 1816, was enabled, in conjunction with the British, to execute the same number of the republican naval forces, to land in the island of Maraga, where General Arismendi had again assembled the independent forces. With these various recruits, in July, he appeared in Cumaná, where he was suddenly surrounded by five thousand royalists, and defeated with great slaughter. At Caracas, after he had taken and burnt the town, he delivered the treasurers to death, and that no one should be injured for having deserted to the royalist ranks. He now took ship to the Dutch island of Buen Ayre, and thence proceeded to Hayti. In the following December he reappeared in Margarita, whence, having issued a proclamation convoking the patriots of Venezuela to a general congress, he sailed to Barcelona and collected a force sufficient to repel Morillo, then advancing upon him with a powerful army. A battle of three days ended in the defeat and disorderly flight of the Spanish army. The royalist general defeated by the ferocious Llaneros of General Paz. Bolivar, being now again recognized as supreme chief and captain-general, fixed his headquarters, in 1817, at Angostura, on the Orinoco. With an army of 5000, half infantry, he marched thence to the westward with great success, and took possession of the province of Calabozo, where Morillo was collecting his forces. After numerous and obstinate battles, which are individually too important to be named in the present outline, the republican party obtained a decided superiority; being greatly assisted by some foreign mercenary volunteers, of whom there were at this time in Venezuela about 3000 from Holland, Ireland, and England. On the 16th February, 1819, a solemn installation of the congress of the Venezuelan Republic was made at Angostura, which has also the name of Boqueron. It was translated and published at the time in London, and may be found reprinted in the appendix to the memoirs of Gen. Miller; it is an excellent specimen of that impassioned and lofty eloquence in which his ardent temperament and peroration kindled up. The language is fully adapted by the stately phraseology of the Spanish language is so well adapted: indeed, much of the turgid extravagance of Bolivar's style, for which he is censured, is attributable to the idiom of his mother tongue, which abounds in hyperbole. But, however, he was not altogether unreservedly penetrated by the philanthropy and good sense of most of his moral and political opinions; for instance, 'popular education ought to be the first concern of the congress; morals and knowledge are the cardinal points of republican prosperity.' The devoted earnestness in which, at all times, Bolivar urged the importance of moral and mental reform, can be appreciated only by reflecting upon the profligacy and barbarous
ignorance of his countrymen. The strange combination of democratic and monarchical principles must astonish every one who follows the progress of Bolivar's government, which on the one hand asserts the social equality and universal brotherhood of man, and on the other so solemnly and fervently advises the adoption of a government system, in which the sovereign power is centralised in a single person. This principle has created much distrust of Bolivar's republican principles; but the moral condition of his countrymen, and the state of exploded factions, may well be allowed to account for the recommendation of a strong government, without resorting to the uncharitable term of tyranny designates for those that inexorable necessity alone could have imposed upon me the terrible and dangerous charge of supreme chief: I feel to breathe again in returning to you this authority, which I have endeavoured to maintain in the midst of distracting confusions, and amidst the trials of society. His authority as supreme chief, though resigned into the hands of the congress, was continued to him under the title of President, until the more violent commotions of society should subside, and the enemy be utterly expelled. In the same year he marched to the assistance of General Santander, in New Granada, and in July arrived at Tunja, which, after a daring and well-planned engagement on the neighbouring heights of the Andes, he took from the royalists; and, on the 7th of August, a decisive victory at Bogotá, in addition to several other victories, drove himself, and the New Granada. Sananano, the viceroy reinstated by Morillo, precipitately fled; and Bolivar entered Bogota in triumph, amid the most joyful acclamations of the inhabitants, who hailed him as their liberator; the congress appointed him president, in general of the army, and supplied him with money, men, and munitions, sufficient to ensure the complete expulsion of the Spanish troops. At Angostura, during his absence, the popularity of General Arismendi had gained him many adherents, and occasioned, in his encampment at Caracas, the formation of a party in encouraged suspicions of Bolivar's ultimate object. Intelligence of this dissension had no sooner reached Bogota, than Bolivar, apprehensive of the ruinous consequence of disunion, hurried away with 3000 chosen soldiers, and by his presence in that encampment, the threatened insurrection was stopped. His entry into the city, a magnificent triumph, and Arismendi was sent into exile. A general congress from the provinces of Caracas, in New Granada, summoned, and December 17, 1819, the decree was passed by which these two republics were united under the name of Colombia: the province of Quito, which was liberated by the great victory of General Sucre on the 24th of May, 1822, at Pichincha, on the borders of the Andes, received the title of Republic of Quito. It was still deemed expedient, for the sake of security to the southern frontier of New Granada, to deprive the Spaniards of their possessions in Peru, and General San Martin, the founder of Peruvian independence, having solicited the aid of Bolivar, and engaged him, at the instance of the administration of government to the vice-president, General Santander, and putting himself at the head of the Colombian army at Popayan, marched to Pasto, thence to Guayquil, where, on the 25th of July, 1822, he had an interview with San Martin, and, after the conclusion of a treaty, was authorised to take the head of the conquest. On the 13th of November, 1823, by a congress from the provinces of Northern, or Lower Peru, of which Lima is the capital. Bolivar, in the following December, marched from Lima with 5000 Colombians, to Pativilca and Huaura.

The congress, unable to govern, in February, 1824, dissolved itself, and appointed him dictator; 'an act,' says Gen. Miller, 'of unquestionable wisdom, when the country could be saved from party insurrection and the national enemy only by the energy and promptitude of military dictation.' An army of 10,000 men was despatched to the province of Callao in sending her army into Peru, had designs of territorial aggrandisement, and that Bolivar was actuated solely by sinister views of ambition. San Martin had been similarly treated, and having said in his address of September 20th, 1819, 'If the truth be known, I am but a scion of my own family, and not the son of a sovereign,' retired to Europe. The reply of Bolivar was, 'Your chiefs, your internal enemies, have calumniated Colombia, her brave men, and myself. The congress has confided to me the odious office of dictator; but I declare that the army must be governed by its own laws, and my own will shall cease—that you shall be governed by your own laws, and your own magistrates, and that, in returning with my fellow-soldiers to Colombia, I will leave to you perfect liberty, and not take away from Peru even a grain of her sand. His army, consisting now of 5000 Colombians under Gen. Sucre, and 4000 Peruvians under Gen. Miller, landed on July from Huara to Paseo. In a tedious passage of the Andes, the greatest hardships and dangers were endured, and by no one with greater fortitude than Bolivar: the cavalry having sometimes to stand throughout the night upon the snow-covered precipices and mountains, and at other times up to their saddles. After this victory the main army was left under Sucre and Miller; and Bolivar with a detachment proceeded to Lima; where, on the 22nd of December, he summoned a congress which re-organised the government. He next proceeded to Pichincha, and, by the acknowledgment of his services, urged the acceptance of a million of dollars, which he refused, with the assurance that the honour of receiving their confidence was the only reward he desired. Before the senate, on the opening of this session of congress, he declared, 'I was told that all Europe and America knew the horror I feel at irresponsible power, under what name soever it is exercised.' In the mean time the Generals Sucre and Miller, on the 9th of December, won the great victory of Ayacucho, when the royalists were completely defeated. In the following May ended the revolutionary war of the Spanish American colonies, in which, for the possession of national independence, at least 100,000 lives were sacrificed. On 10th February, 1825, the congress was again convoked by Bolivar, who resigned his power, and the Constitution of 1823 was adopted. As far as being delivered from that which, of all things on earth, is most dreadful—war, by the victory of Ayacucho—and despotism, by this new revolution.' He set out in company with Generals Sucre and Miller, on the 10th of the following
April, to visit the provinces of Southern, or Upper Peru; drew his headquarters at Arequipa, Cuero, La Paz, and Potoi. The whole expedition was in a state of excitement and extravagant exultation; of dinners, balls, bull-fights, illuminations, triumphal arches, and processions. A sumptuous banquet was given on the top of the far-famed Cerro de Potosi, and the liberator, in the enthusiasm excited, approached the tribune and said on that occasion, 'The value of all the riches that are buried in the Andes beneath my feet is nothing compared to the glory of having borne the standard of independence from the sultry banks of the Orinoco, to fix it on the vast expanse of the ocean, where tiene and his companions have excited the envy and astonishment of the world.'

After a month of festivity at Potosi (see vol. ii. of Miller), Bolivar, with his military retinue, moved to Chuquisaca, the capital of these provinces, which had recently become dependent on his name. His personal protection of the convention of representatives here visited with each other in rhetorical resolutions of gratitude to Bolivar and Sucre, whom they designated 'Grand Prince and Valiant Duke,' and having assumed for their country the name of Bolivia, they appointed Bolivar perpetual protector, and requested him to prepare for them a plan of government. A million of dollars were offered to him, which he accepted, on the condition that they should be appropriated to the purchase and liberation of 1,000 negro slaves in Bolivia. In January, 1827, Bolivar addressed the following letter in May, the famous Bolivian code was presented to the congress of Bolivia. A transcript of the whole is given in the appendix of the Memoirs of General Miller, and various structures upon it may be found in the American and English press. In the year 1822, the Bolivian code was '32nd of June, the great congress of deputies from Colombia, Peru, Bolivia, Mexico, and Guatemala convened at Panama. The idea of this 'Grand Amphictyonic Council' arose first in the mind of Bolivar, which often concerned public questions as a matter of policy. The line of code in view was the annual assemblage of state representatives to discuss diplomatic affairs, and decide international disputes; promote liberal principles, and ensure an union of strength in repelling any foreign attack. In the first and only instance of its kind, the code was of little importance, in the philanthropic commendation of political liberality, religious toleration, and the abolition of slavery. The code of Bolivar was adopted in Bolivia, though without partial dissatisfaction, on the 9th of December, 1826, the anniversary of the battle of Ayacucho, and General Sucre was appointed president. It was soon afterwards adopted by the congress of Lima, where Bolivar himself was made the president. The prominent principle of this constitution is the appointment of a president for life. In the first instance, no law was passed by the Bolivian congress. In the case of Bolivar, he was considered that the society over which he was to preside, was breaking loose from a despotism of 300 years; and that the excessive ignorance of the great mass of the people required at first, in order to be restrained from anarchy and civil war, a government in which all power was vested in the president. He should also not be overlooked, that a clause of the code provided for its future alteration, when the progress of events should require it. But the suspicion of a people just liberated from anarchy and civil war, a government in which all power was vested in the president, and that unworthy designs of usurpation. Universal alarm was excited, especially as the large bodies of Colombian troops, though unemployed, were still retained in Peru, of which Bolivar now was absolute governor for life, in virtue of his own act, and in consequence, as it was said, of intrigue and intimidation.

In Colombia, his long absence had occasioned the prevalence of much dissatisfaction and party strife. General Paez, who, with his numerous cavalry of wild Llaneros, had done much for the patriot cause, had excited in Venezuela an insurrection in favour of a federal instead of the existing central government. Another portion of the republic was on the point of breaking up into separate states, each of which had in formation of a state of rebellion, that was daily increasing, and blood was beginning to flow. The presence of the liberator being thus demanded in the north, he departed from Lima, still leaving in Peru his Colombian protectorate, and to Bolivar it was necessary to give the extraordinary powers which are authorized by the constitution in cases of rebellion; but, at the same time, he proposed to reduce the army from 40,000 to 6000; to diminish the number of civil officers; to reduce the annual expenditure from 14,000,000 to 3,000,000, and to turn the ships of war. In a very impassioned address, he exclaimed, 'Colombians! I am among you—let the scandal of your violence, and the crime of your disunion cease at once. There is but one to blame—I am he—have too long delayed; but I have not done so to the appearance of Bolivar. There was still a charm in his name, and he was thought to be the only man who could save the republic from ruin. Paez himself issued a proclamation from Valencia, calling upon the people to receive him as the thrity earth receives the fertilizing dew of heaven.' In the end of December, the liberator arrived at Puerto Cabello, where he met General Paez; but instead of imposing any punishment for his rebellion, he confirmed him in his command in Venezuela, and issued a proclamation calling on the army to submit to the authority of the government, and that was readily taken to be a proof of his having himself instigated the insurrection, in order to furnish a pretext for assuming the power of dictator. An elaborate discussion of the particulars of this affair may be found in the 16th year of the North American Review. In his address, Bolivar said that Paez, in exciting insurrectionary tumults, was in deep collision with Bolivar; that the introduction of a monarchy was anxiously intended, and that the lenity and even rewards of Bolivar constitute proof of the plot; but it is actually pursuing the course of its last valiant general. The project was a prudent one, to conciliate the good rather than to irritate the ferocity of a man whose great authority over hordes of savage Llaneros enabled him, as an enemy, to produce the greatest mischief. However this may be, on the 25th of January, 1827, General Bolivar died, and the code was soon passed. In February, 1827, he addressed to the senate a letter, in which he states that 'suspensions of tyrannous usurpation rest upon my name, and disturb the hearts of Colombians. Republicans, jealous of their liberties, regard me with a secret dread. I desire to free my fellow-countrymen from all inquietude, and therefore I renounce, again and again, the presidency of the republic, and entreat the congress to make me only a private citizen.' The discussion of this matter was prolonged by the collision of party groups in the congress; in one of these, which was a conflict of faction, and ended in the exclusion of members not to accept the resignation, and Bolivar was consequently induced to retain his office. Still a very great mistrust of his assurances continued to prevail; and twenty-four members of the congress had voted for the acceptance of his resignation. In the meantime the Colombian troops in Peru being informed that Bolivar was making arrangements for the adoption of his code in Colombia, promoted a violent insurrection; for though it appears they were satisfied that Peru should adopt it, they would not permit its adoption in Colombia. Bolivar considered the remarks of his government, and that the insurrection was being equally dissatisfied with their new institutions, on the 26th of January, 1827, a complete revolution ensued in the governments of Lima and Bolivia; so that the code of Bolivar was rejected only six weeks after its adoption. Another congress that the conduct of Bolivar, which had been so justly praised, was in fact an unworthy design of usurpation. Universal alarm was excited, especially as the large bodies of Colombian troops, though unemployed, were still retained in Peru, of which Bolivar now was absolute governor for life, in virtue of his own act, and in consequence, as it was said, of intrigue and intimidation.
This extraordinary man, it would now appear, was a disinterested patriot, and had consequently been basely requited. In the course of his life, he had heard of many deaths, which occurred under circumstances very affecting, his merits as usual have been discovered by the riddle whom he served; and honours are paid to his memory, which, to his living person, were ungratefully denied.

In reviewing the career of Bolivar, the ever-creasing apprehension of the dangers of anarchy will serve to account for much of his inclination to recommend the exercise of absolute power as a means to an end, which even his enemies allow to have been good. The question is, what was the object for which he desired the possession of power? It appears to have been the reduction of conflicting parties to a unity of purpose in establishing republican government. His denunciation of slavery, the liberation of all his patrimonial slaves, nearly a thousand in number, the sacrifice of the whole of his large fortune in this cause of independence, and the generous rewards he bestowed upon its defenders, as well as his liberal views on popular education, cannot leave a doubt of his ultimate object having been the political freedom and moral reformation of his country. It is common to make comparison between Bolivar and Washington; but, in justice to Bolivar, the great difference of circumstances ought to be regarded in forming an estimate of their comparative merits. The liberator of Colombia and Peru had almost every possible disadvantage: he received neither the powerful aid of Frenchmen, nor the territorial assistance of France; every thing depended upon his own vigour in the suggestion of means. Further, it is impossible to imagine two nations more completely dissimilar in physical and moral character than the Spanish and English colonies at the time of their respective independence; the one freebooters and pirates, half-starved, half-starved, frugal and industrious, with a general equality of property and education; but the countries of Bolivar, one-half Spanish Creoles more or less mixed with the aboriginal race, the other half Indians, Africans, and intermediate colours, separated and conflicting masses, equally destitute of education, in their ignorance and indolent habits—a few in possession of immense wealth, even 100,000l. a year, and thousands in a state of mendicity and hunger. The army of Washington, independent of his foreign allies, was composed of local appraisers, each individual having a small estate, or less to return to: that of Bolivar often consisted chiefly of destitute adventurers, eager only for pay and plunder; ragged creoles, Indians, naked negroes, and cavalry of Llaneros and Guerrillas mounted on wild horses. The desertions were whole regiments at a time; while the other, according to the momentary chance of success, sufficiently shows their degraded moral condition. The generals, too, with whom his command was divided, were practically the most uncivilized description: Ariosto was as headstrong as a bull-hunter, nor readers of the Llaneros out of the deserts; and General Bermuda always took the field in a dirty blanket, with a hole in the centre for his head: while envoys and fierce ambition were common to them all. The character and habits of such a people and of such an army greatly enhanced the merit of the individual who conducts them from an abject state of oppression to independence and social improvement. The task undertaken and completed by Bolivar was the expulsion of Spanish authority, and the secure establishment of republican institutions; but the duty of a man as a military commander rather than as a statesman that his excellence consists. In enterprising promptitude and enthusiasm he differed greatly from Washington, and that he was qualified to succeed under circumstances essentially different from those which the North American general was placed. His invincible perseverance in spite of every discouragement and disaster, his ingenuity in devising expedients and raising resources, his command of the sword, being upon wavering minds, a domination in the final result; the manner in which he controlled the spirit of faction, and kept together conflicting interests until the termination of the struggle, entitle him to the reputation of a great man. His passive virtues were remarkably great in the endurances of fatigue, in marching often of more than a thousand miles, in the torrid heat and desert wilds of the Llanos, and over the frozen summits of the Andes, in hardships and dangers of every description, his fortitude for nearly twenty years is worthy of the highest admiration. Of the sincerity of his pa-
triotsim it is impossible to doubt. His generosity to the
benefactors of his country was unbounded. An instance may
be quoted from the report of the extraordinary educator
Joseph Lanzeri, who visited Colombia for the
purpose of introducing his system of elementary instruction.
It is preserved in the 26th volume of the Revue Encyclopé-
dique, dated Lima, March, 1855, and addressed to the
teacher, in which he wrote: "A million dollars, and promising
to procure the appropriation of a million more, besides a large contribution of his own for the
purpose of establishing schools, the liberator concludes with
"Receive the expression of my admiration, respect, and
gratitude, in the name of my countrymen and fellow citizens, for your good example and
your immense liberality." The text is written in Spanish and
translated to English.

The 10th volume of the same work is consulted for an
exposition of the progress of social and mental improvement in Colombia during the first five years of the republican government. It is written by the General
González, the Secretary of Education. The text is written in Spanish and
translated to English.

For those who desire to read the history of Bolivar's
campaigns, the map of Colombia in the work of Captain
Cochrane may be named as useful for reference, being
constructed on a comprehensive scale. A fine portrait of Bolivar, painted by a Tochima artist, requires only five
minutes for a glance. There is also an excellent one in the 'The Gallery of Portraits' of the Society for the Diffusion of Useful
Knowledge.

The expression of Bolivar's features was that of anxiety
and care. In the extreme gravity of his face, the
expression of his labours had given
him, at the age of forty-five, the appearance of sixty. In
height he was five feet five inches; his complexion dark,
and approaching to olive; his hair black and stiff, like that of
the American Indians, but inclined to curl; and his eye,
when he was in conversation, remained clear and bright.
He was capable of enduring great fatigue, was a
remarkably bold horseman, and excessively fond of dancing
in his boots and spurs. He entertained in the most munific
ent style, but was himself extremely abstemious. He
participated in the festivities on the occasion of the
fiftieth anniversary of the independence of Peru, and generous
and appropriate extempore replies. On one occasion he
delivered seventeen unpremeditated answers in suc-
eccession, each of which if printed off as he spoke it would have
been admired for its peculiar adaptation to the occa-
sion. In proposing a toast, in returning thanks, or in
speaking impromptu upon any given subject, General Bolivar was probably never surprised.

BOLIVIA is the name adopted by one of the new
republces which have lately been formed in South America. It
embraces the greater part of the territory which the vicerey of the
vicerey of Buenos Ayres or de la Plata; but being separated from the more populous parts of Buenos Ayres by the desert of Chaco, and a very rugged and dreary mountain-region, it was not likely that it could remain
 united to that State after the subversion of the Spanish
authority. The republic of Bolivia dates from the battle of
Ayacucho, Dec. 9, 1824, in which the republicans under
Sucre completely defeated the royalists. The patriots
adopted for their new republic the name of Bolivia, in honor of
Bolivar.

The northern angle of Bolivia is the peninsula
formed by the confluence of the rivers Beni and Mamore,
in about 9° S. lat., from which point the united river is
called Madera. The most southern point is on the shores
of the Pacific, at the Bahía de Nuestra Sehora, between
Punta del Norte and Punta del Sur, about 25° S. lat.
It consequently extends over 16° of lat., or upwards of
a thousand miles, from north to south. The most eastern
part is contiguous to the river Paraguay, where after leaving the Vicerey of Peru it separates the boundary between Bolivia and Paraguay, and extends to 57° 30' W. long.
The western portion of the republic borders on the
Pacific at Punta del Norte, about 70° 30' W. long. Under
the parallel of 22° the extent of the country from east to west
is about 4000 miles, having a breadth of 1600 miles, but
the mean length 700, which gives a surface of 350,000 square
miles, or about three times the extent of the British Islands.
Bolivia is bounded on the west for about 260 miles by the
Pacific Ocean; the remainder of its western and north-
western frontier is formed by the republic of Peru. It
borders on the north-east and east on the empire of Brazil,
and on the south and south-west on the republic of the
Aragon to the south of it extends the republic of Buenos
Arenes, and where it approaches the Pacific, that of Chili.
As nearly the whole of this country is situated within
the tropics, it might be expected that its climate and pro-
taminations were warm and healthy; but perhaps not more than one-half of its surface has a
tropical climate. The other half is occupied by high
mountain-ranges, table-lands of great elevation, high val-
leys, and widely extending slopes. This mountainous
portion of B. m. m., with great ranges of east and
west, and 1000 or 2000 feet in altitude, extend from the
Rio Bermejo from those of the Pilco-

When the Andes running from south to north enter Bolivia they send off at about 24° N. lat. a lateral branch
to the east, which extends to a great distance, and separates
the affluents of the Rio Bermejo from those of the Pilco-

The principal channel of the Andes here runs nearly south
and north, and is likewise little known, but contains some
peaks which rise above the snow line. The Nevado del
Chiquillo (21° 30' S. lat.) is said to rise to 16,548 feet,
but is probably higher. Up this mountain the Andes seem
to make a sudden dip, leaving the Andean Cordillera to the
extremity of Chili; but to the north of it at about 20° there is
an extensive mountain-knot, called the Cordillera de los
Lipiz (19° 30' S. lat.); the mountains divide into two great
longitudinal ridges, which run parallel to one another and
form an immense mountain-scale, forming a central gap in the valley of Desaguadero, which includes the great lake of
Titicaca. The western ridge, called the Western Cordillera,
continues, as far as it lies within the boundaries of Bolivia, a
due northishore, and contains near the boundary-lin
certain passes, as the Caran Tirma, the Tarma, and the
Gualati, rises to 22,000 feet. To the north of these peaks,
but within the limits of Peru, the range declines some de-
grees to the west, running parallel to the coast, and here
other snow mountains occur. [Peru.]
at 13,000 feet, runs in its southern portion nearly parallel to the meridian, but north of lat. 17° it forms an angle of almost 35° with that line, running very nearly north-west-by-north, and south-east-by-south. Not having any outlet to the sea, the rivers which bring the second unit of water are either lost in the sandy soil, or empty themselves into the lake of Titicaca at its northern extremity. This lake, the largest in the South American continent, occupies an area of about 4,000 square miles, and its surface is 12,705 feet above that of the Pacific. It is one of the deepest lakes in the world; its bottom is lost in 6,290 fathoms, but many parts are probably much deeper. This lake receives numerous streams at its northern extremity, but not all the waters which descend from the sides of the mountain-ranges. It is remarkable that the watershed on the eastern part of the valley extends to 18° 30' S. latitude, whilst on the western, it is not formed by the high ranges, but by too few lateral ridges distant from twenty to thirty miles from the lake, and generally rising from 500 to 1,000 feet above its level. The waters collected between these lateral ridges and the high mountain-ranges descend eastward to the plains traversed by the river Madeira and its upper branches; and westward towards the sea. The only outlet of the lake of Titicaca is the river Desagüadero, which issues from its south-western extremity in lat. 16° 38' 10", and is a small stream when compared with the immense extent of the lake. Its depth however is considerable, but its velocity is scarcely two miles an hour. It runs southward, and forms near 19° a lake, called Lago del Desagüadero, in which it is lost. Its course between both lakes may be 180 miles.

The climate of the valley of the Desagüadero offers many peculiarities. Being in its lowest part upon the surface of the sea, it may be 180 feet above the level of the sea, the heat is never great, nor is the cold very sensible, except during the night from May to November. This season, which is the winter, is extremely dry; the sky is cloudless, and neither rain nor snow is known to fall. But snow precedes and follows the rainy season, which in this valley begins at the end of November, and continues through the summer months to the beginning of April. During these months it rains nearly every day, more or less; but during the night the sky is clear, and no clouds are generally seen in November and April.

The vegetation of this valley has also a very peculiar character. There are no trees, but the lower districts, especially near the great lake, are covered with the most beautiful green turf where the land is not cultivated. The cultivated plains and fields, with a few thorn trees, and small size, are indeed sown, but they do not ripen, and are cut green as fodder for the llamas. The plantations of quinoa (Chenopodium quinoa, Linn.) are extensive, and also of potatoes, which are found growing wild in some more elevated places; these plantations extend across a considerable distance on the upper slopes of the adjacent hills. There are no peculiar seasons for sowing or harvest, and the natives are continually occupied either in performing the one or the other operation. The country which extends between the ridges of hills and the valleys, is covered for the most part with vast plains, covered with a coarse grass, on which numerous herds of llamas are fed. Here also the guanacos, alpacas, and vicuñas feed in a wild state. Besides these, no wild animals have been observed in the valley of the Desagüadero, except a peculiar kind of hare, described by Mr. Benten under the name of Lagotis Cuvieri in the first volume of the 'Transactions of the Zoological Society'; and a small animal of the family Rodentia, which in some places has so burdened the soil as to render travelling on horseback unsafe. The numerous islands in the lake have not yet been described, nor even enumerated. The condor is frequently met with on the mountains. Among the spontaneous plants the rushes which grow along the banks of the lake deserve to be noticed, as the entire want of the water having caused them to nearly dry up, they serve as many uses as the bamboo is employed in India. With these rushes the natives build their huts, and make the boats and sails with which they navigate the lake; made of them are the bed of the poor, and serve in the houses of the rich as carpets.

From this valley six mountain-passes traverse to the western Cordillera to the Andes, and lead to the higher plateau nearly 15,000 feet above the sea, and consequently they are not inferior to the mountain-passes of the Himalayas in elevation. The ascent to these passes from the valley is only 2,000 feet, and the slope is gentle; but the descent from the sea level is extremely rapid, and the great range being close on the maritime declivity of the Cordillera, and consequently at an inconsiderable distance, not exceeding sixty miles, from the sea, the descent must be extremely precipitate and abrupt. A traveller coming from the coast finds himself transported in a few hours from the lowlands of the Cordillera, to an elevation exceeding 15,000 feet.

That portion of Bolivia which extends between the Andes and the Pacific, in length upward of 250 miles between the Bahía de Nuestra Señora and the small river Loa, does not differ much from the coast which extends northward to Guayaquil in Columbia, and southward to Coquimbo in Chile. All this coast, which is nearly 1,800 miles in length, with a breadth varying from thirty to sixty miles, may be considered as a line of sandy deserts. It presents great undulations of surface, and where the top of the back-ground is not for the stupendous and back-ground, which reduces every other object to a comparatively diminutive size, the sand-hills might sometimes be called mountains. This long line of deserts is intersected by rivers and streams, which are seldom less than a hundred feet wide, and sometimes many miles wide. On these are the only places which are inhabited; and the narrow strips on each bank of every stream are peoples in proportion to the supply of water. During the rainy season in the interior the rivers swell prodigiously, and can hardly be crossed on foot, and a raft of frameworks, that are fastened upon four bull-hides sewed up, made air-tight, and filled with wind. A few of the larger rivers reach the sea, but most of those of the second order are consumed in irrigating the cultivated patches, or are absorbed by the desert where water cannot be obtained. In the north of the country, where a blade of vegetation never grows. Sometimes the banks of the rivers are too steep and rugged to admit of the water being applied to the purposes of irrigation, and consequently the surrounding country cannot be cultivated. No traveller can go from valley to valley without a guide, for where there are no marks to guide his steps. The sand is frequently raised into immense clouds by the wind, to the great annoyance of the traveller, who generally rides with his face muffled up.

That portion of this coast called Atacama, which belongs to Bolivia, is by far the worst. But the greatest part of Bolivia is situated to the east of the Andes, and this portion may be divided into the mountainous district and the plains. The mountainous district extends along the eastern coast to the extremity of Chile, and is composed entirely of the Cordillera, between the latitudes of 17° 20' S. and 17° 40', because the slope of the Eastern Cordilleras towards the plains is nearly as rapid as that of the Western towards the sea, and the branches which this chain sends off extend to no great distance from the principal range. But at about 17° 10' S. lat., a considerable distance from the mountainous portion of Eastern Bolivia. Its western boundary may be fixed at about 63° W. longitude. This country is traversed by many lateral ridges, which are offsets from the great chain of the Andes, and form extensive valleys. Most of the valleys sink slowly, and are maintained by themselves for a considerable distance by the water in the bed of the river. This circumstance, as well as the width of the valleys, renders them particularly fit for agriculture, and for the cultivation of tropical as well as extra-tropical productions. The climate in this country has considered the most salubrious, the most fertile, and the most beautiful parts of South America. Here the slopes of the mountains are generally covered with fine
trees to a great height. This description however applies only to the northern part, between 17° 30' and 20°. Further south the valleys are narrower, and the ranges which enclose them without wood, and nearly without vegetation; with the exception of a few valleys, the only pasture for llamas and guanacos.

No part of America has a greater abundance of water than this region. The rivers which descend from the eastern ddleities are very numerous and contain a volume of water which cannot be exhausted by irrigation. These rivers may be likened to the streams of the Amazon and La Plata rivers, being at a greater distance from the mouths of these rivers than any other streams. This is certainly true, as far as regards the Amazon; for the Cordillera Real contains the sources of the greatest of its tributaries, the Rio de la Plata, which falls into the Adriatic, and the two considerable streams, the Rio Beni and the Rio Mamore, both of which descend from the Cordillera Real and unite their waters between 10° and 11° S. lat. The upper branches of the Rio Beni are the Rio Coca, the Rio Chuqueapo, and the Rio Queto. The Rio Queto, the most southern of them, rises where the Sierra Santa Cruz detaches itself from the eastern Cordillera, and taking a N.E. and N. course enters the plain, where it soon meets the Chuqueapo, which has its origin in the valley of the Desaguadero, on the north- west of the plateau of Bolivia. The Rio Coca, which is only prevented by a low ridge from entering that river, after having passed the town of La Paz, traverses the great chain (16° 55') through an enoious chasm. It then runs for nearly a hundred miles through a fine valley and joins the Coca at La Paz. The junction of these two rivers continues its northern course, dividing the mountainous country from the eastern plains till it meets the Rio Coca. The Coca, under the name of Mapiri, rises likewise in the valley of the Desaguadero, but not quite so near the N.W. angle of the South American continent, and running first north and then east, traverses by a deep chasm, the Cordillera Real north of the Nevalo de Yani, a high snow-capped peak. During a very tortuous course the Mapiri is joined by a great number of streams which descend from the eastern Cordillera Real, and by their union the Rio Coca is formed. This stream joins the united rivers Queto and Chuqueapo about 13° 30', and the river formed by their junction is called Beni, which name it preserves in its northern and north-north-eastern course to its junction with the Mamore. Thus the Beni brings to the Mamore all the waters from the eastern and from a portion of the western ddleities of the Cordillera Real, as well as a portion of those from the Sierra de Santa Cruz.

The other great branch of the Madeira, the Mamore, rises under the name of Cochabamba in the western extremity of the valley which bears the same name, and is distinguished by its cultivation and its numerous products. It first runs E. by S. and afterwards due E., when being swelled by many small rivers, it assumes the name of Rio Grande. It afterwards makes a very large semicircular sweep, by which it arrives at the town of Santa Cruz de la Sierra, whence it runs N.W., and after uniting with the Chaparé at about 16° 30' receives the name of Mamore, and by degrees changes its N.W. course into a N. one. The Chaparé is formed by four or five streams descending from the northern ddleity of the Sierra de Santa Cruz. Before the Mamore unites with the Itané, a large river which rises in the western parts of Brazil, it receives the waters of the Yasuma, whose source is at no great distance from the mouth of the river Queto in the high coast, and for an extremely flat country. The Itané [Brazil] is increased before its junction with the Mamore by the river Uaby, which rises in a lake called Laguana Grande, in the country of the Chiquitos, and is therefore also called Rio de Chiquitos. It finishes its course, which is of a considerable distance from it; but as this part of Bolivia is very little known, we have no certain information about it. After the junction of the Mamore with the Itané, the river continues its northern course till it meets the Beni at the head of the Montes de Guayazu, where the river has the name of Madeira.

The waters which descend from the eastern ddleity of the Andes south of 18° S. lat. go to the Pilcomayo, one of the principal branches of the La Plata river. The Pilcomayo rises at nearly the same distance from the Pacific as the Parana, the other great branch of the La Plata from the Atlantic Ocean; this distance yearly exceeds sixty or seventy miles. Both these great rivers also rise nearly in the same parallel between 20° and 21°; their sources are 20° of longitude distant from each other, or upwards of 1000 miles.

The Pilcomayo rises on the southern ddleity of the mountain-knot called Cordillera de los Lípez, and running generally due east, is soon increased by numerous other streams, some of which are considerable, as the S. Juan, which rises about 200 miles, and falls into the Pilcomayo from the south; the Paspeya, which rises in the neighbourhood of Potosí on the southern ddleity of the eastern Cordillera and soon becomes navigable; and the Cachaymuyo, which rises not far from the source of the Cochabamba, and traverses the southern part of the land of the same name. Soon after the junction with the Cachaymuyo, the Pilcomayo, continuing its eastern course, forms for about 100 miles the boundary-line between Bolivia and Buenos Ayres, when turning suddenly to the south it enters the desert called Grande Chaco, and leaves the territories of Bolivia.

The whole eastern portion of Bolivia, from the banks of the Pilcomayo and the frontier of Buenos Ayres to the junction of the Mamore and Beni, is one extensive plain, which from east to west extends about 200 miles, and from north to south about 200 miles. The surface is quite level, and ranges of hills rise in some parts, but neither their place nor their height has been determined with any degree of accuracy. In the southern part of this plain lies the watershed between the affluents of the Amazon river and those of the La Plata, and in the middle part of it, where the hills appear to rise to any great height above the sea. This plain is principally watered by the Beni, the Mamore, and the Ushary, which in the rainy season, from October to April, inundate the country along their banks to a considerable extent. In many places their lakes are so large that they are very large, the exhalations, united with those from the inundations, render the climate excessively humid. This humidity, added to the heat which prevails all the year round, gives rise to many dangerous diseases, and renders the surface very pestilential. This part of the republic has consequently been almost abandoned by the Creoles, though its great fertility would better repay the labour of the cultivator than any other district of the country. Immense forests of high trees cover nearly the whole of these plains, but the useful productions of them are entirely neglected, except that a considerable quantity of coca is gathered by the natives and brought to the towns of San Lorenzo de la Frontera, La Paz, and Cochabamba. The plantations consist commonly of maranducas and maize, those cotton and rice being rare; all the other tropical productions which might be cultivated with the greatest advantage are almost entirely neglected.

Where the borders of Bolivia, Brazil, and Paraguay meet, the Lake of Xaragas extends along both banks of the river Paraguay, and their lake has repeatedly disappeared and reappeared on our maps. As far as it is known, there seems to be in this part of South America an extensive depression of the surface, which being traversed by a large river subject to a considerable annual increase of water, is by turns inundated and drained; but how far this depression of the surface extends is not determined, this quantity of water is gathered by the natives and brought to the towns of San Lorenzo de la Frontera, La Paz, and Cochabamba. The plantations consist commonly of maranducas and maize, those cotton and rice being rare; all the other tropical products which might be cultivated with the greatest advantage are almost entirely neglected.

Rain never falls on the coast along the Pacific. In the valley of the Desaguadero, in the mountain-region, and in the plains, the summer is the rainy season; but the rain is so scanty that the water is detained in the mountains, which are subject to tremendous hail-storms, during which the traveller is obliged to halt, and the parts of the body which are exposed are so severely bruised and cut by the hailstones as to bleed copiously. Thunder-storms are also peculiarly severe in this elevated country. It is not uncommon to see the clouds pass by to a temporary blindness called cursumpi, which is caused by the rays of the sun being reflected from the snow, and rendering it impossible to open the eyelids for a single moment; the smallest ray of light becomes absolutely insupportable. The complaint resulting from this is called congelagia, which is very common along the coast of the Pacific, less so in the valley of the Desaguadero and the mountain-region, but in the plains they have not been observed.

The scanty productions of the Valley of the Desaguadero have been noted. The few places on the coast which are
cultivated produce no grain but maize - excellent fruits however grow, especially figs, olives, and melons, besides pomegranates, plantains, and algarrobas (Prosopis dulcis), a kind of pulse, which grows to the length of a Hamb.

The other portions of the republic, especially the beautiful vales watered by the Cochabamba and Carora Rivers, are more fertile. As the streams which occur along their banks are at different elevations above the sea, they abound in all the fruits, grains, and other agricultural productions common to Europe and to tropical countries. Among the spontaneous products are cocoa, sarsaparilla, and several species of the cinchona family. Of domestic animals, there are horses, asses, and mules, but for sheep the climate is too warm. Great herds of horned cattle find abundant pastures on the banks of the rivers in the plains.

The inhabitants seem to be unknown to the naturalist. There have however been noticed different kinds of parrots, several species of turkeys, and a multitude of beautiful singing birds, as the thrush, the whistler, and the maltico, remarkable for its plumage and the sweetness of its note.

The inhabitants, besides those of the plains, abound in fish; but the names given to them by travellers render it difficult to determine if any of them resemble those of Europe.

Gold is found in abundance in many places, but especially in the mountains of the eastern Cordilleras, where it is washed down by rivers which run between slate-mountain banks of narrow ravines. All the waters descending from this range, which fall into the Beni or its branches, carry down gold sand, but more particularly the small river Titipuan, which falls into the Mapi. The mines of Potosí have long been considered as the richest in the world for their produce of silver, but they are now little worked, which is also the case with other silver mines. Copper is likewise abundant: at Coroecuro, a small place about seven leagues from Potosí, copper mines of good quality are worked. Pure copper is found crystallized in the form of perfect cubes. Though, according to some experiments, this ore contains seven-eighths of pure copper, it cannot be turned to any use, being found in very high mountains and at a great distance from the coast. Besides these metals there are ores of lead and tin; and saltpetre, brimstone, and salt.

The inhabitants of Bolivia are composed of aborigines, and of people of foreign extraction. The aborigines form by far the greater portion of the population, probably more than three-fourths. They may be divided into those who speak the Quechua language, and those who speak different dialects. The Quechua language prevails among all the inhabitants of the coast and of the valley of the Desaguadero. Agriculturally, it had been adopted by them before the arrival of the Spaniards, and they still hold to their way of life, though their soil still consists partly of fish and game. Some of them make excellent cotton cloth, and in general they have a taste for mechanical arts, and are good carpenters. They show also some talent for music and painting, in which they excel the natives of the coast. But the Indians who inhabit the Lower Beni below Reyes, and those on both sides of the Uaby, as well as the Chiquitos, who occupy the country bordering on Brazil and Paraguay, still lead a roving life, live mostly on wild roots and fruits, and on game, and are as they say Mayo. The inhabitants of foreign extraction are either the descendants of Spaniards, or of Africans and the mixed races.

The descendants of the Spaniards are most numerous in the mining districts, and in the valleys of the Cochabamba and Cañar Rivers, where they may be seen in immense numbers. In the great basin of the Uaby, they are less numerous in the coastal districts, and in the valley of the Desaguadero, and their number in the plains is very small. The people of pure African blood are few in number, but the mixed races, which owe their origin to a mixture with negroes, are numerous on the coast; much less so in the mining districts, and in other parts very few of them are found. The population of Bolivia has been differently stated. At first it was asserted that it amounted to 1,200,000 souls; but this is evidently an exaggeration. Immense tracts of land are not cultivated, and nearly uninhabited, and the bulk of the population is concentrated in two larger and several smaller valleys. More recent information has reduced the population to 630,000. As however no recent census has been made, it is necessary, in order to estimate the extent of the Indian population, not even visited by Europeans, the population cannot be ascertained with any degree of certainty.

The republic of Bolivia is politically divided into five departments and each department into provinces.

I. The department of Potosí comprehends the most southern portion of Bolivia; namely, the whole of the coast along the Pacific, the south-western part of the valley of the Desaguadero, and the southern part of the mountain-region of the Cochabamba. The climate is very dry, and the population is not cultivated, and nearly uninhabited, and the bulk of the population is concentrated in two larger and several smaller valleys. Nearly the whole of its surface is covered with sand or barren mountains, but as it contains numerous mines of silver at Potosí, Porco, and other places in the northern range, which have been long worked with considerable success, the country is populous than any part of the republic, except the valleys of the Cachay Mayo and Cochabamba. It is divided into five provinces, Atuncama, Lipez, Porco, Chayanta, and Chicas.

II. The department of Charcas or Chuquisaca extends over the mountainous country between the rivers Paspaeya and Rio Grande de la Paz, which the valley of the Cachay Mayo is comprehended in all its extent, and a great portion of that of Cochabamba. A small part of the valley of the Desaguadero is also included within its limits. It contains some considerable mines, and is, with the following department, the most populous portion of Bolivia, on account of its fertile soil, and the good harbours, and through the communication between the other parts of the country is rendered exceedingly difficult and expensive on account of the high mountains and the sandy desert along the coast, one of them, Colca, at present exists, are called, the political seat from which the province is governed. It is divided into six provinces, Potosí, Yampará, Tomina, Páira, Oruro, and Carangas. Chuquisaca is the capital of Bolivia. Oruro in the valley of the Desaguadero, nearly 13,000 feet above the sea, contains upwards of 5000 inhabitants, in whose neighbourhood considerable silver mines are worked. A road leading from Oruro to Potosí traverses the southern part of the eastern Cordillera, and rises in the mountain-pass of Tolapalia to 14,075 feet.

III. The department of Cochabamba lies to the north of the Moxos,[ch], and contains a considerable part of the rich and well-cultivated valley of Cochabamba or Guapí, the Serría de Santa Cruz, and the fine valleys which lie on the northern declivity of this chain. Every kind of agricultural produce is here grown in abundance, and some of the rivers which fall into the Chaparé gold is col
lected. This department is divided into six provinces, Sa-
cába, Tapacari, Arque, Palia, Chissu, Misque.

The capital of this department, Oropesa, contains about
16,000 inhabitants, and is the most industrious of the
towns of the department, and through the whole of the
year is glutted with the staple product of the department,
which is carried on to some extent. It is situated at
the western extremity of the department in a fine valley,
traversed by the Cordorillo, a branch of the Cochabamba.
The small town Cochabamba, from which the department has
received its name, lies on the banks of the river Guapui or
Cochabamba.

IV. The department of La Paz extends over more than
half of that part of the valley of the Desaguadero which
belongs to Bolivia, and more particularly over the northern
part of the great plain of the plains of the Pampa del
the Nevado de Illimani northward, the numerous valleys
which lie on the eastern declivity of that range, and
that portion of the plain to the west of the Rio Beni.
The lower part of the valleys and the plain are very fertile,
but only a few are cultivated. The river brings down
a great quantity of gold sand. It is divided into six pro-
vinces, Pacayes, Sicá-sica, Chulumani, Omasuyos, Lare-
caja, and Apolobamba. It contains only one town of
importance, the capital La Paz.

The department of Santa Cruz de la Sierra is by far
the largest and extends over nearly the whole plain which
constitutes the eastern part of Bolivia. The greater part
of it is still occupied by independent tribes of Indians;
and other districts, where the Creoles had formerly settled,
have been abandoned on account of their unhealthiness. It is
divided into the provinces of Pampas, Guarama, Pampa,
and Baures. Some time ago it was reported that the
inhabitants of this department were not inclined to join
the republic, but intended to form a separate state under
the name of Santa Cruz de la Sierra, but no certain infor-
mation has reached us on this subject. The capital of
the department is San Lorenzo de la Frondosa, not far from the old
town of Santa Cruz de la Sierra, on the banks of the Rio Grande
de la Plata, with about 10,000 inhabitants.

The localities are very little known of the pre-cast political
condition of this part of the country. Ayres had re-

The road connecting Taca on La Paz traverses
one of the two passes called Las Guallillas, of which the
upper (17° 43') rises to 14,200, and the southern (17°
50') to 14,530 feet, and though foreign commodities pass
their passes in a time of 3 hours, and the service is
a matter of 3 per cent, this road is preferred for the trans-
port of merchandise. Few foreign commodities are imported
into Bolivia. They are chiefly iron and hardware, with
a few articles of finery, as silk, &c. The exports are nearly
exclusive of precious metals, of which, and kind of wool, made of the wool of the llamas and
alpacas, and to hats made of the wool of the vicuñas. The
agricultural products of this country will never be exported,
till commerce has made its way up the Amazon and Ma-
duara rivers. Being as it were excluded from foreign commerce, the Bolivians are obliged to satisfy their wants by their own in-
dustry. The manufactures of cotton are the most extensive.
The better kinds are made in Oropesa; but in many dis-
tricts the Indians make great quantities, which are coarse
though strong. Next to these are the woolens, made of the
hair of the llamas and alpacas. The coarser kind, called
hansacas, is used by the lower classes for dress, and
likewise for blankets; the finer sorts, called cambis, are em-
brodered with great care, and used as coverlets by the
rich. The best are made at La Paz, and a very good one
is made of the wool of the vicuña at At San Francisco de Atacama. Very fine hats are made of the wool
of the vicuña, and at Oropesa very good glass is made.
In some towns in the neighbourhood of the silver-mines
they make the best silver-wires, which are not without
benefit, but Meyen thinks that those made of silver wire are
superior in taste and much cheaper. In some districts
the Indians dye the plumes of the American ostrich with brilliant colours, and make of them fans and a kind of paro
cula. (Pen and Parish in Geogr. Journ. 5; Meyen's Reisen um die Welt; Memoirs of General Miller;
Capt. Basil Hall; Temple: Azara.)

BOLLANDUS, JOHN, a learned Jesuit, was born at
Thieten (Tirlemont) in the Netherlands, August 13th,
1596. He entered the Society of Jesus at the early though
unusual age of sixteen, and became, after seventeen years,
teacher both in the Netherlands and other countries. The
share which he took in the Acta Sanctorum, or ' Lives of
the Saints,' entitles him to especial notice.

The history of this work is not uninteresting, although
the work itself is otherwise than for occasional consultation,
defies time and patience. It consists of fifty-one volumes
in folio, of the larger size and bulk. The design of this
vast collection was first projected by Père Herbert Ro-
weide, a Jesuit then of the age of 50, and consequently
determined that his book of the place shall extend no further than six volumes folio, with two
volumes of illustrations: a trifle in those days, had he
begun earlier. In 1607 he had begun by printing an octavo
volume, entitled Fasti Sanctorum, consisting of the manu-
script lives of a few saints, which was sold at Amsterdam.
In 1613 he was sent to the Netherlands; but he died Oct. 5th 1629, before he
could accomplish what he had undertaken. The exe-
cution of his project was then entrusted to Bollandus,
who was about this time thirty-four years of age, and
who removed from Mechlin to Antwerp for the purpose.
After examining Rossweide's collections, he established a
general correspondence all over Europe, instructing his
friends to search every library, register, or repository of
any kind, in which information might be found, and he
paid the weight of his undertaking he called in the assistance of another Jesuit, Godfrey Henschen
goedlander, younger than himself, more healthy, and
equally qualified in other respects. With this aid he was
enabled to publish the first two volumes of this work, Antwerp,
1624, which contain the lives of the saints of the month
of January, the order of the Calendar having been preferred.
In 1658 he published those of February in three volumes;
and two years after, his labours still increasing, he engaged in
another task, that of new editor, and in 1644 he was
about thirty-two years old, whom he sent with Henschen to
Italy and France, to collect manuscripts, but he died before the
publication of another volume, Sept. 12th, 1665. After
his death the work was continued by various hands, who
were called Bollandists, and who have published the lives of the saints of the month of March in three volumes, Antw. 1668; those of April in three volumes, 1675. The saints of the month of May occupy

No. 289.

THE PENNY CYCLOPEDIA.] Vol. V. N.
BOLOGNA (Lat. BONONIA), a city in the Papal State, next to Rome in population and importance. It is situated in 44° 30' N. lat. and 11° 20' E. long, in a plain north of the Apennine ridge and between the rivers Reno and Savena. A canal, called Naviglio, navigable for large boats, connects Bologna with Ferrara, from whence, by the navigable canals of the Po, the produce of Lombardy is sent down to the water-communication extending to Venice. The population of Bologna is about 70,000, but with its surrounding territory or commune about 74,300. (Calandr. Saggio Statistico dello Stato Pontificio, 1830.) Towards the end of the last century, when Benedict the 11th Annalisi Bolognesi was established, the population of Bologna was then reckoned at 70,000.

Bologna is a thriving city, with an industrious population: the higher classes, who consist chiefly of landed proprietors, are wealthy. Many noble families reside at Bologna, and the most remarkable are the Grassi, holders of the office of the Prince of which the palaces Fava, Magnani, Bentivoglio, Zambellari, Marescalchi, Bevilacqua, Lambertini, Bacciochi, whose owner is Napoleon's brother-in-law, Ercolani, Malvezzi, Sampieri, have valuable galleries and fresco paintings by the great masters. The palace of the Podesta, in which Hentzius, son of the Emperor Frederico II., and nominal king of Sardinia, spent in confinement twenty-two years of his life, and in which he died in 1272, contains the archives of the city. The Palazzo del Pubblico, a large structure, is the residence of the cardinal, and the offices of the archbishop.

In the square before it is a handsome fountain with the colossal statue of Neptune by Giovanni da Bologna.

Bologna abounds with churches, most of which are rich in painting. The principal are San Petronio, a magnificent church, the church of San Domenico, where the body of Bolognino was traced on its pavement by the astronomer Cassini; the cathedral: and the church of San Domenico, with the tombs of Hentzius, of Taddeo Pepoli, the best magistrate of Bologna in the time of the republic; of Guido and his pupil Bisanzio; the church of San Petronio, and the church of San Domenico, all containing works of art of the first rank. The adjoining convent is the residence of the Tribunal del San't Uffizio or Inquisition, which still exists in the Roman States, where however its power is little felt, and it has none of the terrors of the Inquisition such as it existed in the thirteenth and fourteenth centuries.

Bologna is surrounded by walls and has twelve gates; the streets are tolerably wide, and most of them have low arcades on each side to shelter pedestrians from the rain. In the centre of the city are two lofty towers, the highest of which called Asinelli, from the name of its founder, is 320 feet high; the other, Garisenda, is only about one-half of the height of its neighbour, but inclines on one side about nine feet. This inclination, it is said, like that of the tower of Pisa, was the result of a depression of the ground surrounding it, and the fear of its effect produces on the beholders is finely alluded to by Dante in canto 31 of the 'Inferno.' The Asinelli is also a little out of the perpendicular, though in a much slighter degree. Both towers date from the twelfth century. It has been observed that Bologna, seen from the neighbouring hills, has in its outline the appearance of a vessel with one mast, represented by the Asinelli, while the inclined Garisenda represents the chains.

The University of Bologna is the oldest and still one of the first in Europe. Its origin is stated to have been under Theodosius II., and it is said to have been restored by Charlemagne. We find it enjoying great celebrity early in the twelfth century. It has the following classes,—theology, medicine, law, philosophy and mathematics, and belles lettres. The students are divided into different faculties, with chairs and filled chairs. For the distribution of the various courses, and other details concerning the method of instruction, we refer to an article in No. XVI. of the Quarterly Journal of Education on the Statistics of Education in Italy. Anatomical and chemical laboratories are numerous. There is an anatomical cabinet, and a library containing 80,000 volumes and 4000 MSS. Among the actual or late professors of the University of Bologna the following names deserve mention,—Galvani, Zannotti, Monti, Orioli, Tommasini, Rizzoli, Agostini, and Procopio, who was one of the last professors of Greek, who died in 1817. Bologna boasts of other female professors, especially Novella d'Andrea, who taught canon law in the fourteenth century; and Laura Bassi, professor of physics, in the eighteenth century.

Besides the library of the university, the city of Bologna...
has a public library, the legacy of a clergyman named Magnani, which occupies three rooms of the convent of San Donato in Bologna. The library contains 17,000 volumes, collected by Father Martini, and is one of the Bolognese school. The Instituto delle Scienze, founded by Count Marsigli, has an observatory. The Philharmonic Lyceum, in which 100 pupils are maintained at the expense of the city, also possesses one of the most splendid galleries of paintings, chiefly of the Bolognese school. The College Venturoli, founded in 1825, is devoted to students of architecture.

There is also a college for Spanish students, founded by Cardinal Albors; and another for Flemish students, who are sent here for the golden youth. The College of the English was founded by John Jacobs, a Flemish goldsmith, and a friend of Guido. The public school for the children of the poorer classes is a fine building by the Bolognese architect Terribili; the children are taught, gratuitously, Latin, arithmetic, and drawing. (Valley, Voyage Littéraire en Italie, 1835.)

Bologna is an archbishop's see, and the series of its bishops ascends far back to the fourth century. St. Petronius, who lived about 436, was the tenth bishop of Bologna. The city as well as its province, called Legaziano, are administered by a cardinal legate appointed by the pope. The court of appeal for the four provinces of Bologna, Ferrara, Ravenna, and Forlì, sits at Bologna, and consists of six judges.

There are several manufactures of silks, paper, and pottery. The large sausages of Bologna, called mortadella, have a long established reputation, as well as its liqueurs and confitures. The people of Bologna are frank, spirited, and fond of gaiety; they are the most independent in mind and action in any of the Papal States, owing probably to the long enjoyment of their municipal liberties; the lower classes are noisy, and their dialect is the most unco and rough sounding in all Italy. The women are generally good looking. Among the educated classes there is much information, and Bologna is still one of the most learned towns of Italy. There is a casino, or assembly-rooms for the nobility, besides reading-rooms and private conversazioni. There are several theatres, at which some of the best performers of Italy are generally engaged.

The air of Bologna is pure, but the sudden changes of its temperature, owing to the proximity of the Apennines, occasion frequent inflammatory diseases. Cutaneous diseases were formerly common among the people, but the increase of cleanliness, and a better diet, have given considerable relief. Bologna is one of the Italian cities in which there are most foundlings; about one-seventh of the births are illegitimate.

Bologna has produced many distinguished individuals. No less than eight popes have been natives of this city, among the most famous of whom is the naturalist Aldrovandi, the anatomist Mondino, who was the reviver of anatomy in Europe at the beginning of the fourteenth century, the physician and naturalist Malpighi, the mathematician and engineer Eustachio Manfredi, the brothers Zannotti, Galvani and his nephew Aldini, Zamberti, and many more scientific and literary men were natives of Bologna. Fantuzzi has devoted no less than 9 vols. to the biographies of Bolognese writers: Notizie degli Scrittori Bolognesi, 1788.

Outside of the walls, the Campo Santo, or cemetery, contains many handsome monuments, which have been illustrated in a recent work: 'Collezione scelta di Cento Monumenti Sepolcri del Cimitero di Bologna.' On the hill called Della Guardia, about three miles from Bologna, is the handsome church of La Madonna di San Luca, which is joined to the town by a long arcade consisting of 636 arches. The once splendid monastery of S. Michele in Bosco was sadly dilapidated during the French wars, and its frescoes by the Caracci and others were nearly effaced by the hands of the soldiery.

The origin of Bologna is lost in obscurity. It was the principal city of the Etruscans north of the Apennines, and was then called Felsina. When the Gauls invaded Lombardy, the Boi, one of their tribes, crossed the Po, and established themselves in the old Etruscan city. Afterwards the Boi became involved in wars with Rome, and they were favourable to Hannibal in his invasion of Italy. After the end of that war the Boi, with the other Cisalpine Gauls, were conquered by the Consul Scipio Nasica, and Felsina became a Roman colony B.C. 191. The Romans took the name of Bologna from the Via Flaminia, which was carried from Ariminum through Bononia. In the civil war between Antony and the senate, Bononia was attached to the party of the former, and it was here that the Consul Pansa, defeated by Antony in the battle of Issus, died of his wounds 20. 10. 47.

In the autumn of the same year the famous meeting took place between Antony and Octavius in a small island formed by the river Rhenus (Reno) between Bononia and Mutina. The precise site of that island has been a matter of dispute. There are documents as late as the thirteenth century in which the appellation In Lago Bononienses occurs as best in the district of Borgo Panigale, which is a village about four or five miles north-west of Bologna, and two or three miles north of the point on which the road from Bologna to Modena crosses the Reno. It appears also that the little river Lavinus, a Naviglio, led to Bologna, which flowed northwards into the Samoggia, whence the united streams run to join the Reno above Cento, formerly on descending from the Apennines into the plain of Bologna took a short cut to the eastward into the Reno, not far from the town, and somewhere about the spot where the island is supposed to have been, and this junction would serve to explain the words ad confluences used by some historians in speaking of the place of meeting. The Reno, like all Apennine streams, is subject to overflows, and consequent alterations in its bed, and it forms even now several little islands near Bologna.

A fire consumed great part of Bononia under Claudius (Tacit. xii. 59), when 10,000,000 sestertii were granted from the public treasury for rebuilding the town. On this occasion Cajus, who was then proconsul of Italy, and Metellus, the proconsul of Africa, were both compared to the fire of Bologna. (Sueton. Nero, vii.) In the third century the first Christian church was built in Bononia, and dedicated to St. Felix, which was afterwards destroyed in the persecution under Diocletian, when Priscus, Agnello, Vitalis, and other Christians of Bononia, suffered martyrdom. Bononia escaped with comparatively little damage the invasions of the northern barbarians. Alaric besieged but did not take the city. It also seems to have escaped the ravages of Attila. In the time of the Longobards Bononia formed part of the exarchate of Ravenna under the eastern empire, until Liutprand occupied it with the rest of that province. Bononia was one of the towns given by Pepin to the see of St. Peter, after his defeat of the Longobards. Under the church, Bononia was administered by bishops and archbishops, princeps comitatus. Under the Other of Saxony, Bononia, as well as the other cities of North Italy, obtained privileges and franchises as imperial towns governed by their own municipal laws. Under Conrad the Salic we find counts of Bononia, who administered justice together with the Missi of the emperor.

In the wars of the investitures between the church and the empire, the towns became de facto independent of the latter. The municipal independence of Bononia or Bologna was acknowledged by the Emperor Henry V. in 1109. The city held the right of coining money. The citizens assembled in general comitia, and appointed the magistrates, at the head of whom were the consuls, who were chosen from among the class of merites or nobles only. The judges and notaries were appointed by the emperor, in whose name the judges administered justice. The town was divided into four wards, the militia of which were commanded by their respective vexilliferi. The country districts were subject to the town, the territory of which was at first extremely limited, being surrounded on one side by the river Reno, and on the other by the hilly ground of the Apennines which enclosed all the towns and monasteries, which were independent of the jurisdiction of the town. By degrees however several of the surrounding nobles applied for the citizenship, and being admitted came to reside in the town. Others lost their privileges, and the country districts gradually came to rule over a great part of Emilia, the country now generally called Romagna, which extends from Bologna to Rimini.

In the war between Frederic I. and the Lombard League.
Bologna joined the latter. It likewise fought against Federico II., on which occasion the Bolognese took prisoner Hentzius, the natural son of the emperor, whom they detained in captivity till the time of his death. The war of the Bolognese against the Modenesi, who were of the imperial family, lasted for a long time, and was called, from a burlesque poem ‘La Secchia Rapita.’ The factions of the Guelphs and Guideline proved the ruin of the liberties and independence of Bologna, as well as of the other North Italian cities. Ambitious and rival families sided under each faction, and the former great city, being worsted in the city by the Geremee, the chief family of the Guelphs, were, after much bloodshed, driven away in 1274 with 15,000 of their partizans and dependents, men, women, and children. They however rallied in the towns of the plains and reached Tassoni. Georgio Cattaneo, lord of Urbino, and made incursions to the very gates of Bologna. The Geremee applied to the pope for assistance, offering to acknowledge him as liege lord of Bologna. Pope Nicholas III. accordingly sent a legate to Romagna to restore peace to that province, and through his mediation the Guelfine exiles were recalled. The pope was now acknowledged protector and suzerain of Bologna.

In 1334 the pope's legate, Cardinal Bertrand du Poit, having rendered himself odious to the people by his tyranny, was deposed and sent to prison by the people of Bologna, which declared itself a republic, under the head of a wealthy citizen, Jake Lord. He used his authority with temperance and justice and for the good of the community for more than three years. He extended the activities of his predecessor in the papal legates, now a prey to popular anarchy, and now subject to some of its own principal families, among which that of Bentivoglio, made itself very high in the city, through Giovanni Bentivoglio, the son of Prince della Signoria, or first magistrate of Bologna, in 1462, and he retained the chief authority over the state for forty-four years, under the nominal high dominion of the papal see. [BENTIVOGLIO.] Giovanni however incurred the displeasure of the haughty pontiff, Julius II., and he was compelled to retire from the city, where he established the direct domination of the church. In 1511 the sons of the late Giovanni Bentivoglio, supported by the French, regained possession of Bologna, where they remained until the following year, when, after the battle of Ravenna and the retreat of the French armies, the town surrendered again to Pope Julius, who built a castle to keep the citizens in awe. From that time till the end of the eighteenth century Bologna remained subject to the papal see, retaining however its senate, the municipal officers, the city gates, and the market towns and market-towns: the principal arc, St. Agata, 3000; St. Agostino, 5000; Argetata, 3000; Argile, 2600; Barcella, 5000; Bazzano, 2200; Borgo Panigale, 3400; Budro, 10,000; Calderara, 3000; Castelfranco, 5500; Castello Guelfo, 2400; Castelmaggioro, 3400; Castel S. Pietro, 6000; Castiglione, 2800; Creppellano, 3400; Crevacore, 6500; Galliera, 3200; S. Giorgio di Piano, 3300; S. Giovanni in Persiceto, 6700; Granaglione, 2700; Loji, 3000; Malabergo, 4700; Medicina, 9000; Mollinella, 7000; Minierbo, 6500; S. Pietro in Cariano, 3600; S. Gregorio Magno, 3000; S. Maria in Organo, 4500; S. Pietro in Cariano, 3600; S. Gregorio Magno, 3000; S. Maria in Organo, 4500. These numbers include the whole population of the respective territory or commune, of which, generally speaking, about one-half may be reckoned as the resident population of the town, the rest living in detached farm-houses, cottages, or in the Via, VICO, being all parishes and market-places, and many of them are surrounded by walls. They have each a municipal council composed of twenty-four or eighteen members, taken one-half among the nobles or chief proprietors, and the other half among the tenants or farmers. Seats in the municipal councils are determined according to the qualification of holding possessions or domicile within the commune, being past twenty-four years of age, and having a good moral character. Two relatives in the first degree cannot sit in the same council. Vacancies in the councils are filled by the councilors themselves, and the people elect the magistrates, i.e. the gonfalonierie, and four elders, and all the other communal officers and servants. The gonfalonierie is renewed yearly, the elders are renewed by halves every year. The councils vote every year the municipal expenditure, as well as the taxes and other means to provide for it. This budget must be approved by the legate, after which it is printed and published. The council administer the communal property, subject likewise to the inspection and approbation of the legate. The government of the city is shared by the commune and the guilds.

The peasants of the province of Bologna are seldom proprietors, few have even leases, but they hold their farms from father to son by tacit agreement, giving one-half of the produce to the landlord and paying half the taxes. Several classes of the people of the country, by the practices of their ancestors, are nearly poor, and working together on the same farm. They are sober, peaceable, and industrious, and generally superior in morality to the lower classes of the cities. The farms are not so large as in Lombardy, but the peasantry live better on the produce of the field. This explains why there so few rich and poorly paid labourers of the latter country. This metayer system prevails over most of the northern papal provinces, and also in Tuscany.

Upon the whole the province of Bologna is one of the finest and richest in the papal state. The mineral waters of the province are very numerous and the Bobbinese, in the Apennines are much frequented by invalids.

BOLOGNESE SCHOOL OF PAINTING. The historians of the fine arts employ the word school, as it is often used in reference to other pursuits, only to denote a similarity of opinion, aim, or practice among many individual persons; but the term is so far true to its literal import, that the similarity of taste alluded to does not so much arise from the accidental coincidence of independent modes of thinking, as from some common influence, and generally from the example of one powerful hand. For if we always involve a defect of originality; in the complicated art of painting the advances to perfection were of necessity very gradual; the greatest masters were largely indebted to the labours of their predecessors, and each of them may thus be said to have sprung from a school as certain as that he founded one. But when excellence was one ap
proximated, originality seemed only compatible with a difference in the mode, since a difference of degree appeared to be all that was required of the Renaissance. Vasari found it sometimes degenerated to caprice, and imitation ended in insipidity, the most plausible ambition seemed to be that which aimed at combining excellences not hitherto united in any one school. This was at the least the professed object of the Florentine painters, and produced some of the most distinguished masters. It happens that this new effort took place in a school which had not before distinguished itself so greatly as the rest. The most brilliant epochs of art, south of the Alps, continue; the greatest masters having been contemporary with the Bolognese school of the sixteenth century. To this rule, which applies to Venice, Parma, Florence, and Rome, the Bolognese school is an exception, since it attained its comparative perfection nearly a century after the production of the finest works of Italian art.

As to the distinguishing marks of the later masters of the Bolognese school have been done ample justice to by many historians and biographers, but it must be confessed that the Florentine Vasari, who was naturally anxious to extol the genius of the Tuscan artists, sometimes betrays a disposition to undervalue or to vilify the earlier Bolognese painters whom he notices in his work, and he did not live to see the revolution which the Caracci produced. The chief historian of the Bolognese school, Malvasia (Felsina Pittrice), on the other hand, in his eagerness to defend his countrymen, has often, if not unfrequently exaggerated their merits, and the two should be read with care. The opinions of recent writers, among whom Lanzi, though again perhaps disposed to exalt his own Florence, will be found the most rational.

The arts of design were kept alive during the middle ages by manuscripts and illuminated manuscripts; the former were commoner at Rome and Ravenna, than in the other Italian cities, but the art of missal-painting, which was practised wherever there was a monastery, seems to have attained some perfection at Bologna at an early period. This is shown by the masterpiece of the monastery of San Domenico (Ranato 11) as superior in this to his master, Oderigo di Agubbio, it appears sometimes painted in larger dimensions, and the recorded dates of still earlier painters might enable Bologna to contend for the palm of antiquity not only with Florence but with Senigallia and Pisa. Franco, who has been called the Giotto of his school, is the supposed founder of the style of the Bolognese painters of the 14th century. Many of their now fading works exist in the church of Mezzaratta, a gallery, as it were, of ancient specimens, which, as Lanzi remarks, is to this era of the Bolognese school what the Campo Santo at Pisa is to that of the early Florentines. In order, however, that this comparison should be just, it would be necessary to select corresponding dates; some of the works in the Campo Santo, as by Gherardo and Benozzo, were executed after the middle of the 15th century.

About 1400 the most prominent name is Lippo Dalmasio, called, from the subjects to which he almost confined himself, Lippo delle Madonne: some of his works remain, and Malvasia relates, with reference to one in the church of S. Procolo, that he had made them pure and grandeur of expression, and assert that, notwithstanding the subsequent advancement of the art, no modern painter could infuse so holy a feeling into similar subjects. In this early epoch of the school the predilection for the style of the Grandezza is not so deeply rooted as to have been more decided, and to have lasted longer than any other. It may be here observed that the modes of representation to which the Byzantine painters and their Italian followers adhered were in many cases conformed by reason of the very nature of their art, the same rude as they were, often exhibited a solemnity of treatment which may in some degree account for the veneration in which they were held. The Florentines who visited Bologna and painted there left no permanent impression; a native artist might very easily have had the advantage of his visitors, but the rival of Mantegna and afterwards at Venice, introduced the arrangement of the Venetian altar-pieces in some works subsequently done by him in Bologna; but the early simplicity or severity was preferred perhaps as fitter for the subjects; it was certainly the earliest cultivated by the greatest painter of the first epoch, Francesco Francia. This artist, who was contemporary with Raphael, and survived him some years according to Malvasia, was celebrated as a goldsmith and engraver of medals before he betook himself to the pencil as a comparatively advanced art. Vasari says that the first picture was dated 1490. He is celebrated as a painter who succeeded beyond most others in giving an expression of sanctity and purity to his Madonnas, and a letter of Raphael's is extant in which this merit is particularly praised; in these, the eulogists of Francia have in vain endeavoured to exalt him to a level with the painters of the first rank with whom he happens nearly to coincide in date. Vasari relates that when the St. Cecilia of Raphael made its appearance in Bologna, according to the principal critics there, Francesco Francia was consigned by the great painter himself, was so amazed at its vast superiority to his own efforts that he soon after died of mortification. It has been satisfactorily proved, by the date of some pictures of Francia, that he lived some years after this, but the story has been recently repeated by Quadr想起来 du Quincly in his life of Raphael, and by Tieck (Phantasiien über die Kunst). But Francia presents no distinguished names. The summit of the art had already reached elsewhere, and his followers, who were inferior to him, were eclipsed by the disciples of Raphael.

It is by no means to be inferred that the Bolognese painters were not anxious to imitate the style of their great model into Bologna; the best were Ramenghi called Bagnacavallo, and Innocenzo da Imola. It is in the account of Bagnacavallo (which includes a notice of Innocenzo, Aspertini, and Girolamo da Cotignola) that Vasari speaks so contemptuously of the Bolognese school. Bagnacavallo was however occasionally original, and some of his productions were considered worthy of the particular attention and study of succeeding masters. Three distinguished names precede the epoch of the Caracci, Niccolò dell Abate, Girolamo da Bagnacavallo, and Niccolò dell Abate belongs strictly to the school of Modena, but he is associated with the Bolognese painters by some works at Bologna, by his joint labours with Prima ticco at Fontainebleau, and by the extravagant compliment paid to him in a sonnet by Agostino Chiesa, in which the author appears to unite all the excellences of all the great masters. Prima ticco and Tibaldi began their studies, though at very different times, under Bagnacavallo; the first, who was the elder by many years, assisted Giulio Romano at Mantua, and under his influence, although in a different style, it may be supposed which he afterwards displayed in a series of designs for the ceilings of Fontainebleau, where he was employed by Francis I. and his successors. The frescoes painted from these designs, and which are no longer in existence, are chiefly attributed to him. It was not till 1565, however, that Tibaldi soon left Ramenghi for Rome and Michael Angelo, to whose style he devoted himself; his successful imitation of the great Florentine master, whose powerful design he sometimes blended with the excellences of other schools, placed him in a relation to his prototype similar to that which Bagnacavallo holds to Raphael, and the Caracci honoured him with the appellation of ' the Reformed Michael Angelo.' Tibaldi was employed in Milan and afterwards in Spain, and thus the three greatest masters of this intermediate period were absent from Bologna a great part of their lives.

The name of Prospero Fontana stands at the head of those who, living from the earlier to the latter part of the sixteenth century, and inheriting but little of the genius of the great masters, survived their own slender reputation to the present day. As Prospero Fontana is a member of the same class as may be mentioned Passerotti, as the latest Bolognese painter alluded to by Vasari. The others may be passed over, with the exception of Denis Calvart, a native of Antwerp, who, after settling in Bologna, where he opened a school, not only instructed his pupils in the art of design, but introduced the style of landscape-painting which afterwards added a new lustre to the school in the hands of the Caracci, Domenichino, Grimaldi, and others.

Thus the schools of Bolognese and Roman masters lasted with no other change than that of increasing mannerism or insipidity, till beyond the middle of the sixteenth century, about which time the followers of
the elder Zucaro in Rome and those of Bronzino in Florence may be ranked with the Fontanas and the Passerottis of Bologna. The characteristic excellence of the Venetian school had been occasionally blended with the other styles, but the Venetian discipline and the Roman exuberance were exclusive; meanwhile, owing to the ascendancy of the two first, the imitation of Correggio can hardly be said to have extended uninterruptedly beyond his own date, since Parmigianino, who indeed rather holds the rank of an original muse, survived him but a very few years. Barocci may therefore be considered to have led the way, about 1565, not only in including Correggio among the great models proposed for imitation, but even in preferring him to the rest. The example thus set to the Roman school was followed soon after by Seghers, and however, Correggio which immediately precedes the dawning influence and fame of the Caracci, They too, from whatever cause, partook of the new admiration, and in their attempt to unite the excellence of the different schools, it was natural that a style, which had been hitherto in a great measure overlooked, should form a chief element of that eclectic perfection which was proposed as the object of attainment. Accordingly, the imitation of Correggio preponderates in the first works of these masters; and Annibale Caracci's letters from Parma prove that another painter was early furnished to the Caracci, who devoted himself to painting in order to aid him in effecting his purpose. He sent them, after well-grounded elementary studies, to Parma and Venice, from the latter of which schools it may be observed the Bolognese painters have been borrowed. The first work of importance done after their return to Bologna was a series of compositions, representing the story of Jason, in an apartment of the Palazzo Fava: Lodovico himself assisted, but the greater part was the work of Annibale. The severe criticisms and opposition which this performance excited occasioned the masters to study in the famous school which was shortly adopted almost generally by the rising painters who were studying with Denis Calvart, Cesn, and Fontana:—ample details as to the modes of study in the school of the Caracci may be found in Malvasia. The fame of these masters was soon after firmly established by their works; and Agostino, as an engraver as well as a painter, contributed to spread and sustain their name: but the eminence of the abettors of the old style was not completely silenced till the frescoes in the Palazzo Magnani have been mentioned. This Caracci had some connection with the general approbation; and it appears from Malvasia that his chief objection to the new mode of study was the constant reference to nature which was now deemed indispensable: from this objection the previous state of the school and the manner of the painters of Bologna may be inferred.

Annibale Caracci repaired to Rome shortly before 1600, and painted in various churches; but his great work, the monument of his powers, and the specimen of the school most frequently quoted, although not perhaps the most characteristic, is the series of frescoes in the Farnese palace. In this work Agostino among others assisted: the Cephalus and the Galatea, according to Bellori, were painted entirely by him. The admirers of the antique and of the Roman school are, however, confirmed in their opinion by the paintings of St. Andrea della Valle in the same city, the best specimen of his powers, and it is here that as a maestro (the term applied by the Italians to painters of large compositions on ceilings and in galleries) he aimed at the grandeur of manner and breadth of form remaining to those who had long studied in the works of Correggio at Parma.

Of the remaining disciples of the Caracci it may be sufficient to mention the names of Tiarini, Lionello Spada, and Cavedone. All the more noted scholars before mentioned had numerous followers, and perhaps none more than Guercino. In these the true character of the teaching is soon perceived. It was the Caracci; it was the Caracci that was sought in the works of Domenichino and Annibale Caracci.
About the year 1700 the greatest name was Carlo Cignani, a painter of considerable repute in his day, and who so far as we can judge was the first to divide the study of the human body with difficulty opposed by the united efforts of the Caracci, and appear to have been the chief causes of the neglect of Domenichino. This empty facility, no longer contrasted with such distinguished talents, was naturally considered the highest proof of ability, and by degrees almost extinguished the taste for well-studied imitation. A Bolognese writer and painter, Zanotti, who was long professor of the Clementine Academy, was one of the first to raise his voice against this destructive mannerism, and to recommend a more frequent reference to nature. He has been considered to have led the way to opinions far more decided as his own as to the necessity of returning to the first principles of imitation, and indeed to the methods of the earliest masters. These notions have been openly expressed in Germany in this sense, and yet art teachers in France, who by their neglect of their education in their works, have had the merit of directing the attention of the world of taste to the simple but impressive productions of the older Italian painters, from whom Raphael caught the feeling which aided him in his study of nature.

To recapitulate, the school of the Caracci has been often described as merely imitative, but perhaps this has arisen rather from the well-known and professed object of its institution than from any particular evidence of that object in their productions. If a certain resemblance of manner, whatever it be derived from, characterizes the masters, it may be admitted that no school presents so much variety as to be met with in the works of its disciples. This, it must be confessed, cannot be said of the followers of Raphael, who are of different schools, and even of a biographer of the last, who, if he sincerely suppose, had they endeavoured to follow up the feeling of Francia (not to return to Lippo Dalmasio or to Giottto), they might have succeeded in connecting the highest effort of the school with that earlier, national, or local style, which, as we have seen, is the true source of all Italian art. It is not fully developed, partly perhaps because Francia devoted himself so late in life to the art, and thus still adhered to the incomplete and, as it were, preparatory mode of imitation when the perfect one had already been introduced. The merit of this painter, as one of the characteristic Italian masters, should not however be forgotten, and his style is not the less interesting from being connected with that original school of Umbria, distinct from the Florentine, which was remarkable for purity of expression, and which had much influence on the education and genius of Raphael.

BOLOGNIAN PHOSPHORUS. [PHOSPHORUS.]

BOLOGNIAN STONE, a variety of sulphate of barytes. [BARIUM.]

BOLGH, or BELUR TAGH, a name on all our maps, down to the latest, given to the extensive mountain-range which encloses the high table-land of eastern Asia on the west, and separates it from the deep depression which surrounds the sea of Aral on all sides and the Caspian on three. This name, we believe, is first found on some Russian maps, and is supposed to have been afterwards adopted by D'Anville in his Atlas of the Chinese empire, since which time it has been continued. But as this name is not known in the countries contiguous to the range, at least not in those of which we have obtained any information, it may be considered when the above statement is found to rest on the authority of Marco Polo, the Venetian traveller, and on that of the Arabian geographer Nasir Eddin. But on examining the passages in which these authors speak of Bolor, it is evident that the name is not properly applied to this range, and it is uncertain whether it formed the source of the aforesaid. After leaving Badakhshan, or Balashee, and traversing a country called Vaccum, arrives at the highest mountains in the world, and having passed them, to the table-land of Famer. Travelling from it in a north-eastern direction, for several days, on the mountainous range, in an immense imagination, he adds that this country was called Belor. Afterwards he arrives at Khashagar. But Nasir Eddin evidently gives the name of Belor to a place which, according to his determination, lies 36° 36' E., and 10° S. of the town of Badakshan.

Mr. Erskine, in his letter to the history of the Emperor Baber (xxxv. note), was the first who observed that there was a variance between Marco Polo and Nasir Eddin, and a still greater between them and our maps. Julius Klaproth, at a later date, compared the passages of Marco Polo with the great Chinese map, and found the name of Belor inserted on it not far south of the position which Nasir Eddin has assigned to Belor. To reconcile the passage of Marco Polo with the position of Nasir Eddin and the Chinese map, Klaproth reasonably supposed that the first part of Marco Polo's route had been towards the east, and that consequently Belor and Bolor mean the same place. The opinion of Klaproth has been adopted by Ritter, and the respective positions of the places have been inserted on Grimm's 'Atlas von Asien.' As we think that this determination is well founded, and that consequently the name of Bolor will disappear from the map of Asia to which we refer, we do not describe that mountain-range which lies between 40° and 35° N. lat. on both sides of the meridian 72° E. of Greenwich under this name of Bolor, but under that of Tartash Tagh, the name by which it is known among the natives. The Chinese map gives it the name of Tartash-liing.

BOLSENA, a town in the papal state, in the province of Viterbo, situated on the slope of a hill near the northern bank of the lake of Bolsena. It is an old decayed-looking town, rather unhealthy in summer, with about 1000 inhabitants. Bolsena is near the site of the ancient Volisini, one of the principal cities of the Etruscans, which sustained several wars against Rome, and, owing to its strong position, maintained its independence after the rest of Etruria had been subdued by Rome. The civil war for the possession of the town, the property of two families, one belonging to a merchant of Perugia, and the other to the count of Cerreto, who was of the Barbadori family, was appeased by the former giving to the latter the town, which he sold to pope Benedict XII., who gave it to the commune of Bolsena, and in 1345, the pope, on the request of the commune, gave it to Robert of Florencia, count of Toscana, and turbulent of the name of Volisini, and defeated the revolted liberti, but the consul was killed in the engagement. A new consul, M. Fulvius Flaccus, was sent from Rome, who after a siege took Volisini, e.c. 265. Most of the revolted liberti were put to death, but at the same time Fulvius Flaccus razed the city which had so long withheld the power of Rome. He carried away the spoils, among which it was said there were 2000 statues, a number evidently exaggerated. (See Livy's narrative of this event, with Niebuhr's remarks on it, Rossbach's chronicles, and the history of Tuscany.) Bolsena has been on the Adriatic, but has built themselves a new town in the neighbourhood. This new Volisini is little noticed in subsequent history. Selinus, the favourite of Tiberius, was a native of it. The Via Cassia passed through Volisini. Among the few remarks of antiquity, at or near Bolsena, is the spot of a temple, said to have been dedicated to the Etruscan goddess Nusria. Two ancient urns are in the vestry of the church of Santa Cristina, and in the place before the church is another urn with curious baso-relievi, representing satyrs and bacchantes, and near it is a large and grand monument. It is in the church of Santa Cristina that the miracle of the bleeding host is reported in the old legends to have occurred, which furnished Raphael with the subject of one of his finest paintings in the Vatican. Bolsena is 56 miles N.N.W. of Rome, on the road to Florence.

BOLSENA, THE LAKE OF, is in shape nearly oval and covers about seventy square miles. It is almost wholly surrounded by hills, which are covered with trees,
vines, and gardens. To the south-east the town of Monte-
fiacccone rises on a conical hill a short distance from
the lake, from which is obtained a fine view of the
surrounding country. To the eastward, behind the town
of Bolsena, is the calcareous ridge of Bagnoarea and
Orvieto, which divides the basin of the lake from the
valley of the Tiber. [Bagnoarea.] South-west of the lake, the country opens into many buildings are situated, including the
sea. At this point, the river Marta (Lartus flumen)
issues out of the lake, and after a course of about forty
miles enters the sea near Corneto. The lake is subject to
overflows: it is in many places shallow near its borders,
where it is covered by large parts of the outer shores
of water-fowl. The air around the lake is unhealthy in
summer, though not so deleterious as that of the plains
approaching the sea. The lake of Bolsena abounds with fish
and large eels, which were celebrated in the time of
Dante. ([Purg.] v. 199.) Two small islands extend from the
lake, Isola Bisentina and Isola Martana. It was in one of
these islands, some say the Martana, and others the Bisen-
tina, that Queen Amalasunta, daughter of Theodoric, the
Gothic king of Italy, was confined, and died a violent death.
After her father's death she became regent of the kingdom,
deriving her authority from the council of the clergy and
the majority of her son Athalaric, who dying pre-
maturely, Amalasunta took for her colleague in the care
of the kingdom her cousin Theodatus, who soon after con-
fined her in the island on the lake of Bolsena, where she
was murdered by order of the king, and the island was
put to death by Vitigis. The hills that surround the lake
of Bolsena are basaltic; but the rock in most places has a
covering of rich mould, though in others it is bare and
shows hexagonal prisms ranged in all lines of
directions, very common in this place. The wine is very
good wine, both red and white, especially of the muscat
kind.

BOLSOVER, a parish and formerly a market-town in
the hundred of Seconde, county of Derby, 23 miles N.N.E.
from London, and 9 miles N. by W. from Alport. At the
time of the Domesday Survey the manor of Bolsover (Bele-
sover) belonged to William Peveril, who is supposed to have
built Bolsover Castle. Not long after the forfeiture of this
property by William Peveril the younger for poisoning Peveril, in 1187, the castle was
occupied as having been given with the manor by Richard I.
in 1189, to his brother John on his marriage. The castle was
in the possession of the barons in 1215, but was taken from
them by assault for the king (John) by William de Ferrers,
Earl of Derby. The manor and castle continued some-
times a direct property of the crown, and at other times it
was in the possession of various nobles under grants from
the crown. The Earl of Richmond (father of Henry VII.) did
possess of it in 1456, together with the Castle of Harelost,
but it was granted in 1482 in the marriage of the Duke of
Norfolk, on the attainer of whose son it again reverted to the
crown. Edward VI. granted it to Talbot Earl of Shrewsbury,
in whose family the manor of Bolsover continued until the
time of James I., when Earl Gilbert sold it to Sir Charles Cavendish. The old castle was in ruins
long before. Leland mentions it as in ruins in his time,
and no vestige of it now remains. That which is now
called the castle is nothing more than an ill-contrived and incon-
venient domestic residence with a portico and apsidal
approach in front of a castellated and apsidal tower, the
building standing on the brow of a steep hill overlooking a
large extent of country. A flight of steps on the east side
leads through a passage to the hall (the roof of which is
supported by stone pillars), and thence to the only room
decorated with a ceiling of plaster. This room is
the "pillar parlour," is 21 feet square, and has an arched
ceiling which is supported in the centre by a circular pillar,
around which the dining-table is placed. Above stairs
there is a large room, about 45 feet by 50, called the "star
chamber," formerly used as a lodging-room and now a
lodging-rooms on this floor and eight on the attic story,
which are all very small: the floor of every room is of plaster.
The residence of the family of Cavendish was probably in
the magnificent range of ruined apartments which extend to the west of the structure we have men-
tioned, and of which only the outside walls are now stand-
ing. In front of this mansion there was a fine terrace,
drawn which was a frequent feature of such houses.
The gallery in this fine range of apartments was 200 feet
in length by 22 in width; the dining-room 78 feet by 32;
the two drawing-rooms 39 feet, the other 36 feet by 33. Dr.
Pege, Horace Walpole, and others, thought these these
edifices the best in England. [Blainville.] William
Cavendish, Duke of Newcastle, son of the Sir Charles, who
built what is called the castle. Dienneck's view of Bol-
sover (1632) however decides the point of their previous
existence, and that they were built before the civil wars
is more likely than otherwise. The gatehouse at the north
of the room at Bolsover for the splendid entertainment which
the Earl of Newcastle (such was then his rank) gave to King
Charles, with the queen, the court, and all the gentry of
the county. The castle had previously entertained the king
at Bolsover, and the queen was there entertained after her
wedding. The dinner on this occasion cost 4000L.; and
Clarendon speaks of it as 'such an excess of feasting as had
scarce ever been known in England before.' In the early
part of the civil war the castle was garrisoned for the
king, but was taken in 1644 by Major-General Crawford,
who is said to have found it well manned and fortified with
great guns and strong works. During the sequestration of
the Marquis of Newcastle's estates, Bolsover Castle suffered
much both in its buildings and furniture, and was to have
been demolished, as it was of the shape and size of the
restoration. It is now in the hands of the Earl of Newcastle,
purchased for the earl by his brother, Sir Charles Cavendish.
The noble owner repaired the buildings after the Restoration,
and occasionally made the place his residence. It now
belongs to the Duke of Portland, whose family derived it
in the following way. It was purchased by a person in
1668, who shortly after died. The mansion was not still inhabited, the mansion has long ceased to be even occasion-
ally occupied by its owners.
The small town or village of Bolsover is pleasantly sit-
uated, together with the castle, upon a point projecting
into the valley which runs north and south, and is not far
east, where the separation has been made by a deep cut.
The number of houses in the parish, which includes part
of the township of Gapwell, amounted to 320 in 1831, and
the population to 1429, of whom 695 were females. The inha-
bitants are of farmer, laborer, and yeoman class. The
church, dedicated to St. Mary, is of a mixed architecture,
having portions of the Norman style intermixed with later
English architecture and with some modern additions.
The living is a discharged vicarage in the diocese of Lich-
field and Coventry, with the annual net income of 110L.
There is a small charity school, endowed with 6L. per
annum, said to have been given by the Countess of Oxford;
the school-house was erected in 1756. The interest of
nearly 3000L. do not amount, have not been devoted to the
Use of the poor. In 1623, the church was presented to the
discretion of the minister, churchwardens, and four trustees.
(Ppegge's Sketch of the History of Bolsover and Peak
Castles; Bray's Tour into Derbyshire; Peltington's Pre-
sent State of Derbyshire; Lyson's Magna Britannia.)
always be resorted to when we wish to understand the character of the Tunicata, whether simple or compound; and adds, that the naturalist who contents himself with describing the external appearance of an Ascidia may remain even more ignorant of the nature of the enclosed animal than that person is of Mollusca who knows no more of them than the shells they inhabit. The following is the generic character of Boltenia (Savigny) as reformed by MacLeay for satisfactory anatomical reasons, detailed in his memoir, every word of which is worthy of the deepest attention of the comparative anatomist.

**External character.**—Body with a conic testa, supported from the summit by a long pedicle, and having both orifices lateral and chief from four rays. **Anatomical character.**—Branchial pouch divided into longitudinal folds, surmounted by a circle of compound tentacula, and having the reticulation of its respiratory tissue simple; abdomen lateral; ovary multiple.

There are three species recorded, viz. Boltenia oncfera, Boltenia funiformis, and Boltenia reniformis. We select the latter, Ascidia globularis of Captain Sabine, *Ascidia cllata* of Otho Fabricius, as an example of the subgenus. The following is MacLeay’s character and description.

**Specific character.**—Obese, roughish; body subreniform; the orifices being somewhat prominent; peduncle terminal.

**Description.**—Envelope sub-pellucid, whitish; mantle or tunic very thin, provided with transverse, circular, narrow muscles, which cut each other very obliquely.

**Tentacula** about ten or twelve in number, very unequal, clavate, with the clava plumiform or beautifully divided into a number of regular laciniæ.

**Branchial pouch** marked with about fifteen or sixteen large folds, and having the net-work simple and regular as in the *Cynthia* monstros of Savigny. [CYNTHIA.]

**Dorsal sulcus** having the two lateral laminae winged and the intermediate simple.

**Oesophagus** descending vertically to the lower end of the body, as suspended, and there meeting an ascending ovoidal stomach without any apparent internal folioli.

**Intestine** with an oblong, longitudinal, open loop, which is prolonged to the pedicle; rectum narrow and sub-conical, and ascending nearly parallel to the oesophagus, only higher; anus having a scoloped margin.

**Liver** coating the stomach behind the right ovary, and running from the lower end of the body, as suspended, about half way up. It is divided into several granulated globes, some of which are separated from the others, particularly towards the pyraxis.

**Ovary** two, elongate, lobate, situated on each side of the body, and directed towards the anal orifice; **right ovary** straight, claviform, lying close within the loop of the intestine; **left ovary** larger and less lobate, but undulated and extending downwards behind the branchial vein.

MacLeay, after quoting Captain Sabine (Appendix to Parry’s Voyage to Melville Island) and Fabricius (Fauna Groenlandica), gives the northern seas of America as the locality of the animal. Captain J. C. Ross (Appendix to Sir John Ross’s Log. of *Voyage* of *Erebus* and *Terror*) states that the species was dredged up from a depth of seventy fathoms near Elizabeth Harbour. He observes that he can add nothing to Mr. MacLeay’s admirable description, except that the colour of the body is a very light brown; that of the pedicle darker.

The sphere wherein this Ascidian moves must necessarily be very contracted. Anchored by its pedicle, the length of its moorings fixes the limit of its motions, which are most probably confined to the oscillations arising from the agitation of the waves. Both the body and pedicle, as MacLeay observes, are scrobiculate or covered with a rough surface, which is formed by exceedingly short coarse hairs. The original colour he could not ascertain; but in spirits it was cinereous or dirty white, which, he adds, may possibly be the true colour of the animal, as it is not unfrequently that of the other ascidians. MacLeay’s specimen was brought home from Winter Island by William Nelson Grifiths, Esq., while under the orders of Captain (now Sir Edward) Parry.

**BOLTEDHEAD** a chemical vessel, usually of green glass, and of a globular form, with a narrow neck. It is chiefly employed in the process of sublimation.

**BOLTON-LE-MOORS**, a borough town in the populous parish to which it gives name, in the hundred of Saltford, county palatine of Lancaster, comprising the township of Great Bolton, and the chapel of St. John; 11 miles N.W. of Manchester, 6 miles W.S.W. of burn, 12 miles S. of Blackburn, 11 miles S.E. of Chorley, 43 miles S.S.E. of Lancaster, and 197 miles N.W. by N. of London. It is in 33° 33' N. lat., and 3° 34' W. long.

The parish of Bolton contains twelve townships and six chapelties, of which the following is a list, with the estimated annual rental of the lands, &c., of each:

- Anglezarke, township 168
- Blackrod, chapelry 2,591
- Bolton, Great, township 28,299
- Bolton, Little, township 12,896
- Bradshaw, chapelry 773
- Breightmet, township 1,936
- Edgworth, township 2,168
- Entwistle, township 701
- Harwood, township 2,011
- Lever, Darcy, chapelry 1,119
- Lever, Little township 2,231
- Longworth, township 179
- Lostock, hamlet 606
- Marriott, township 376
- Rivington, chapelry 537
- Sharples, township 2,018
- Tonge with Haughton, township 2,201
- Turton, chapelry 2,563

**Total** 63,034 £77,997

### Notes
- The increase in the population of the town of Bolton has been very rapid since the year 1773, when there were only 5,339 inhabitants in the two townships. In 1801 they amounted to 17,416, in 1811 to 24,149, in 1821 to 31,295, and in the census of 1831 they are returned at 41,195, showing an increase in 38 years of 35,856 persons. The returns for the whole parish during 50 years preceding the year 1831 exhibit a proportionate increase. In 1801 the parish contained 23,826 inhabitants; in 1811 this number was raised to 39,701, in 1821 to 50,197, and in 1831 to 63,031. The tables drawn up at the last census exhibit the following particulars connected with the population of this borough:
The boundaries of the borough, as laid down in the Boundary Act, 3 and 5 Will. IV. cap. 64, are not the boundaries of the town: a portion of Little Bolton lying to the north of Astley Bridge, and extending as far as Horrocks' Fold, is excluded from the early importance of the place, which joining township of Tonge and Haugh is included in it. The borough returns two members to parliament.

The name of Bolton is involved in obscurity, though its suffix of le Moors evidently points to a Norman origin, and an exclusion from the early importance of the place, which required to be thus distinguished from other towns of the same name. If, as it has been supposed, Bolton is a corruption of Bedolan or Bothebon, a town which is mentioned in the Calendarium Rotulorum Charterum preserved in the Tower of London, the manor belonged at the time of the Conquest to Roger de Mersheya, by whom it was sold, along with his other lands between the Ribble and the Mersey, to Ranulf de Blundeliver, Earl of Chester, from whom it came into the possession of the Earl of Ferrers, and afterwards into the possession of the family of the name of Pilkington. In the possession of this family the manor remained for nearly a century, until Sir Roger Pilkington, then high sheriff of the county, was attainted and beheaded at the commencement of the reign of Henry VII., for adhering to the cause of Richard III. at the battle of Bosworth field. His estates were confiscated and given to Sir Thomas Stanley, then created Earl of Derby. In this way the Earl of Derby became possessed of nearly all the land in the town of Bolton, which held until part of it was again confiscated by the Crown during the reign of Elizabeth. The act of the conduct of the Earl of Derby in the civil commotions of those times. By a series of mutations, not easily traced, the manorial rights became divided among several individuals, and a body of burgesses who held the town. The earls of Derby and Bradford have each one-third part, and the corporation which have each one-twelfth, and a fifth party holds the sixtieth. The manor of Little Bolton is in the possession of Thomas Tipping, Esq.

The political disensions in the reign of Charles, Bolton began to rise into notice, owing to the ardent spirit manifested by the inhabitants in favour of the Commonwealth. During the long strife between the royalists and the parliamentarians the town was garrisoned by the latter, in the year 1643. After Prince Rupert's successful attack upon the parliamentary troops who besieged Lathom House, the then residence of the Stanley family, finding that they took refuge in Bolton, he followed them with his army, where, being joined by the courageous inhabitants, he was enabled to hold the town. After several assaults the royalists, being repulsed, suffered great loss, retired, until the earl of Derby, having collected his tenantry and levied new troops, returned to the attack, and succeeded in demolishing the parliamentary forces, and obtaining possession of the town. Within the walls of this town the inhabitants remain in their hands, for by one of the singular vicissitudes of fortune, those eventful times it was again surrendered to the parliament; and after the battle of Worcester the unfortunate earl, who had signalized himself in the attack upon Bolton, being taken prisoner, was executed by a military tribunal at Chester, and sent under an escort to Bolton, where he was beheaded October 15th, 1651.

Several centuries prior to this date the town was famous for its manufactures. Leland speaks of its being a market for salt and coal; and the measure of the salt (Blithe), who wrote somewhat later, describes it as 'a fair well-built town, with broad streets, with a market on Mondays, which is very good for clothing and provisions; and it is a place of great trade for fustians.' There seems to be little doubt that the making of woolens was imported by some French clothiers, who came over in the fourteenth century; that other branches of trade were introduced by the French refugee manufacturers, who were attracted by the prosperity of the neighbourhood; and that the manufacture of cotton cloth and flax was soon followed by many of its kinds, introduced, by some emigrant weavers, who came from the cantonies of the Rhine.

Bolton made no great advances in population until the improvements in the machinery for spinning cotton gave a new impulse to the trade, which has been gradually increasing ever since. Almost the first invention in point of importance originated in this town. It was a machine which combined the principles of the spinning-jenny and the water-frame, and was called from that circumstance a Mule. This was the discovery of a man of the name of Samuel Crompton, who lived in a part of an interesting old house about a mile from Bolton called 'Hall in the Wood,' where the experiments were carried on. He was a man of great ingenuity, and made the most of the opportunities which the town afforded him. Fortunately for the public, but unfortunately for the inventor, no patent was taken out for the machine. It consequently came into immediate use, and made the fortunes of thousands, while the ingenious discoverer, after receiving the first description of the new invention, was unable to get difficulty from the persons whom his invention had enriched, was remunerated by a parliamentary grant of 5000l. In the mean time Sir Richard Arkwright, another native of Bolton, who had risen from a very obscure condition, had established large factories in Derbyshire, where he carried on the cotton manufacture in the greatest perfection. The opposition made by the labouring classes in Bolton to the improvements in machinery has, at various times, driven the most lucrative branches of employment from that town to other places. The introduction of the mule and of the power-loom was not accomplished until they had enriched other communities for some time. After a while cotton factories began to rise up in various parts of the town, filled with machinery upon the best principle. Foundries and machine manufactories followed them, and a great extension was immediately given to the trading interests of the place. Some of the largest mills in the county are in Bolton. Two of the principal spinners have each more than 100,000 spindles employed, and there are nearly fifty factories in the town. The manufacture of the woollen and worsted manufactures is carried on in these mills, comprehending the dressing and carding of the raw material, and the spinning it into yarn, employs steam-power equivalent to about 1190 horses. About fifty steam-engines are used in the spinning-machine alone, and as many in the mill. (This is Baines's calculation) there would therefore be 7700 persons, old and young, engaged in the mills alone in Bolton. But this average is too high: it would be more accurate, giving a total of the whole trade of 40,000 very considerable numbers. In 1831 the whole number of men employed in the cotton and silk trade in the townships of Great and Little Bolton was 6100. The women and children would quadruple the number.

The weavers of Bolton produce a great variety of fabrics, probably of greater variety than any other single place in the county. Plain and fancy muslins, quiltings, counterpanes, and dimities, are the chief kinds of cloth, but cambrics, gingham, &c. are also woven. Formerly fustians, jeans, thickets, and similar fabrics were the staple of the town. The manufacture of these descriptions of cloth are now chiefly produced in the power-loom, as well as calicoes and dimities. Silk goods are not produced here to any extent. Several attempts have been made to introduce them among the Bolton weavers, but without much success.

The bleachers, printers, dyers, and mercers are among the largest in the kingdom, and employ a considerable number of persons, ten millions of pieces being the average number annually bleached in the parish of Bolton. The steam-power used in these works is calculated to be equal to the power of nearly 100 horses.

In the foundries it is nearly as great, twenty-five steam-engines being employed in them. The iron foundries and machine shops in Bolton are numerous and extensive. Steam-engines are made at several of them, and, together with the machines and tools that is manufactured here, are considered of the first quality.

Many other branches of trade connected with the above are carried on to a considerable extent; and there are several large chemical and paper-works in the town and vicinity. A great proportion of the glass manufactured here is sold in Manchester, where the manufacturers have warehouses for the storing and sale of their goods. They meet their customers there from all parts of the country, one, two, or three days of each week, but always on Tuesday to Thursday, and in the case of a large polis of the cotton trade. On that day all the principals or their representatives from every establishment in the county connected with the cotton trade, more particularly bleachers and manufacturers, meet in Manchester. The practice, although apparently inconvenient, and involving with much trouble, has so many advantages that there is no wish, even among those who are most remote from the market, to alter it.
Bolton is well accommodated with the means of conveyance to all parts of the kingdom. Being on the direct line of the north road from Manchester, coaches are constantly passing through it in that direction. The intercourse with Manchester, already very easy and frequent, will be rendered more easy by the projected railway (1835) between the two towns, the completion of which is expected in the course of a year. There is also a railway, which was opened in 1831, connecting Bolton with the Manchester and Liverpool line at Kenyon, by which passengers can travel by the two coast towns in less than three hours. The distance by it to Liverpool is thirty-two miles, to Manchester twenty-two miles. The advantages of inland navigation have been enjoyed since 1791. when a canal was made from Manchester to Bolton, with a branch to Bury. It begins at the junction of the Irwell and the Mersey at Wigan, and runs through the town of Wigan, crossing the river Mersey, and arrives at Bolton near the bridge, where the canal is joined by the Irwell, to which it runs nearly parallel, crossing it at Clifton, and again near Little Lever, where its two branches to Bolton and Bury separate. Its whole length is fifteen miles one furlong, with a rise of 187 feet. The two towns thus connected with Manchester, being on the same level, no lock is required between them. The distance by canal from Bolton to Manchester is twelve miles; from Bolton to Bury six miles.

The whole district through which the canal runs abounds with coal. The mines, though not perhaps so close to the town, appear to have been worked when Leland wrote his 'Itinerary.' He says 'They burn at Bolton sum canale but more so cole, of thewich the pitte be not far off.' The principal mines for canal coal belong to the Earl of Bessborough's estate, and have been worked for many years. The inferior quality is found nearer Bolton. The common coal lies round the town, and is the main source of its prosperity.

The two townships of which the borough of Bolton consists are separated by a small river called the Croe, which rises in the Irwell valley, and makes a bend west into the Irwell, dividing in its course Great and Little Bolton, the south side of it being the township of Great Bolton, and the north side the chapelry of Little Bolton. Though an ancient town, the streets of Bolton are wide and straight. The houses of the better class leading to and from the town in every direction are kept in good condition, and the principal entrances are good. The town covers nearly a square mile, having been very considerably extended in the S.W. direction, under an act of parliament obtained in 1792 for inclosing Bolton Moor, a large tract of waste land comprising nearly 300 acres, which was divided into allotments and sold by public auction on a perpetual chief-rent to be secured by buildings, and made payable to trustees as mentioned in the aforementioned act. A fifth of the chief-rent is secured to be paid to the owner of the manor, to whom were reserved also the mines and minerals underneath the surface. The powers of these trustees were extended by another act in 1817, by which they were empowered to raise a rate to the amount of 2s. 6d. in the pound on all the houses of the town for the purposes specified in a former act for lighting, cleansing, paving, and improving the town of Great Bolton. The many expensive improvements which were made previous and subsequent to the passing of the last act involved the trustees in expenses beyond the amount of their annual receipts from the Moor, which, united with a want of proper economy, rendered it necessary for them to get an enlargement of their powers, in order to obtain a mortgage upon the Moor rents. In this way they raised 12,000l. to defray the increased expenses, which were mainly paid for by a cess amounting to 2s. 6d. in the pound, which was annually laid upon the inhabitants, and paid for a number of years, until, in the year 1835, the tax was discontinued, and by a better administration of the funds yielded by the chief rents on Bolton Moor, not only have they been found equal to defray the annual disbursements for the lighting, paving, cleansing, and improving the town, but, in addition, 2000l. of the debt has been discharged. The income of the whole property is 2500l., and 400l. is of which is absorbed by the interest of the debt. The powers of the trustees of Great Bolton, who are appointed under the Police Act, do not extend to the preservation of public order. Officers are annually selected at a court leet called by the lords of the manor, in each township respectively, under the names of a boroughreeve, two constables, and a deputy constable, in whom all authority is vested, during their continuance in office, for the preservation of the public peace. The consequence of this mode of appointing such important officers is the same as in most other towns similarly situated,—a most inefficient police—an evil which is so strongly felt by the inhabitants, that it is likely they will seek to remove it by incorporating themselves under the Municipal Act, which is now in operation. Little Bolton has a police act distinct from Great Bolton, which vests the appointment of a certain number of trustees annually in the rate-payers. The sum raised last year for the purposes of lighting, paving, and cleansing Little Bolton amounted to 181l., being 1s. 6d. in the pound upon the annual value. The parochial concerns of the two townships are each as separate as their municipal affairs, and in both are well managed. In Great Bolton, the sum collected for the relief of the poor was about 400l., being 2s. 6d. in the pound. In the preceding year, the same sum was collected. During the same year, 1674l. 6s. 10d. was collected for the relief of the poor, being 1s. 6d. in the pound upon the annual value of the property in the township.

The town is well lighted with gas by a company incorporated in 1820. It is also admirably supplied with water, brought from a distance of four miles N.E. of the town. The springs are first collected in a large reservoir near their source, from which the water is conveyed in earthenware pipes into another reservoir, about a mile from the town, from whence it is conveyed by two canals, each of about fifteen inches diameter, to various parts of the town. The water descends from an elevation of about 700 feet; but the elevation of the reservoir from which the inhabitants are supplied is not more than eighty feet, and is not found to give sufficiency of pressure to reach the highest house. The water, of which it is wanted. The company are about to remedy this, by making another reservoir on a higher level, which will make the water available to all the purposes for which it is required. This undertaking was effected at an expense of 40,000l., and the general rate of 1s. 6d. in the pound is established by act of parliament in 1824. The scale of charges is so moderate as to put it within the power of the poorest inhabitants to have the water brought into their own houses. Dwellings under 10l. are charged 10s. a year, and dwellings of greater value one shilling in the pound upon the annual rent.

The churches and chapels, the exchange, news-room, and library, the dispensary, the workhouse, and the town-hall in Little Bolton, are the only edifices that can be considered as public buildings. Of these the oldest, dedicated to St. Peter, is supposed to be several centuries old, but has few pretensions to architecture. It has a low tower, and is surrounded with a very extensive burial-ground. The living is a discharged vicarage in the deanery of Manchester, in the bishopric of Chester, and is part of the vicarage of St. George's, and is returned of the yearly value of 464l. in the Ecclesiastical Returns. Another church was recently erected in Great Bolton, at an expense of 13,412l., part of which was defrayed by a grant from the parliamentary commissioners. It is noticed among the English-Gothic style, and contains 925 free sittings. The living is a perpetual curacy in the gift of the vicar of Bolton. The largest church in Little Bolton, St. George's, a brick building, with a tower and bells, was built by subscription in 1796. The living is a perpetual curacy, to which the subscribers had three presentations, which are now exhausted, and it reverts to the bishop of Chester. There is also a chapel of ease in the same township, dedicated to All Saints, in the gift of Thomas Tipping, Esq., of the manor of Reddish, and of which the vicar is the perpetual curacy. It is endowed with 200l. of private benefaction, 200l. royal bounty, and 2200l. parliamentary grant. The places of worship belonging to the dissenters in Bolton are numerous and spacious. There are two each for Baptists, Independents, and Unitarians, one each for the Society of Friends and Swedenborgians, a Roman Catholic Chapel, and seven places for the various denominations of Methodists.

The institutions for education in Bolton are numerous. The free grammar-school, contiguous to the parish churchyard, educates 120 boys. It was founded in 1641 by Robert Lever, citizen and clothier of London; and in 1651 an old school, of unrecorded foundation, was, with its revenue and property, united to it; since which time both have been considered as one school. The income is 468l. per annum, of which the head master receives a salary of 180l., the second master 100l., and the writing-master 75l. per annum.
The appointment of masters and the government of the school are vested in twelve governors, who supply vacancies in their number as they occur. No boys are admitted into the school above the age of seven, and all are sent from the parish of Bolton. The children of dissenters are admitted if they are willing to conform to the rules of the school. The only payment is one shilling on entrance to the head master, who superintends the whole school, and has a right to all the fees paid. The boys are instructed in the Latin and Greek. In the lower school the second master teaches English, geography, and the rudiments of Latin. The boys both in the upper and lower school attend the writing-master, and receive instruction according to their capacities in writing, arithmetic, music, &c. Latin is not taught in the middle school, and French has been discontinued. The boys learn the Church Catechism and read other religious books, principally selected from those published by the Christian Knowledge Society. Among the masters who have presided over this school are Royle, Atkinson, the compiler of the Latin Dictionary, and Dr. Lemperiere, the author of the 'Classical Dictionary.'

At another school, endowed by Mr. Nathaniel Hulton, in School-street, Moor-lane, 120 boys and 80 girls are instructed in reading, writing, arithmetic, and geography, and the girls in sewing, on the system of the British and Foreign School Society. It was not founded by the testator, but established in 1794, by his trustees, in compliance with his will, out of the surplus proceeds of money bequeathed for that purpose. Duke York's children pay a small sum weekly towards their education.

Marsden's and Popplewell's Charity-school, in Churchgate, was founded in 1714, for teaching twenty children, boys and girls, reading and the church catechism, without pay. Since 1819, the school has been conducted on the same plan, and has been conducted on the same plan as the other charity-schools mentioned. In 1843, it was increased to a school for thirty-two in the same manner, and another considerable bequest has been received from the executors of the late Mr. Popplewell, which will soon render it desirable to place the school in a situation more adapted to the accommodation of the pupils. (Report of Commissioners concerning Charities, pp. 155-175.) The number of private day-schools in Bolton is about eighty; of which forty-four are for children between the ages of three and nine; fifteen for girls only, from five upwards; seven for boys only, of the same age; and the rest for pupils of both sexes, between the ages of four and twelve. The number of children educated in Sunday schools is very considerable, as may be seen from the following statement, taken with some of the above particulars from the Journal of Education (No. xxviii. p. 74):

Besides these institutions, funds are raised for the establishment of two new schools, one in each of the townships, on the system of the British and Foreign School Society, for the education of a thousand children, 600 boys and 400 girls.

In addition to the school charities considered sums are distributed to the poor from various bequests connected with the town. From Hulton's Charity, 25l.; Parker's, 5l.; Gossell's Charity, 5l.; Crompton's Charity, 7l. 10s.; Astley's Charity, 5l. 12s.; Ashley's Charity, 5l. 15s.; Morley's Charity, 5l. 15s.; Mort's Charity, 1l.; Lomax's Charity, 12s. 6d.; Greenhalgh's Charity, 4l. 10s.; and Popplewell's Charity, 3ol. (Report of Commissioners concerning Charities, 1828, pp. 168-184.)

The Charity was established in 1814, and is liberally supported. A clothing society, and a society for the relief of poor women during child-birth, are supported chiefly by ladies.

Petty sessions are held on Monday and Thursday in each week, which are attended by several magistrates, the business of which has undergone a most extraordinary diminution since the Poor-Law Bill came into operation.

There is a large weekly market on Mondays and Saturdays, and a fair on the 31st of August, and the other on the 4th of October, for hardware, toys, &c., and on the day preceding each is a fair for horned cattle. A fortnight fair is also held for cattle on Wednesdays, when there are classes for the examination of cattle, and a prize is awarded under the title of 'The Bolton Chronicle,' is published every Saturday. (Communication from Bolton.)

BOBM, the original name of what is now called a shell, is a hollow globe of iron, which, when charged with a certain quantity of gunpowder, is fired. It is generally fired at a considerable distance, and is used by the infantry, generally at a considerable angle with the horizon; in order that, by the moment acquired in its descent, it may crush the roofs, and, by exploding, destroy the buildings on which it may fall. The name is thought to have been given as an expression of the sound, produced either in its explosion, or at its discharge from the piece of artillery employed to project it.

It is said by Strada, in his account of the wars in the Low Countries, that bombs were employed for the first time in 1558 by Ernest, the father of Charles, Count of Mansfeld, at the siege of Wachtendonk, a town near Gelders. He adds that they were invented, a few days before that siege commenced, by an inhabitant of Venlo; and it is stated that the people of this city, wishing to exhibit the invention in presence of the Duke of Guelders, fired a bomb, which, falling on one of the houses set fire to it, and, the flames spreading, three fourths of the town were destroyed before they could be extinguished. (Père Daniel, Histoire de la Milice Française, liv. vii. ch. 6.) But Grose relates that the bomb was invented in 1545, of a work by Valturinus, was accompanied by a print representing a cannon just fired, with a ball in the air and another on the ground, both of which were burning at the vent. A title to the print denoted that this was a contrivance for firing a ball filled with powder; and as the first edition of Valturinus is dated 1472, it appears from thence that bombs must have been invented about the middle of the fifteenth century. Blondel however, in his treatise entitled L'Art de Jeter les Bombes, remarks that bombs were used by the French for the first time in 1534, at the siege of La Motte, under the direction of one Malthus, an English engineer, who was invited from Holland by Louis XIII., and was afterwards killed at the siege of Gravelines.

In 1688 there was cast in France an enormous bomb, which is said to have been in the shape of an egg, and to have been capable of containing 7000 or 8000 pounds of powder; it was nine feet long and five feet in diameter, and the iron was six inches thick. The bomb was to have been discharged against the Algerines, and the ship in which it was intended to be blown up with it. It was not however employed, probably in consequence of an opinion that it would not have had the intended effect, and no attempt has since been made to project such an immense mass of metal. While the Citadel of Antwerp was besieged by the French army in 1633, shells twenty-four inches in diameter were thrown from the largest mortar which has been employed in modern warfare; the shell or bomb was capable of containing ninety-nine pounds of powder, and when charged weighed 1015 pounds.

The word bomb is now being now except as a component in those which express the subjects of the three following articles, and in the term bombardier, which is applied to the soldier whose duty it is to serve the ordnance from which shells are projected, the description of this missile will with most propriety be introduced under the words which denote the different species at present in use: as CARCASS, CASE-SHOT, GRENADE, and SHELL.

BOMB-PROOF. This term is applied to a military magazine, or other building, when its roof has sufficient thickness to resist the bursting of shells, either when being fired from mortars at considerable elevation. Under the word BOMBAGE is given the construction of such buildings of timber as are intended to secure troops or ordnance from the effects of what are called vertical fires; and under CASEMATE are comprehended those works, which are formed in the masses of ramparts to serve for the like purposes. A bomb-proof, however, is generally understood to signify an isolated building, rectangular on the plan, formed of brick or stone and covered with a vaulted
of the same material. The intrados, or interior line, in a vertical and transverse section of the vault, sometimes forms a semicircle, but now more generally, a parabola; and the exterior surface of the roof has the form of two inclined planes meeting in a ridge which is parallel to the sides of the building and over the middle of its breadth. By this construction the vault is intended to be water-tight, or, upper part, where a falling shot or shell would be most injurious to the stability of the vault. It is intended to serve as a powder, or store-magazine, an hospital, or to cover a battery of guns or mortars; and when constructed in a fortress for the first time, it should not only be isolated, but should also be situated some spot at a distance from the fronts likely to be attacked, and secured as much as possible against accidents. As the details of the construction and uses of such buildings are necessary, it is necessary to observe here, that the span, or internal width of a bomb-proof vault, is usually about eighteen feet, and the thickness of the arch three feet at the heads or sides. But the extrados, or exterior of the vault, should be covered with a bed of earth about five or six feet deep, to deepen the concussion produced by the shells which may strike it; this earth should be renewed as fast as it is blown away by the explosions, to prevent the shell from falling on the naked vault, for, as each shell would tear off the masonry to a depth of two or three inches, it is evident that the building would be totally destroyed after a few successive shocks.

BOMB-VESEL, a ship of about 350 tons burthen, usually forming part of a fleet intended by a bombardment to destroy or to compel the surrender of some town situated on the coast. It varies from 150 to 250 long tons; 18-pounder mortar, besides 6-pounder guns, one 12-pounder, and eight 24-pounder carronades; the crew consists of sixty-seven men, with the usual complement of officers for ships of the same class, besides a detachment of marine artillerymen with their officers, for the service of mortars and mortars. The mortars are mounted on their beds, which are placed on traversing platforms in the middle of the gun-deck, and they may be fired over either side of the ship at an elevation never less than 45°. As to the protection of the structure, it is desirable that the vessels should keep beyond the range of the enemy's batteries, and that they should have springs upon their cables.

For particular concerning the ordnance and stores on board of bomb-veesels, and for the management of the latter when in action, see the British Gunnner, by Captain M. Spearman.

BOMBA/CHEE, a group of plants considered by some a distinct natural order, by others as a mere section of Sertulacidae. They are usually large trees, with broad deep-green leaves. The commonest of the genus differ from Tricræaee in having two cells to their anthers, which are often doubled down upon themselves, in their calyx opening in an irregular rather than a valvate manner, and in their stamens being usually collected into five parcels. Their anthers are often described as containing only one cell; but this is an inaccurate mode of speaking of them, inasmuch as they are formed upon the common twincelled type, and merely have the cells united at the point of the respective petals.

This contains some of the most majestic and beautiful trees that are known, but nothing of much medical or economical importance is furnished by them. Their wood is light and spongy; the long cotony substance found within their fruit, and which has gained for small feathers, and has the power of destroying the staple to be manufactured into linen; and the slightly acid or mucilaginous qualities that occur in the group are altogether inferior to those of many Tricræaee. Adenanthera, or the Bocb tree, already mentioned in its proper place, is one of them.
It is said that the excessive size of its trunk as compared with its height, and this is a character of common occurrence. Several American species spread enormously near the ground, forming huge buttresses with the angles of their trunk. This is especially the case with the genus Engleriana, which is frequently seen in very large conical prickles, which do not fall off till they are exfoliated by the gradual distention of the trunk. Among these plants is a singular instance of a flower resembling the paw of some animal. The tree which produces so strange a conformation is called the Menila, and will be described under CHEIROSOMMON. No bombaceous plants are found far beyond this element.

BOMBARDIER, a non-commissioned officer of the royal regiment of artillery, whose duty it is to load shells, grenades, &c.; to make and fix the fuzes, and who is particularly appointed to the service of mortars and Howitzers. A certain number of bombardiers are attached to each company of artillery.

BOMBARDMENT. This is the action of throwing shells, carcasses, and shot into an enemy's town in order to destroy the buildings, and chiefly the military magazines; for which purpose mortar, howitzer, and gun-batteries are constructed in convenient situations, generally opposite to the most densely inhabited quarters. If the town is a sea-port, bomb-vessels also are moored along the shore, and the fizing is kept up simultaneously on the land and sea-sides of the place.

When an army invests a fortress, whether it proceed against it by the operations of a regular siege, or simply keep it in a state of blockade, a bombardment is one of the means resorted to is order to accelerate the surrender, by rendering its occupation dangerous to the citizens, and ruining the buildings in which they are accustomed to reside, or in which the garrison while not on duty find repose.

Among civilised nations it has become a principle to spare as much as possible the lives and property of individuals who are not actually engaged in the military service of the state, or who by reason of their situation are not subject to the cruelty of acting otherwise, the end thereby to be gained, which is the final termination of hostilities, is not in the smallest degree advanced. The practice of besieging fortresses is now so far reduced to a regular process that the putting of them in a state of total submission is at present the sole object of the engagement, by employing the artillery, that, while it effectually dismounts that of the enemy, and lays the rampart in ruins in the ditch, it scarcely produces the smallest injury to any but the defenders of the works; hence the simple bombardment of towns occurs so much less in modern times, and no circumstance is considered as a justification of the measure except the absolute inability to reduce a place by other means.

When a nation is, from the war of about to become subject to a bombardment, the garrison should endeavour to retard the calamity by the erection of advanced works about the place, or by keeping troops in the suburbs and neighbouring villages as long as possible. By this measure provisions, materials, and even workmen will be in abundance for the service of the defenders; the inhabitants of the fortress also, finding that the garrison is not shut up within the walls, will be inspired with confidence in its protecting power, and thus induced to suffer less unwillingly the privations and dangers to which they must inevitably expose themselves by a continued state of siege, either to abstain from constructing a line of countervallation, as it is called, to prevent the sorties of the garrison; or, if such is attempted, the line must be so extensive as to require a long time to its formation, so that the workconstitutes it must be so far as possible as to render it impossible to watch the avenues of the place with sufficient care to prevent all communication between the town and country. The power of acting offensively may thus be not wholly taken away from the garrison, and the enemy may be kept at such a distance as to lessen materially the effect of the bombardment. What has been said must not be understood to imply that any village, suburb, or building, which, by falling into the power of the enemy, might facilitate his operations, or which might be turned into a fortress, or which might be useful as a means of communication, should be destroyed; but it is evident that the object in view, which is the preservation of the place, and of its docks and arsenals, if it be a naval station, will be most effectually obtained by keeping the enemy as long as possible at a distance from the beyond the range of this artillery.

The garrison must of course employ a fire of the heaviest artillery to destroy the enemy's batteries as soon as they are formed. The casemates and blinded buildings in the town should be repaired and multiplied; and the ammunition should be kept in small quantities to hand in, to keep down the loss and damage which would be occasioned by the explosion of a large and full magazine; for which reason also, it should be disposed in the quarters least subject to the fire of the enemy. Wells and cisterns should be protected by shell-proof blinds, the fire-engines carefully secured, and companies of men formed whose duty should be to
proceed immediately with the engines to any spot where a fire may have broken out. The utmost intrepidity is re-
quired in men employed on this service, which is rendered particularly dangerous, because the enemy always continued to
direct his fire towards any spot at which flames are seen to rise, in order to prevent such places from being extended.
When red-hot shot are thrown into a town, men should also be appointed to seek them and, by pincers or otherwise, remove them to places where they can do no harm.
A strict police is to be maintained, and every precaution used to prevent conspiracies among the citizens for deliver-
ing up the place. For now, since the loss of a town does not, as in ancient warfare, entail upon the inhabitants the loss of life or liberty, it is easy to conceive that their interest in their property must be very powerful, and they may be induced to destroy an enemy, though at the price of the transfer of the town to the enemies of their country; and it must be expected that they will use every means in their power, whether of persuasion or force, to compel the com-
mander to surrender.
The most celebrated bombardments mentioned in history are those of Gibraltar, Copenhagen, and Algiers. The first of these places was invested on the land-side by a Spanish army, which was afterwards united to that of France, and on the sea-side by the combined fleets of the two nations. The investment took place in 1779, but no remarkable actions occurred till 1782. The town was twice distressed for want of provisions; the highest works of the fortress, though 1340 feet above the level of the enemy's batteries, were destroyed by shells from the latter. The town was, however, defended by the ships in the harbour, and to enorrow the British army by gun-boats.
On the other hand, the garrison was employed in strengthening the old fortifications and adding new bat-
teries, and in making occasional sorties against the Spanish land army. In the last mentioned year, however, the besiegers converted some of their large ships into floating batteries, which, on September 13, commenced a tremendous fire on the town, while the land-batteries cannonaded the works in flank and rear; the garrison, in return, paying little attention to the threat, continued to send fire from the batteries, binding fire of carcasses, shells, and red-hot balls. This work of destruction continued on both sides till about seven or eight p.m., when it nearly ceased. The utmost confusion and distress by this time prevailed in the fleet of the besieger; several of their largest ships caught fire, and two of them blew up with tremendous explosion. The general peace, which was made in the beginning of the next year, put an end to this memorable siege after it had been carried on nearly four years.
The bombardment of Copenhagen took place in 1807, and was effected by a British army under Lord Cardon, which closely invested the city on the land-side, while the fleet under Admiral Gambier blockaded the harbour. The first attack of the batteries took place on the evening of September 2, and continued till the night of September 4, when a capitulation took place. In this bombardment the rockets invented by Sir William Congreve were used for the first time, and it is said that the cathe-
dral, with above three hundred houses, was destroyed by the shot and shells which were thrown into the town. The last action of this nature occurred in 1816, when the united fleets of England and Holland, consisting of fifteen ships of war, besides gun-boats, under the command of Lord Exmouth, bombarded the town of Copenhagen, on the evening of September 2, and continued till the night of September 4, in which time all the enemy's ships in the harbour were destroyed and great part of the town.

BOMBAY, an island on the western coast of Hind-
dustan, lying off the shore of the Concan in the province of Malabar, which is at the south-eastern ex-
tremity of the island, is in 18° 56'. N. lat., and 72° 57'. E. long. It lies to the south of the island of Salsette, which is considered to be a dependency of Bombay; the two islands are connected by a causeway which was constructed in 1805 by Mr. Duncan, at that time surveyor general.
Bombay is little more than eight miles long from north to south, and about three miles broad in its widest part. It is formed by two ranges of whinstone rock of unequal length, running parallel to each other on opposite sides of the island, and at the distance of between two and three miles from each other. The eastern range is about seven and the western about five miles long; and they are

united at the north and south by belts of sandstone which are only a few feet above the level of the sea. The in-
terior of the island was formerly liable to be flooded so as to give to the whole the appearance of a group of small islands. This flooding is now prevented by the construction of mounds of earth raised over the spring-tides, but as the lower parts of the island are ten or twelve feet under high-water mark, a great part of the interior is, during the rainy season, reduced to a swamp. The site of the new town of Bombay is subject to this class of inconvenience, so that the wet monsoon the houses are separated from each other by water sometimes for seven or eight months of the year: this spot was recovered from the sea in the latter part of the last century.
The narrow difficulties of the island must have prevented any settlement upon it by Europeans but for the advan-
tages of its position for commerce, and its harbour, which is unequalled for safety throughout the British Empire in India. This excellent harbour, on account of which the island received its name (Bomb Bahia) from the Portuguese, is bounded on the north and west by the islands of Salsette, Bombay, and Colaba, or Old Woman's Island, which last is a small island or narrow promontory, naturally connected by a mass of rock, which rises near the surface of the water, with the south-west extremity of the island, and is protected by a causeway which is overflowed at spring-tides. The cantonments for the European troops are situated on Colaba. On the east side of the harbour, about four miles from Bomb-
ay, is Butcher's Island, and behind this the island of Shipwrecked Island, from which the name of Bombay has just mentioned and a reef of rocks surrounding on all sides the point of Colaba, and extending about three miles to the southward. The channel between these is about three miles wide, and seven to eight fathoms deep. In entering this channel the bar, which is the extreme of a sand bank which occur in the passage. There is a light-house built on the southern extremity of Colaba Island, 150 feet above the level of the sea, which may be seen seven leagues off the coast.
There is no other important harbour in British India where the rise and fall of the tides are sufficient to admit the formation of wet docks: the rise at ordinary spring-
tides is fourteen feet: occasionally it is three feet higher.
In the age of the Periplus this island, then called Kali-
ka, was frequently visited by Egyptians. It was called previously an established commercial port, but Sandaxa, one of the sovereigns of Barugaza, prohibited any of the Egyptian trading vessels from entering the harbour, and if any were compelled to do so by accident or stress of weather, a guard was immediately put on board, and they were taken to Barugaza.
Bombay was ceded by the Moguls to the Portuguese in 1530, and came into the possession of the English on the marriage of Charles II. with the Infanta Catherine of Portu-
gal. By the marriage-contract the king was to receive 450,000l. in money, the town of Tanag, in Africa, and the island of Bombay with its dependencies, together with per-
mission for his subjects to carry on a free trade with all the Portuguese settlements in India and Brazil. A fleet of sixty ships and 1500 soldiers, commanded by the earl of Marlborough, with 500 soldiers on board, was sent from Bombay, where they arrived on the 18th September, 1662. Under the pretext that the instrument by which the sou-
reignty of the island was made over did not accord with the uses of Portugal, but, really, as it is said, instigated by the priests, who could not endure the thought of surrendering the place to heretics, the Portuguese governor refused to complete the cession, and the fleet returned to England. This matter was not arranged between the two governments before the end of 1664. It was not until 1669, when the king of England by Mr. Coke's advice, that a visit was paid to Bombay, which was then in the possession of the English. The trade carried on from this settlement by officers in the king's service, who paid no freight for the goods which they covered from the native princes, was reduced to a small sum; to undersell the factors of the East India Company, caused great dissatisfaction on the part of that corporation; and on
According to a valuation made in 1813 the buildings within the walls were worth rather more than one million sterling, and the rent of houses, including the annual value of the company's buildings, was 27,736.

Since the first occupation of the island by the English, its resident population has increased more than tenfold. At that time it amounted to about 15,000. In 1716 the number was 16,000, and in 1816, 161,550, divided into the following classifications: for its defence and government. Bombay is therefore the oldest of the East India Company's settlements in Hindustan, and the terms upon which it was acquired first invested them with that political power which they have since exercised in India. In 1674 a small number of Bombay residents were very easily repelled, when the ringleaders were tried and executed, the Company then first exercising the power of enforcing martial law. Another insurrection in 1683 was not so easily quelled. The commander of the troops, dissatisfied with the proceedings of the Company, and being joined by the soldiers as well as the great body of the settlers, denounced the authority of the Company, and by a proclamation dated Dec. 27, 1683, declared that the island belonged to the king. This proceeding was not approved by the crown, and orders were sent to deliver the island to the officers of the Company, who were directed to proceed by force to their execution. It was only under the promise of free pardon to all the insurgents that possession was regained, and at this time it was deemed expedient to guard the island with a very small force, referring to Bombay the seat of the Company's government in India, which had previously been placed at Surat. In 1687 the title of regency was given to the administration as regency, and unlimited power over the rest of the Company's settlements.

The only natural vegetation of the island, with the exception of some rank grasses, was the cocoanut tree, which grew very abundantly, and being a property of the soil, was not injured by sea-water. It was necessary to clear away the trees of this group in order to erect the fort and buildings of the town. The spots capable of being cultivated in the island will hardly yield a week's supply of provisions for its inhabitants, who are dependent upon the farmers and gardeners of Salsette, which is well cultivated.

The fortifications are extensive, and would require a numerous garrison for their defence; towards the sea the works are extremely strong, but on the land-side, assuming as do most of the children of the soil that they would offer comparatively little resistance. The houses within the walls are built of wood, with verandahs and sloping roofs covered with tiles. In 1803 a great fire destroyed many houses; after which a great number of dwellings were destroyed. In 1816, the fort covered an area of 300. The cylindrical buildings, each twenty-five feet high, the interior of which is built up solidly with masonry to within five feet of the top, with the exception of a kind of well fifteen feet in diameter in the centre. The boles are deposited between this well and the wall, and being only loosely wrapped in cloth, are speedily devoured by vultures, many of which are always to be observed hovering about these charnel-houses. From time to time the bones are thrown into the well in the centre, from the bottom of which they can be removed with difficulty. Many of the tombs in the island, all of which are from two to three miles distant from the fort: the more wealthy of the sect have private tombs of similar construction.

The docks within the fort, although the property of the East India Company, are entirely under the management of Parsees, by whom merchant-vessels of 1000 to 1200 tons burden, frigates, and even line-of-battle ships are built. These docks were about twenty-five years ago enlarged and improved under the superintendence of Major Cooper of the 44th Engineers, and are now built of the best materials in all proportions; this building is said to have been formerly a church belonging to the Jesuits, from whom it was purchased by the Company.

Niebuhr remarked that the temperature at Bombay was very unhealthy from the sea-winds and the quantity of rain that falls in the wet season. He admits that many Europeans died suddenly, but he attributed this nearly altogether to their injudicious mode of living.

The barracks, arsenal, and docks are all within the fort.
being employed as traders during fourteen or fifteen years, have been bought by government and added to the naval force of the country, being then considered much stronger than newly-built European vessels. From the cheapness of labour, ships may be built at Bombay for three-fourths of the cost in England. The Minden, a seventy-four gun ship, which was launched at Bombay in 1816, was constructed entirely by Parsees, without any assistance from Europeans, and since that time several frigates and line of battle ships have been built at these docks.

In addition to its trade with Europe and with China, a very great traffic is carried on by coasting-vessels with all the ports on the western side of India, from Cape Comorin to the Gulf of Cutch. The vessels thus employed vary in size from ten to near twenty two tons burden, and nearly 800 of them are registered belonging to the port. The articles which form the principal part of this trade from Bombay are European manufactures and the produce of Bengal and China, the returns being made in cotton-wool and cloths, timber, oil, and grain from the northern ports, and from the south, cotton, hemp, coir, timber, pepper, rice, and cocoa-nuts.

The merchandise thus brought to Bombay is in great part re-exported in larger ships to different parts of Europe, to North and South America, to Canton, to the Arabian and Persian Gulfs, and to the Bay of Bengal. The value of this export trade during three years ending with 1831-32, as far as relates to Europe and America, was as follows:

<table>

Through these channels Bombay receives from Persia raw silk, copper, pearls, golds, coffee, gum-arabic, copal, myrrh, olibanum, balsam, assafadot, dried fruits, horses, wool, leather, and muslin. The returns are grain, Bengal and China sugar, British manufactured goods, cotton and woollen, and spices. The merchandise sent to Calcutta from Bombay, in return for sugar, indigo, and rice, are timber, coir, cocoa-nuts, sandal-wood, and cotton.

The heavy duties levied by the Ameers of Seend, at the mouth of the Indus, together with the unsettled state of Afghanistan, have reduced the inland commerce of Bombay with Central Asia to a comparatively trifling amount. The little trade now carried on between those quarters is conducted by means of a tedious and expensive land route through Surat.

Among the mercantile establishments conducted in
Bombay is an insurance company with a capital of 200,000l. sterling.

The seamen from the port of Bombay are considered to be the best among the natives of India. It is usual for ships of considerable burthen to be under the charge of European commanders and officers.

The western coast of India are infested by numerous piratical vessels, and to keep these in check it has been necessary for the East India Company to maintain a considerable naval force at this station. The expense of maintaining this force is included among the charges of government in the Bombay presidency, and this forms one among other reasons why its revenues are invariably so greatly below its expenditure. The navy is thus maintained, not for the exclusive benefit of Bombay, but for the protection of an extensive and profitable commerce from which every part of British India derives benefit.

The travelling distances between Bombay and the most considerable cities and towns in India are given by Major Rennell as follows:

- Ajmere, 650 miles; Allahabad, 977; Ahmedabad, 321; Ahmednuggur, 181; Aroor, 722; Aurungabad, 260; Baroda, 221; Bassein, 27; Bednore, 452; Bijanagar, 398; Calcutta, 1301; Canore, 889; Cashmere, 1233; Cuttuck, 1034; Cochin, 780; Delhi, 880; Dowlata, 238; Goa, 292; Golconda, 475; Gwalior, 765; Hyderabad, 480; Jugger, 1296; Indore, 456; Lahore, 1610; Locknow, 953; Madras, 758; Masulipatam, 686; Mysore, 952; Moosrabad, 1259; Moutlan, 920; Mysore, 630; Nagpur, 532; Oude, 1013; O CGI, 486; Patna, 1145; Pondicherry, 805; Poonah, 98; Seriapadum, 628; Sumbhore, 1177; Surat, 127; Teilcherry, 612.

BOMBAY, PRESIDENCY OF. Bombay is the seat of one of three presidencies into which the British empire in India is divided. Together with the presidency of Fort Saint George, or Madras, it is subordinate to the Governor-General of India, whose residence is in Calcutta. The territory under the immediate jurisdiction of the governor and council of Bombay is situated between the 14th and 24th degrees of N. lat. and the 71st and 77th degrees of E. long., and comprehends the following districts:

- Ahmedabad,
- Kaira,
- Surat,
- Baroda,
- Bombay Island,
- Darwar,
- Candia,
- Northern Cancon,
- Southern Cancon,
- Poonah,
- Ahmednuggur.

The following statement of the extent and population of the districts comprehended in the presidency of Bombay was given in evidence before a committee of the House of Commons which sat in 1831, to inquire concerning the affairs of India.

The table above is exclusive of the district of the Northern Cancon, where there are no returns; its area and population are estimated at 5,500, 387,264.

Among the population thus stated, which is composed of different races of people speaking different languages, and who, up to a recent date, have lived under different systems of religion, laws, and government, the greatest variety must necessarily exist. The number of resident Europeans in this presidency is smaller, when compared with its area and native population, than the number of Europeans in Bengal and Madras.

On the subject of education, the same general remarks as are made in regard to Bengal (vol. iv. p. 233), apply equally to Bombay. By a recent report from the Sudder Dewanee Dewulti, it is stated that in the British territory dependant on Bombay there are 1705 schools, at which 35,153 scholars were receiving instruction. Twenty-five of these schools, containing 1315 scholars, were maintained by the government of the company, and the remaining 1580 were village schools, with 22,889 scholars. The proportion of the population attending upon the schools is thus shown to be exceedingly small, besides which it may be said that the village-system of education is of the lowest description, and the same that has been handed down from time immemorial. The books read are some silly stories, and the writing acquired goes little beyond the ability of signing the name.

The sums annually chargeable on the revenues of India for the support of native schools within the presidency was thus given in 1832, from the records of the comptroller-general's office:

- Bombay school | 3,600 rupees
- Society for Promoting the Education of the Poor within the Government of Bombay | 11,385 rupees
- Bombay Native School-book and School Society | 12,720 rupees
- Native School Society, Southern Cancon | 500 rupees
- For the education of natives on Capt. Sutherland's plan | 4,800 rupees
- Dhukans, in the Deccan | 50,000 rupees
- College at Poonah | 15,250 rupees
- Engineer Institution at Bombay | 180 rupees
- For an English class | 960 rupees

Total rupees | 99,395

The number of schools and of scholars are thus distributed through part of the presidency, as to which the following details are given:

The number of villages in these districts is stated to be 15,782, while the number of village schools is only 1185, showing only one school for more than thirteen villages. The chief obstacle in the way of establishing new schools is stated to be the difficulty of obtaining qualified teachers: many of those at present employed are indeed far from possessing the qualification for the situation; but this is an obstacle which, if the government were so disposed, might be materially lessened, or indeed removed, in the course of a few years, by the establishment of normal schools in the chief town of each district.

A literary magazine has been established for many years in Bombay. Three quarter volumes of its transactions were printed between 1819 and 1823. In 1819 the society became a branch of the Royal Asiatic Society of London. There is also a Geographical Society recently established at Bombay.

Our information concerning the state of crime throughout the Bombay presidency, is very insufficient. Returns have been made from the greater part of the districts, stating
the number of persons who have been charged with the commission of offences during the five years ending with 1829. The returns made for the last year of this series are more complete than those for the earlier years, and enable us to offer the following abstract of the number of offenders, and the punishments awarded to those of them who were convicted on trial. Not any statement is given as to the nature of the crimes, nor as to the connexion between the crimes and the punishments awarded. The inconvenience of this deficiency has been felt by the home government, and we perceive that instructions have been given to supply the omissions in future returns.

Abstract of the Proceedings of the Criminal Courts and the Police under the Presidency of Bombay, in the year 1829.

| The expense of maintaining this force amounted to 1,949,519l., exclusive of the cost of military stores sent from Europe. The public revenue and charges of government in this presidency during three years, from 1831-32 to 1833-34, were as follows:—

| Revenue | £3,096,343 | £2,125,340 | £2,269,662 |
| Charges, including interest on debts | 2,754,925 | 2,662,741 | 2,606,068 |
| Deficiency | £638,552 | £557,401 | £267,354 |

The above charges are exclusive of any proportion of the expenditure incurred in England for the general management. The statement from which this abstract has been drawn does not afford the means of ascertaining the amounts to the different districts. Such a statement was given for the year 1827-28, for the undermentioned districts, showing the gross aggregate collections, and the charges in the revenue and judicial departments. It was as follows:—

(Rennell's Memoir of a Map of Hindustan; Mill's History of British India; Tables of the Revenue, Population, etc., of the United Provinces; Reports of the Legislative Council of India, parts iii. and iv.; McPherson's History of the European Commerce with India; Niebuhr's Description of Bombay, vol. ii., Copenhagen ed.; Vincent's Periplius of the Erythraean Sea, part ii.; Reports of Committees of both Houses of Parliament concerning the Affairs of the East India Company in 1831 and 1832.)

BOMBAY. This word is derived from the Greek bombyx (βομβύξ), denoting both a silk-worm and the silk spun by that insect.

In ancient times, the name of a fabric woven of worsted and silk; the warp being the silk, the weft (also called shot) the worsted. The worsted is thrown on the right side, which has a twist upon it. The manufacture of bombazine originated in Norwich, and is now almost entirely confined to that city, Salem, and Halifax in Yorkshire.

The weaving of worsted stuffs was originally introduced into England by the town of Norwich in the reign of Henry I. by a Dutch colony, who, being driven from Holland by an inundation, settled at Wursted or Worsted (hence the name), in Norfolk. The first charter granted to the city of Norwich by Henry I. enabled the Flemings, who had long frequented the city for the purchase of wool, to settle there and vest their property with greater security in the manufacture of worsted stuffs. Norwich became in consequence one of the most flourishing cities of England, and, being long durée, the government thought fit to protect the worsted weaving and wool trade by many statutes, writs, and proclamations, and by granting great privileges to foreign artificers settling in the city.

In 1574 an act was passed for the true making of worsteds in Norwich and Norfolk, authorizing the weavers yearly to elect eight wardens, with the power to survey all worsteds, and make such regulations as were judged to be for the good of the craft. In 1575 the Dutch elders presented in court a book containing the work of cotton and worsted cloth, with the drawings of the manner and order of making the same, together with the sort and name of all the worsted cloths, the manner of weaving them, and the names of such worsted cloths as were usually used in Holland.

BOMBElli RAPHAEL, a Bolognese mathematician of the sixteenth century. We know nothing of his birth, life, or death, except his work on Algebra, published in 1572 (Hutton), or in 1579 (Montuella, Bousat, Wallis, Delambre, Deshollin, Desargues, Desargues, etc.), or in both (Laocoon, Bip. U. etc.). The book itself is divided into two parts. Bombelii is principally known as the first who attempted the solution of the cubic equations. He gave the geometrical solution which depends upon the construction of a circle, and observed that the latter problem may be reduced to the solution of a cubic equation. He is also the first who attempted the actual extraction of the cube root in the result of Cardan's (or Tartaglia's) well-known formula.

Bombelli states that he discovered a manuscript of Diophantus in the Vatican Library, and that an author who had translated the greater part for publication. He says, that he found frequent references to Indian authors, from which he learned that algebra was known to the Hindoos earlier than to the Arabs. This assumption has been much quoted as a proof of the priority of the Hindus, and numerous manuscripts now existing (three in number) to be closely examined, but without finding any thing to confirm Bombelli's assertion; which remains a puzzle, since there is no suspicion of deceit, and the work of Diophantus is in reality far older than any of those attributed to the Indian Yuga Ganita. But as Bombelli is said, in the Toulouse edition of Diophantus, to have misinterpreted the questions from that writer which he inserted in his own algebra, it is possible that he may have not well understood the Greek. (ALONSO, Hist. Mat. vol. ii. p. 259; Montuella, Hist. des Math. vol. i. p. 598; also Cossali, Storia di Algebra. If there be any mention of Bombelli in Khastner's History or Murhard's Bibliography, we cannot find it.)

BOMBIE, the generic name of those insects commonly called humble-bees; this latter name was derived (Messrs. Kirby and Spence conjecture) from the German hummel or hummel-hiene, a name probably given to these insects from the humming sound which they emit.

The Bombi belong to the order Hymenoptera, family Apidae, and, as regards the English species, are by far the largest of the tribe. They may be distinguished by the following characters:—body thickly covered with hairs, having a longitudinal groove and an indentation extending across from the middle of the side; proboscis of the male covered with a patch of dark brown or black on the upper side; posterior tibia compressed, smooth, margined with strong recurved hairs, and armed with spines at the apex. *

* These reciprocal hairs (corbicula) form, as it were, a little basket, in which the Bombi carry to their nests the flowers which they collect from flowers.
The above are the peculiarities of the females. In the males the antennæ are thirteen-jointed and considerably longer than those of other bees; the hinder tibia want the corbicular; the mandibles are bidentate at the apex and each furnished with a tuft of curved hairs; they differ likewise in possessing no sting and in the structure of their claws, but these two last characters are common to the whole tribe of Apidae.

The neater bees resemble the females in every respect excepting size; in this they are inferior to the males, which latter are rather less than the females.

Kirby, in his monograph on the bees of this country, enumerates thirty-seven species as belonging to his section * * * c. 2; this section, with the exception of a few species [*Pavirius*], now constitutes the genus of which this article treats.

The prevailing colours of the species are yellow, red, and black; these colours are disposed with a certain degree of uniformity, we have arranged the following, which form the principal part of the British species, under three heads, viz., those which have the apex of the body more or less red, those which have that part white, and those in which the ground-colour of the body is yellow or buff; by this arrangement much repetition in the descriptions is avoided.

**Section 1.—Apex of the body red.*

*B. lapidarius* (female), black: the male is rather long and narrow; head and anterior and posterior portions of the thorax yellow.

This species, well known by the name red-tailed bee, is one of the largest and commonest of the genus; the females are to be seen in the spring and summer months; in the autumn, when the males make their appearance, they are less common.

*B. Raitellus* (female), smaller and shorter in proportion than the last, from which it may moreover be distinguishedly having red hair on the hinder tibia.

*B. Derhamellus* , colour-sable-brown; thorax and abdomen each with a black fascia; most probably the male of the last described.

*B. subinterruptus* (female), black: anterior portion of the thorax yellow; abdomen with a subinterrupted fascia of the same colour towards the base.

*B. pratorum* , black: anterior portion of the thorax yellow.

*B. Burrellanus* (male), yellow: thorax with the central portion black; abdomen with a black fascia near the middle.

*B. Cutilamens* (male), like the last, but the fascia of the abdomen is very narrow, occupying only one segment.

*B. Donovanellus* (female), black: thorax with the anterior portion yellow; abdomen with the basal portion yellow.

In the male the anterior portion of the thorax is obscurely coloured.

**Section 2.—Having the apex of the abdomen white.

*B. terrestris* . This is the largest and most common of the yellow and blackumble-bees; it has the anterior margin of the thorax and the segment next the basal one of the abdomen of a yellow or buff colour; the rest of the body is black, with the exception of the apex, which is sometimes of a dirty yellow colour and at others white.

The nearest of all the species are very variable in size, but in this there appears to be the greatest extreme; we have specimens which are scarcely as large as the common hive-bee.

*B. Hortorum* , black: thorax with the anterior and posterior parts yellow; abdomen with the base yellow; rather less than the preceding species.

*B. Tunsallanus* (female), black: thorax with the anterior and posterior margins narrowly edged with yellow.

The insect described by Kirby under the name of *Larissa* , a slanderer of bees (most of them are hairy; some produce irritant to the hand when touched), and assume the pupa state in a cocoon spun for its protection. The pupa is simple.

*B. floralis* , yellow: abdomen with a black spot on each side of the second segment, the three following segments with their bases black.

*B. Bechithelulius* , pale buff colour: thorax and apex of the abdomen reddish yellow, the latter with a black fascia in the middle.

*B. Curtisellus* , like the last, but the abdomen is black, with the base of reddish-yellow.

*B. Fosterelli* , thorax buff-coloured, with the anterior part blackish: abdomen with three obscure black fasciae.

Obs.—We have reason to believe the four last to be varieties of the same species.

*B. ylifrom* , yellowish white: thorax with a black fascia; abdomen with two black fasciae; the apex red interspersed with white.

*B. fragrans* , bright yellow; thorax with a black fascia.

Of the above species *B. terrestris* and *Lepidurus* are the largest; *B. fragrans* , *Tunsallanus* , and *Hortorum* are the next in size; all the rest of the species are nearly of a size, with the exception of *B. pratorum* , which see description.

For the habits of the species see *Humile-Bee* , and for more detailed descriptions we refer our readers to Kirby's *Monographia Apum Angliae* .

**BOMBCYCIDÆ** (entomology), a family of the order Lepidoptera, belonging to the section Lepidoptera-nocturna of Latreille.

The principal characteristics of this family are their possessing only rudimentary maxillae, remarkably small palpi, and bipectionate antennæ.

Some of the species fly very rapidly, and make their appearance in the day-time as well as in the evening. The caterpillars of some of the species are hairy (some produce irritation to the hand when touched), and assume the pupa state in a cocoon spun for its protection. The pupa is simple.

One of the most interesting of the family is the *Bombyx mori* , well known as the moth to which the silkworm turns. This species, which was originally from China, is of a white or cream-colour, with a brown fascia and two or more waved lines of a deeper colour crossing the upper wings. In this country the eggs of this moth hatch early in May; the caterpillar or silkworm is at first of a dark colour, but soon becomes light, and in its tints much resembles the perfect insect, a circumstance common in caterpillars. Its proper foo is the mulberry, though it will likewise eat the lettuce and some few other plants; on the latter however it does not thrive equally well, and the silk yielded is of a poor quality.

The silkworm is about eight weeks in arriving at maturity, during which period it changes its skin four or five times. When about to cast its skin it ceases to eat, raises the forepart of the body slightly, and remains in perfect repose. In this state it is necessary that it should continue for some
little time, in order that the new skin, which is at this time forming, may become sufficiently strong to enable the larva to burst through the old one. This operation, which is apparently one of considerable difficulty, is performed thus:—the fore-part of the old skin is burst; the silkworm then by continually writhing its body (but not moving from its spot) contrives to thrust the head and tail, and ultimately to disengage itself altogether: this last part of the operation however is the most difficult, since it is no uncommon occurrence for them to die from not being able to disengage the last segment of the body from the old skin.

Those who have reared silkworms must have observed how large the head is in proportion to the body in those which have just changed their-skins: this circumstance is worthy of observation, for in it will be found a most beautiful point for the classification of this insect. When the larva of an insect has just changed its skin, every part is soft, and in many cases (such as caterpillars) the greater portion of the body still remains in this flexible state; but the skin of the head and some few other parts, in all instances, soon become hardened, after which it never grows. The same happens with those larvae which have a skin of a great measure covered with hard plates, which circumstance leaves no parts to enlarge but such as are flexible. In the instance of a caterpillar the body increases in size rapidly after change; but the parts which will be observed, does not expand, and although the body may be stretched much it does not appear that the skin has grown; it seems only to be stretched with the increase of size of the inner parts. In the case of those larvae which have the body covered with hard plates, the skin stretches out on the plates that stretch to allow of growth in the interior parts, just before changing skin all the plates are considerably separated.

From the above we conclude that the external covering of insects does not grow at all, except, as at the time of reposing, to the extent of the soft skin, after which operation the head, and those parts which soon become hard, are sufficiently grown to last until the next change; and also that the soft parts of the external covering will bear stretching to that extent and no further, when the body is increased from one thread to another. With respect to the silkworm and other caterpillars, an unobservant person would not readily understand how the head, which is much larger than the one the case of which has just been cast off, can come to a close comparison. From the foregoing account it appears just before it is about to change its skin, it will be seen that such is not exactly the case, for part of the new head may be seen thrust out before the old one, so that the fore-part only is included by the latter.

When full grown the silkworms come to a convenient spot, and as it does not change the position of the hinder portion of its body much, but continues drawing its thread from various points and attaching it to others, it follows that after a time its body becomes in a great measure inelastic, as the silkworm is not in the habit of moving from its spot. With this, it is continued from one thread to another, the silkworm moving its head and spinning in a zigzag way, bending the fore part of the body back to spin in all directions within reach, and shifting the body only, to cover with silk the part which was beneath it. As the silkworm spins its web by thus changing its fore part of the body back, and moves the hinder part of the body in such a way only as to enable it to reach the farther back with the fore part, it follows that it incloses itself in a cocoon much shorter than its own body, for soon after the beginning the whole is continued with the body in a bent position. From the foregoing it appears that with the most simple instinctive principles all the ends necessary are gained. If the silkworm were gifted with a desire for shifting its position much at the beginning of the work it could never inclose itself in a cocoon; but by its inclosing itself, as above explained, it incloses itself in a cocoon which only consumes as much silk as is necessary to hold the chrysalis.

During the time of spinning the cocoon the silkworm decreases in length very considerably, and after it is complete it becomes quite torpid, soon changes its skin, and appears in the form of a chrysalis. The time required to complete the cocoon is about five days. In the chrysalis state the animal remains from a fortnight to three weeks; it then bursts its case and comes forth in the imago state, the moth having previously dissolved a portion of the cocoon by means of a thread which it spins out of the silkworm-moth. [Silk.]

BOMBYCILLA (zoology). The name of a genus of tooth-billed birds (Dentirostra). Cuvier places the genus B. under the family Dentirostres, and its order Passe- reaux. Latreille also arranges it under that family; but does not allow it to belong to the Dentirostres, and classes it among its first family, that of the broad-billed birds (Lattores). Temminck, considering it to be an omnivorous bird, places the genus in his order Bomy- byciformes, in his second order Omnisores; Vieillot's second order (Sylvian Birds, Sylviocole) contains two tribes; and in the sixteenth family (Baccivorti, or berry-eaters) of the second tribe (Amenacidylis), the genus in question will be found. Vigors places it in the second tribe Dentirostres of his second order; Innoresores or perch-eating birds; and, after some hesitation, and expressing his doubt whether its natural situation is not in the family Merulidae, is inclined to arrange it provisionally among the Pipitides, his last family (or third tribe) among the Rosoridae, which contains the genera Sarcitici. Swainson, in Fauna Boreali-Americana, arranges it under his Bomybyclinea, a sub-family belonging to the aberrant group of his Amphilidae, or fruit-eaters; but, in giving his table of Amphilidae, he expresses considerable doubt whether it belongs to that tribe or to that of the Linnaeus at one time made it a butcher-bird (Lanitis), and afterwards an Amphetis. Brisson classed it among the thrushes (Turdus), and Illiger among the crows (Corvus).

The birds of this genus are known by the English names of Wax-wings, Waxen-wings, and Silk-tails; in fact, Le Jaeger de Bokhémé (Buffon, &c.), Grand Jaeger (Temminck) and Geay de Bohémé of the French; Garrulo de Bomia of the Italians; Rüthigergraer Sei- denwanzen (Meyer), Europäischer Seidenwanzen and Der Gemeine (Bayer), that is, the common Linnæus, Garrulus Bohemieus of Gesner, Bombecylla, Schwenck, Aegilops, Aldrovand, Bombycilla Bohemia of Brisson; Ampelis garrulus of Linnæus; Bombyciphora garrula, Brum; Bombyciphora poliocellia of Meyer; Bombivora garrulus of Temminck, and Bombycilla garrula of Vieillot.

In addition to the nomenclature above given, the bird is said to be named by the Italians in some localities Becco- Prione, in others Gallieto del bosco; and by the bird-catchers of Bologna Uccello del mondo novo; by the Ger- mans Zänzer, and by the French Sceau-ercol and Schwan- Lesché, and by those in the neighbourboud of Nuremberg Beemerl and Bemmel; by the Swedes Siden-svan; by the Bohemians Brkoslav; and by the Poles Jedwabnicza and Jemilowka.

That the Bohemian Chatterer was known to the ancients there can be little doubt; but a great deal of obscurity prevails as to the names by which it was distinguished. Some have taken it to be the Incendiaria Asiae of Pliny (Book x, c. 13), the inauspicious bird, on account of whose appearance the Romans midsummer flame would rise above the smoke, especially in the consuls of L. Cassius and C. Marius, when the apparition of a great owl (Bubo) was added to the horrors of the year. Others have supposed that it was the bird of the Hercynian forest (Book x, c. 47), whose feathers shone in the night like fire. Aldrovandus, who collected the opinions on this point, has taken some pains to show
plentiful in the neighbourhood of Bury St. Edmunds, Suffolck, in the few days in January, 1835, in which snow lay upon the ground. On the 19th, four were seen in Rushbrook: on the 21st, a party of nine or ten was observed in the neighbourhood of Rougham; and on the same day one was seen near Milton, Norfolk. Of late, a flock of four or five, or either two or three were seen in Ickworth Park. About the same time one was shot at Norton, and four were seen in Newton, and one in the gardens of Hardwicke House. On the, I believe, 24th, five or six were seen feeding on the haws of hedges, in the neighbourhood of Ipswich. The shot at Norton had several haws in its stomach, as had another that was shot in the neighbourhood of Bungay. Two, at least, additional have been shot in or about Thetford. (Henry Turner, Curator of the Botanic Garden, Thetford, Norfolk.)

In Worcestershire, a male was shot at Radford, near Evesham, and a female at Claines, both during the past winter; and of the two, deemed 'a fine pair,' the preserved forms are in the museum of the Worcester Natural History Society. (Berrow's Worcester Journal, April 18, 1835.)

A very fine individual (a male it was presumed to be), which had its colours remarkably bright and vivid, and the four central of its tail-feathers terminated each in a hoary appendage, the colour of red sealing-wax, and identical in kind with that which each of certain feathers in the wings is terminated, was killed near Harnaby Bridge, in the neighbourhood of Carlisle, Cumberland, on December 8, 1831. This was a second individual with appendages to certain feathers of the tail, which had been taken in the neighbourhood of Carlisle, Cumberland. (Phil. Mag., Feb. 1832, p. 84.)

An individual was taken alive early this winter, 1834-35, with birdlime, near Netherwitton, Northumberland; and I saw it lately (April, 1833), very tame and healthy, in the possession of Mr. John Cockburn, who has recently retired from the Service. Some other individuals, its companions, were shot, at about the same time, which he has preserved. (W. C. Trevelyan, Wallington, Northumberland.)

In northern Russia, and the extreme north of Norway, according to Mr. J. F. Hegner, in his account of Helsingfors, they are seen in great numbers every winter, being observed there earlier than in temperate countries. In northern Asia and eastern Europe their migrations are tolerably regular. Very numerous flocks pass through Scania in November, and are again seen on their return in the spring. But the species is not confined to Europe and Asia. 'By a singular coincidence,' says the author last quoted, 'whilst we were proclaiming this species as American, it was received by Temminck from Japan, together with a new species, which he named the Japanese Hox, and which is closely allied to our own. He states, that his best specimen was shot on the 20th March, 1825, on the Ahabasca river, near the Rocky Mountains; and he observes that the species appears to spread widely, as he had been credibly informed by hunters, that 'eider-birds of a large kind' were shot along the coast of Japan. He adds, that he is at a loss to conceive why it should never have been observed on this side of the last-mentioned river. Mr. Drummond, in the spring of 1826, saw it near the sources of the Athabasca; and Dr. Richardson observed it in the same season at Great Bear Lake, in lat. 62°, where a male, of which he gives a description, was shot on the 24th May of that year. 'Specimens,' writes Dr. Richardson, 'procured at the former place, and transmitted to England by Mr. Hudson, were afterwards accepted by Mr. Leach, who introduced the species into his great work on the birds of the United States. In its autumn migration southwards, this bird must cross the territory of the United States, indeed, without shelter of any kind within it; but I have not heard of its having been hitherto seen on the coast to the south of the fifty-fifth parallel of latitude.'

The mountainous nature of the country skirting the Northern Pacific Ocean being congenial to the habits of this species, it is more generally diffused in New Caledonia and the Russian islands, and is said to extend to the eastward of the Rocky Mountain chain. It appears in flocks at Great Bear Lake about the 24th of May, when the spring thaw has exposed the berries of the Alpine arbutus, and the Indian vacrunum, &c., that have been frozen and covered during winter. It is, however, seen only and none of the Indians of that quarter with whom I conversed had

** Loudon's Magazine** for Sept. 1835, p. 511.
seen its nests; but I have reason to believe that it retires in the breeding season to the rugged and secluded mountain limestone districts, in the sixty-seventh and sixty-eighth parallels, when it feeds on the fruit of the common juniper, which abounds in these places. Dr. Richardson adds, that he observed a large flock of at least three or four hundred of these birds on the slopes of Goat Rock, near Point House, early in May, 1837. They alighted in a grove of poplars, settling on one or two trees, and making a loud twittering noise. They stayed only about an hour in the morning, and were too shy to allow him to approach within gunshot.

We have hitherto only spoken of these birds in a migratory state, and the question presents itself, where do they breed? To this no one has yet been able to give a satisfactory answer. Bonaparte thinks it probable that their chief nest place is on the plains of the old continent, and hazards an opinion that the extensive and elevated table-land of Central Asia is their principal rendezvous, whence, like the Tartars in former times, they make their irregular excursions. Temminck is obliged to say, "Propagation inconnu," adding an "on dit," that it makes its nest far up in the north, preferring mountainous countries, and building in the crevices of rocks. Bonaparte expresses his disbelief of this, judging from analogy. Beechstein says that it does not build in Germany when wild, but with the Ararat.

Bonaparte gives a very amiable character of these birds in a state of nature, attributing to them a particular sentiment of benevolence, even independent of reciprocal sexual attraction. "Not only," says the Prince, "do the male and female feast together on the nest; but the most unkind, and even the most parasitical, mutual kindness have been observed between individuals of the same sex." Speaking of their habits he says, "They always alight on trees, hopping awkwardly on the ground. Their flight is very rapid; when taking wing, they utter a note resembling the syllables, ar, ra, but are generally silent, notwithstanding the name that has been given them. Beechstein says, "when wild we see it in the spring eating, like thrushes, all sorts of flies and other insects; in autumn and winter, different kinds of berries; and in time of need, the branches of trees and laurel leaves and laurel berries. trees." Willughby states that it feeds upon fruit, especially grapes, of which it is very greedy. "Wherefore it seems to me," he adds, "not without reason, to be called by that name (ampelis)." Bonaparte makes their food to consist of different kinds of juicy berries, or of insects, observing that they are fond of the berries of the mountain-sax and phytolacca, and that they are extremely greedy of grapes, and also, though in less degree, of juniper and laurel berries, apples, currants, figs, and other fruits. He adds that they drink often, dipping their bills repeatedly.

In captivity its qualities do not appear to be very attractive, according to Beechstein, who says that nothing but its beauty and scarcity can render the possession of it desirable, for that it is a stupid and lazy bird. Indeed, he draws such a picture of its greediness and dirty habits that, if it be not overcharged, few, we should think, would wish to have it as an inmate. Leaving out the more unpleasant parts of his description, we take the following extract from his cage-birds or stove-birds—"During the ten or twelve years that it can exist in confinement, and on very meagre food, it does nothing but eat and repose for digestion. If hunger induces it to move, its step is awkward, and its jumps so clumsy as to be disagreeable to the eye. Its song consists only of weak and uncertain whistling, and little resembling the thrush, but not so loud. While singing, it moves the crest, but hardly moves the throat. If this warbling is somewhat unmusical, it has the merit of continuing throughout every season of the year. When angry, which happens sometimes near the confined feeding-droog, it knocks very violently with its beak. It is easily tamed. The same author says, that in confinement the two universal pastes appear delicacies to it; and it is even satisfied with bran steeped in water. It swallows everything voraciously, eatable, such as potatoes, cabbage, salad, fruit of all sorts, and especially white bread. It likes to bathe, or rather to sprinkle itself with water, for it does not wet itself so much as other birds. It is taken in nooses, to which berries are fixed, which, for this purpose, says the author last quoted, "would almost be kept in store till February. It appears to be frightened at nothing, for it flies into nets and traps, though it sees its companions caught and hanging, and uttering cries of distress and fear."

Description. Length about eight inches; the size altogether approaching that of a starling.

Male. Bill strong, black, except at the base, where the colour inclines to a yellowish white; nostrils hidden under small black feathers. Iris purplish red. Chin and throat velvety black, as is also the streak (in the midst of which is the eye) passing from the bill to the hinder part of the head. Forehead reddish-brown. Head feathers long, silky, forming a reclining crest approaching to reddish-chestnut, which the bird can erect or degrees at pleasure. Upper parts purplish-red, or vinaceous-brown dashed with ash-colour, the rump lightest. Breast and belly pale purplish, tinged with pale brownish-red. Vent and under tail-coverts orange-brown, inclining to reddish-orange. Greater wing-coverts black, tipped with white. Lesser wing-coverts of a shade darker than the general tint of the upper plumage. Primaries black, with a bright-yellow spot near the white tips of their outer webs. Montagu says that the three first are tipped with white, and the others with yellow on their outer margins. Secondaries grey, tipped with white on the outer web, and seven or eight of them terminated with small flattish oval horned appendages, of the colour of red sealing-wax. Sometimes there are not more than five or six of these wax-like tips, and in Montagu's specimen there were five on one side and six in the other. Graves gives the number at from six to nine (Beechstein at from five to nine),* and mentions the specimen in Mr. Hope's collection, which had some on the tail, which is black tipped with yellow, and dashed with ash-colour on the base. Shank, toes, and claws, black.

Female. Generally similar to the male; but the yellow on the wings and tail is not so bright, nor are the wax-like appendages so large or so numerous.

Some have said that the female wants both the yellow and the wax-like ornaments. Graves says that the female has white on the wing where the male has yellow, and that she is wholly destitute of the wax appendages. Some females may have been taken with the plumage last-men tioned; but in general, the first description will be found the most correct. Beechstein says that the Aras basca river was a female. It was, according to him, eight and a half inches in length, and fifteen in extent. The bill was three-quarters of an inch long, black, but paler in the middle. The female has the habit of the under side. There was white on the tail, whatever on the wing. The tail was tipped with pale-yellow for half an inch, and four only of the secondaries were furnished with the bright-red appendages. Beechstein says that the narrow wax tips at the end of the tail denote that the bird is a very old male. The flesh of this species is said to be delicate food.

[Bombycilla Bohemica, male.]

* In a fine specimen shot in January, 1813, by Mr. John Creighton, of H. H. Garth, in Thornthwaite, close to his own house, the secondaries were...
such excess, as sometimes to be unable to fly, and suffer themselves to be taken by the hand. Indeed I have seen some which, although wounded and confined in a cage, have eaten of apples until suffocation deprived them of life, in the course of a few days. When opened afterwards, they were found to be gorged to the mouth.

Notwithstanding this gregariousness, they are, according to some writers, remarkable for their social and kindly disposition in a state of nature. Nuttall, on the authority of an eye-witness, states that one among a row of birds seated upon a branch, darted after an insect, and offered it to his associate when caught, who very delicately passed it to the next, and each delicately declining the offer, the morsel went backwards and forwards before it was appropriated.

After fattening on the fruits of May and early June they begin to attract their attention to the continuation of the species, and commence, about the tenth or twelfth of the latter month, building a nest large in proportion to the bird, sometimes in their favourite cedar-tree (Juniperus Virginiana, Wild.), but more frequently in the orchards, generally choosing a forked or horizontal branch of an apple-tree some ten or twelve feet from the ground. Outwardly and at bottom is laid a mass of coarse dry stalks of grass; the inside is lined entirely with very fine stalks of the same material. The eggs are three or four, of a dingy white, thick at the broad end, and becoming very narrow at the other, marked with small roundish spots of black of various sizes and shades; and the great end is of a pale dull purple tinge, marked likewise with touches of various shades of purple and black. About a week last spring I saw one of the young birds first fed on insects and their larva; but as they advance in growth, on berries of various kinds. The female," says Wilson, from whose personal observation the foregoing facts are given, "if disturbed, darts from the nest in silence to a neighbour tree or bushes; no cries are ever heard from either parent, nor are they even seen, notwithstanding you are in the tree examining the nest and young. . . . The season of love, which makes almost every other small bird musical, has no such effect on them: for they continue at that interesting period as silent as before." Nuttall, who observes that they are so sociable even in the breeding season that several nests may be observed in the same vicinity, gives the following interesting account of their nidification:—Two nests in the Botanic Garden at Cambridge were found in small hackberry trees at the distance of sixteen or eighteen feet from the ground, in the forks of the main branches. One of these was composed of dry coarse grass, interwoven roughly with a considerable quantity of dead hemlock sprigs, further connected by a small quantity of leaf-weed and the ragged ends of thin grape-vine bark, and dry leaves of the silver fir. In the second nest the lining was merely fine root fibres. On the 4th of June this nest contained two eggs: the whole number is generally about four or five; these are of a pale yellowish-white, of a remarkable form, the egg end rounded, the other end flattened, of a pale clay white, inclining to olive, with a few well-defined black or deep umbrer spots at the great end, and with others seen, as it were, beneath the surface of the shell. Two or three other nests were made in the apple-trees of the Cambridge orchard. As the time of the nesting season approached, the other on a depending branch easily reached by the hand. These were securely fixed horizontally among the ascending twigs, and were formed externally of a mass of dry wiry weeds: the materials being firmly held together by a large and well-entwined covering of corded moss. These last nests, which are placed on the ground, and must have at least two hatches in a season; for as late as the 7th of September a brood in this vicinity were yet in the nest. The period of sitting is about fifteen or sixteen days.'
Having endeavoured to give the reader some idea of the habits of the cedar-bird in a state of nature, we proceed to lay before him Nuttall's account of its manners in captivity:

' A young bird, from one of the nests described in the hemlock, was thrown upon my protection, having been by some means ejected from its cradle. In this critical situation however he had been well fed or rather gorged with berries, and was merely scratched by the fall he had received. Fed on cherries and mulberries he was soon well fledge, while his mate in the nest was suffered to perish by the forgetfulness of his natural protectors. Coeval with the growth of his wing-featheres, were already seen the remarkable red waxen appendages, showing that their appearance indicates no particular age or sex; many birds, in fact, being without these ornaments during their whole lives. I soon found my interesting protégé impatient on the cage, and extremely voracious gorging himself to the very mouth with the soft fruits on which he was often fed.

The throat, in fact, like a crab, admits of distention, and the contents are only gradually passed off into the stomach. I now suffered the bird to fly at large, and for several days he descended from the trees in which he perched to my arm for food; but the moment he was satisfied he avoided the cage, and appeared by his restlessness unable to survive the loss of liberty. He now came unheed me, and finally joined the laping manner of tze, tze, tze, and was enticed away, after two or three attempts, by his more attractive and suitable associates. When young, nature provided him with a loud impatient voice, and it-did, it-did, it-it-itit (often also the clamorous cry of the young Baltimore) was his desiring and almost incessant call for food.

Another young bird of the first brood, probably neglected, cried so loud and plaintively to a male Baltimore bred in the same tree, that he commenced feeding it. Mr. Winship of Brighton informs me that one of the young cedar-birds who frequented the front of his house in quest of honey-suckle berries, at length, on receiving food, probably also abandoned by his roving parents, threw himself wholly on his protection. At large, day and night, he still regularly attended the dessert of the dinner-table for his portion of food, and remained steadfast in his attachment to Mr. Winship till killed by an accident, being unfortunately trodden under foot.'

[Bombylella Carolinensis, male.]

The following is Wilson's description:—Length seven inches, extent eleven inches; head, neck, breast, upper part of the back and wing-coverts, a dark fawn colour; darkest on the back, and brightest on the front; head ornamented with a high pointed, almost upright crest; line from the nostril over to the hind head velvety black, bordered above with a fine line of white, and another line of white passes from the lower mandible; chin black, graying externally bright; face and neck fawn, the face lying extremely close; bill black, mandible nearly triangular at the base, with bristles, short, rounded at the point, where it is deeply notched; the lower scolloped at the tip, and turning up; tongue as in the rest of the genus, broad, thin, cartilaginous and lacetated at the end; belly yellow; vent white; wings deep-slate, except the two secondaries next the body, whose exterior vane are of a fawn colour, and interior ones white, forming two whitish strips there, which are very conspicuous; rump and tail-coverts pale light brown, the tail the outer feathers into black, and tipped for half an inch with rich yellow. Six or seven, and sometimes the whole nine, secondary feathers of the wings are ornamented at the tips with small red oblong appendages, resembling red sealing-wax; these appear to be a prolongation of the shafts, and to be intended for preserving the ends, and consequently the vanes of the quills from being broken and worn away by the almost continual fluttering of the bird among the thick branches of the cedar.

The feathers of those birds which are without these appendages are more rounded and obtuse, and the feathers there smooth and perfect in those on whom the marks are full and numerous. These singular marks have been considered as belonging to the male alone, from the circumstance perhaps of finding female birds without them. They are however common to both sexes, and male and female birds are now lying before me, each with large and numerous clusters of eggs, and having the waxen appendages in full perfection. The young birds do not receive them until the second fall, when, in moulting time, they may be seen fully developed, as the feathers develop, the tail-feathers once or twice found a solitary one on the extremity of one of the tail-feathers. The eye is of a dark blood colour; the legs and claws black; the inside of the mouth orange; gap wide; and the gullet capable of such distention as often to contain twelve pounds of cedar-bird's flesh in a kind of cramp to prepare them for digestion. The chief difference in the plumage of the male and female consists in the dullness of the tints of the latter, the inferior appearance of the crest, and the narrowness of the yellow bar at the tip of the tail.

Audubon gives the following dimensions:—Length six inches and three-fourths, extent of wings eleven, bill along the ridge five-thousandths, along the gap three-fourths, tarsus three-fourths. The length of the male described by Dr. Richardson was seven inches six lines. The Doctor observes that a female procured by Mr. Drummond wanted entirely the waxen appendages to the secondaries, and says that a young bird in Mr. Swainson's collection has the upper plumage of the head and body of a hair-brown colour, lighter than the neck, and in Mr. W. Edwards' by nature bird, except that the former want the waxen appendages. The black frontal mark is narrower, and there is no black on the chin. The under plumage is mostly hair-brown, edged with yellowish-grey, the belly and vent being straw-yellow.

**Ahiatic Wax-wing**

The discovery of the Red-winged Chatterer, or Japanese Wax-wing, is one of the fruits of Dr. de Siebold's scientific mission to Japan by the government of the Netherlands. In size it bears a greater resemblance to the Cedar-bird than to the Bohemian Wax-wing, but differs from both in the nakedness of the nostrils (which are not hidden by the small feathers of the front, like the nostrils of the other two species of this small but natural group), in the length of the crest, and the beautiful black plumes with which it is ornamented, and by the entire absence of the wax-like appendages that tip the secondaries of its congers.

The length of the Japanese Wax-wing is six inches and six lines. The base of the bill is bordered by a black hand, which passes to the back of the head, surrounding the eye in its way, and terminates in the lower crest-feathers, which are of the same colour throughout; the chin and throat are black; the crest is long, composed above of feathers of an ahy-reddish colour with an inferior layer of the black...
plumes already alluded to; the breast, upper parts, and
wing-coverts are of a brownish-ash, and a red band tra-
verses the wing about the middle of it; all the quills are
of an ashy-black, the greater quills terminated with black
and tipped with white; the tail is of an ashy-black, tipped
with vivid red; the middle of the belly is of a whitish-
yellow; and the lower tail-coverts chestnut; shanks and
feet black.

The species is found in the neighbourhood of Nangasaki.
Temminck, to whom we are indebted for our knowledge
of the bird, which is described and figured in his Planches
Colorées, says that there is a specimen in the galleries of
the Museum of the Pays-Bas, and another in the collection
of M. Blomhof, the resident at Japan; and he observes that
the absence of the nostril-plumes furnishes a proof, also af-
forded in the genera Corvus and Garrulus, in contradiction
to the opinion of those systematists who would separate the
omnivorous birds with covered nostrils from those which
have those organs smooth or naked, and divide them into
distinct groups. He also considers the proper position of
the genus to be near the Hirundo (Kitts), and the Roiles
(Colaris of Cuvier, Eurystomus of Vieillot).

[Bombylia phainopetra, male.]

BOMBYLIDÆ (entomology), a family of insects of the
order Diptera, distinguished chiefly by having a long pro-
bos: The body is short and very hairy. Antennæ mo-
derate, four-jointed, the basal joint long, second very short,
third longest, the apical joint minute and tapering to a fine
point. The legs are long and very slender. Wings hori-
zontal.

The species of this tribe are all remarkable for their great
swiftness of flight: two species of the genus Bombylia are
not uncommon in open parts of woods, frequenting sunny
banks, where they may be seen, in the month of April,
hovering over flowers from which they sip the sweets by
means of their long probosces, which enables them to do
this without setting on the flowers.

At one time they will be seen apparently quite motion-
less in the air—for their wings vibrate so rapidly that they
cannot be discerned—a moment after they will make their
appearance at a few yards distance, having darted from one
spot to the other with such rapidity that the eye cannot
follow them. In their flight they emit a humming sound.

The two species here spoken of are B. major and media;
they are about one-third of an inch long and of a brown
colour: the former has the anterior part of its wings clotted
with an opaque brown colour, and the posterior part trans-
parent—latter has the wings adorned with numerous
brown spots, and their anterior portion but slightly clouded.

Mr. Stephens enumerates seven species of this genus
as indigenous to this country: they are sometimes called
humble-bee flies.

BONA, a corruption of the antient name Hippo-
na, called by the Arabs Beled el Anab, or, country of the
jujubes, is a seaport town of the regency of Algiers, in the
beyluk or province of Constantina, in 37° N. lat. and 8° 15'
E. long., and about 265 miles E. of Algiers. It lies on
the west side of a bay in which there is good anchorage.
The harbour of Bona is now choked up with mud, but there
are good landing-places in the vicinity of the town. The
Seiboos, a considerable river, enters the sea about two
miles to the S.E. of Bona. Between the town and the river is a
marsh, which is crossed by two small rivers, Wadi el Dasha
and Wadi el Boqimah, which flow into the Seiboos just
above its entrance into the sea. This marsh is believed to
have been the antient harbour of Hippo Regius, the scanty
remains of which town are seen about a mile and a half
south of Bona. Between the walls of Bona and the mara
are gardens planted with jujube-trees, and to the west and
south-west is a plain which extends far into the interior
in the direction of Constantina. Bona is built at the foot
of a hill which rises to the north and north-west of the
town, and which forms the extremity of a ridge which
runs westwards to the sea, as far as the gulf of
Stora. On the summit of the hill and about 500 yards
above the town is the Casabah, or citadel, which is strong
by its situation. The town itself is surrounded by a wall
with towers. An aqueduct which brought water into the
town has been cut off by the Arabs since the French occu-
pation of the place. Previous to that event Bona con-
tained between three and four thousand inhabitants, and
carried on a considerable trade by sea; it exported cattle,
corn, wool, hides, wax, and other produce. It was oc-
ocupied by the French in 1839, but soon after was evacu-
ated, when many of the inhabitants emigrated. It was
again occupied in 1831, but after a few months a revolt
among the inhabitants and the Turkish garrison in the
Casabah forced the French to evacuate the place a second
time. In 1834 the Arabs and Kabylies, on the arrival of a
French force by sea, set fire to the town and left it. The
French again took possession of the place, but the country
around continues hostile to them. Through all these vicissi-
tudes the population of Bona has dwindled away to a few
hundred inhabitants besides the French garrison. (Shaw;
Pichon, Alger sous la Domination Francaise; Berthezene,
Dix-Aout Mois à Alger.) Along the coast eastward of Bona
were the French settlements of La Calle and Bastion de
France, which France retained by antient treaties with the
regency of Algiers and for the protection of the coral
fishery, which is carried on along this coast chiefly by
French and Italian boats. These settlements however
were destroyed by the late Dey Hussein in 1827 in conse-
quence of the breaking out of hostilities. In the Excur-
sions in the Mediterraneen, by Major Sir Greville Temple,
between 1835, there is an account of Bona in 1839, and of the
ruins of Hippo Regius, which he visited.

BONACCI, LEONARDO. [LEONARD OF PISA.]

BONAPARTE, NAPOLÉON, born at Ajaccio
in the island of Corsica, the 15th of August, 1769. He was
the second son (his brother Joseph being the eldest) of
Carlo Bonaparte and of Letizia Ramollini, both natives of
Corsica. The house in which he was born forms one side
of a court leading out of the Rue Charles. [AJACCIO,]
In his birth registry, which is widely dispersed, his name is
written Bonaparte, but his father generally signed himself
Bonaparte, a mode of spelling which seems more accor-
dant with Italian orthoepy, although there are other
Italian names in which the first component part is written
and pronounced bona, as, for instance, Bonaventura, Corso,
&c., besides common nouns, similarly compounded,
such as bonzantia, bonaccia, &c. This appears in itself a question of little moment, but it has been made the subject of much controversy, which a sort of national importance has given to it if there had been done for the purpose of Frenchifying the name. (Louis Bonaparte's Réponse à Sir Walter Scott.) Bonaparte being a family name, the correctness of the spelling must depend upon custom, and we find that Napoleon after he became Emperor changed the spelling of his family name without the u, probably, as Bourrienne observes, because it was a shorter way of signing, and probably also because it was better adapted to French pronunciation; it corresponded likewise to the common way of speaking of most Italians, who, with the exception of the Tuscanians, pronounced the familiar conversation bomo instead of buno. Napoleon's name first became known to the world as Bonaparte, as such it is registered in his proclamations, dispatches, and other documents, and as such therefore it ought to be written in whom the Genoese have likewise adopted the same way of writing it.

Napoleon's father's family was originally from Tuscany, but had been settled in Corsica for several generations. There is a comedy written by one of his ancestors, Niccolò Bonaparte of San Miniato, citizen of Florence, styled La Vedova, Florence, 1568 and 1592. There is likewise a narrative of the pillage of Rome under Charles V., written by a Jacopo Bonaparte, Ragguagli Storico del Sacco di Roma dell' anno 1527, Cologne, 1736. Charles, Napoleon's father, was a relation of the Bonaparte family, and one of them was canon of San Miniato in Napoleon's time. Before the birth of Napoleon, his father had served under Paul in the defence of his country against the French, from whom the Genoese had bauxly sold the island. The entry of submission of Corsica to France took place in June, 1769, about a month before Napoleon's birth, who therefore, legally speaking, was born a subject of France. In the following September, Count Marburig, the French commissioner, convoked by the king's letters patent the States of Corsica, consisting of three orders, nobility, clergy, and commons, the family of Bonaparte, having shown their titles, was registered among the nobility; and Charles, some years after, repaired to Paris as member of a deputation of his order. This was a delightful visit, which was received with great respect by the judicial court of Ajaccio. He was then in straitened circumstances, as he had spent most of his little property in a bad speculation of some salt-pan, after having previously lost a lawsuit against the Jesuits about an inheritance. The friendship of Joseph Anton, the manufacturer, obtained him the admission of his son Napoleon to the military school of Brienne as a king's pensioner. Napoleon left Corsica for Brienne, when he was in his tenth year, in April, 1779. At Brienne, where he passed five years, Napoleon was placed in the French mathematics, but showed less disposition for literature and the study of languages. Pichegru was for a time his monitor in the class of mathematics. The annual report made to the king by M. de Keralio, inspector general of the military schools of France, in 1784, has the following remarks on young Napoleon:—Distinguished in mathematical studies, tolerably versed in history and geography, much behind in his Latin and in belles lettres, and other accomplishments; of regular habits, studious and well-behaved, he shows able bent and capacity for the future (remembr.) Much has been said of young Napoleon's taciturnity and moroseness while at school. Bourrienne, who was his schoolfellow, states the facts very simply. Napoleon was a stranger, for the French considered the Corsicans as such; he spoke his own dialect, until he learnt French at the school; he had no connections in France, he was comparatively poor, and yet proud-minded, as Corsicans generally are; the other boys, more fortunate or more lively in their disposition, teased him and taunted him, and therefore he kept to himself, was not talkative, and was uncritical of social and friendly feelings towards those who showed him sympathy, his intimacy with Bourrienne sufficiently proves. Many stories have also been told of his assuming an authority over his comrades, showing a precocious ambition, and greatness of mind; but these are contradicted by Bourrienne, with the exception that in one instance when the snow had fallen very thick on the ground, and the boys were at a loss what to do to amuse themselves, he proposed to make entrenchments with the snow, and to perform a sham attack, of which he was the leader.

There was nothing extraordinary in young Napoleon's school life; he was a clever, steady, studious lad, and nothing more. The school of Brienne was under the direction of the monks of the order of St. Francis de Paula, called Minimi, and Bourrienne speaks rather indifferently of their learning and system of education, though the teacher of mathematics and modern languages was considered as particularly well qualified. Bourrienne also states that Napoleon had made more proficiency in history than the report above mentioned gives him credit for: his favourite authors were Cæsar, Plutarch, and Arrian; the last two he probably read in Latin, or perhaps in Italian translations, for he does not appear to have studied Greek.

Napoleon left Brienne in October, 1784; some say in 1783; but Bourrienne is positive as to the date the 17th Oct., 1784, after Napoleon had been five years and six months at Brienne, and he accompanied him part of the way to Paris, with four of his companions, to proceed to the military school there, to continue his course of studies, until he had attained the age required for entering the army. The Paris school, and the students' manner of living, were on an expensive footing, which shocked young Napoleon, who wrote to Father Berton, his superior at Brienne, a long letter, in which he forcibly expressed the error of such a system of education, as luxury and comforts were a bad preparation for the hardships and privations attendant on the military career. He signed this letter with the following remarkable letter. In the regulations which he afterwards drew up for his military school at Fontainebleau, Napoleon followed the principles he had thus early manifested. Napoleon's spirit of observation, his active and inquisitive mind, and his quick perception of everything that attracted his attention, excited the attention of the superiors of the Paris school, who hastened the epoch of his examination, as if anxious to get rid of a troublesome guest. He was likewise remarked for the wild energy and strange amplifications in his style of expressing himself when excited, a peculiarity which had distinguished many of his subsequent speeches and proclamations. In September, 1785, he left the school, and received his commission as sub-lieutenant in the regiment of artillery de la Fère, and was soon after promoted to a first rank. Napoleon, among other advantages, was enabled to travel to Valence. His father had just died at Montpellier of a scuritus in the stomach. An old great uncle, the Archdeacon Lucien of Ajaccio, now acted as father to the family; he was rich, and Charles had left his children poor. Napoleon's elder sister, Caroline, had married the Duke of Modena, who resided at Modena, and his brother Joseph, who was a captain in an inn at Autun in Burgundy, returned to Corsica, where his mother, sisters, and younger brothers resided, as well as a half-brother of his mother, of the name of Fesch, whose father had been an officer in a Swiss regiment in the Genoese service, formerly under the orders of Malaspina. This regiment, when the Swiss regiment, was allowed 1200 francs yearly from his family, probably from the archdeacon, which, added to his pay, enabled him to live comfortably and to go into company. He appears to have entered cheerfully into the sports and amusements of his brother officers, while at the same time he did not neglect improving himself in the studies connected with his profession. While at Valence he wrote a dissertation in answer to Raynal's question. 'What are the principles and institutions by which mankind can obtain the greatest happiness?' and this dissertation was sent anonymously to the Academy of Lyons, which adjudged to him the prize attached to the best essay on the subject. Many years after, when at the height of his power, he happened to mention the circumstance, and Talleyrand having sought the forgotten MS. among the archives of the Academy, presented it to him one morning. Napoleon, after reading a few pages of it, threw it into the fire, and no copy having been taken of it, we do not know what his early ideas might have been about the happiness of mankind. (Les Cases Napoleon; Vol. i. p. 152.) In October, 1785, Napoleon was at Fontainebleau, and was instructed by Talleyrand; but in October, 1786, interesting himself in the proceedings of the first National Assembly. The officers of his regiment, like those of the army in general, were divided into royalists and democrats;
several of the former emigrated to join the Prince of Condé. Napoleon however refused to follow the same course: he took the popular side of his cause, and engaged in the sedition of his brother officers in the regiment. In 1792 Napoleon became a captain in the regiment of Grenoble artillery (Las Cases, vol. i.), his promotion being favored probably by the emigration of so many officers. By order of Gen. E. he was sent to Egypt in July 1793, after his return from Corsica. He however was at Paris in 1792, and there met his old friend Bou- rienne, with whom he renewed his intimacy. He appears to have then been unemployed, probably unattached, while the army was undergoing a new organization. Napoleon and Bourienne happened to be at the Café des Deux Magots on the 26th of June, 1792, at a coffee-house in the street St. Honoré, when the mob from the faubourgs (a motley crowd armed with pikes, sticks, axes, &c.) were proceeding to the Tuileries. Let us follow this camarade, whispered Napoleon to his friend. They went accordingly, and saw the mob break into the palace without any opposition, and the king afterwards appear at one of the windows with the red cap on his head. It is all over henceforth with that man, exclaimed Napol- eon; and returning with his friend to the coffee-house to dinner, he explained to Bourienne all the consequences he foresaw from the degradation of the monarchy on that fatal day, now and then exclaiming indignantly, How could they allow those despicable wretches to enter the palace? why, a few discharges of grape-shot amongst them would have quite altered the course of events, and what's more, would be running yet at this moment! He was collected and ex- tremely gay all the remainder of that day; the sight had made a deep impression upon him. He witnessed also the scenes of the 10th of August, after which he left Paris to return to the expedition to Egypt. General de St. Pierre, who held the chief authority in that island from the king and the French National Assembly, and Napoleon was appointed by him to the temporary command of a battalion of national guards. Paoli had approved of the constitutional monarchy in Corsica, and had expressed his acquiescence in the measures, nor of the attempts to establish a republic. Facts had broken out in Corsica also, which Paoli endeavoured to repress. In January, 1793, a French fleet, under Admiral Truguet, sailed from Toulon, for the purpose of attacking the island of Corsica, but the fleet was driven back by a gale; a set of wretches, the real sans culottes of Paris and other towns, who followed the army as volunteers. Throughout that frightful period which has been styled the reign of terror, it was not, generally speaking, the officers of the army who carried it out. Nevertheless, the officers of the Convention attached to the armies, who directed and presided at the massacres. There is an atrocious letter by Fouche to Collot d'Herbois, testifying his joy at the exter- mination of the rebels; and another from Saunier, Barras, and Frere, to the prosecutor of Paris, expressing their pleasure at the success of the massacre of the 31st July, 1793. (See Napoleon's Memoirs, by Gourgaud, vol. i. Appendix.) In consequence of his services at the taking of Toulon, Bonaparte was recommended by General Dugommier for promotion, and was accordingly raised to the rank of brigadier-general of artillery, in February, 1794, with the chief command of that department of the army in the south. In this capacity he inspected the coasts, ordered the weak points to be fortified, strengthened the fortifications already existing, and displayed his ability in these matters. He was then joined by General Genoa, who was stationed at the foot of the Maritime Alps, and with which he made the campaign of 1794 against the Piedmontese troops. In that campaign, the French disregarding the neutrality of Genoa, and advancing by Ventimiglia and San Remo, turned the Piedmontese position at Suorgo, obtained possession of the Col de Tende, and penetrated into the valleys on the Piedmontese side of the Alps. A battle was fought at Cairo, in the valley of the Bormida, 21st September, in which the French had the advantage. It was the means of compelling Genoa to abandon the campaign, in which Bonaparte had taken an important part, together with Massena. Previous however to the battle of Cairo, Bonaparte had had considerable risk from the factions that divided France. On the 17th November, 1794, a number of men who were superintending the operations of the army gave him a commission to proceed to Genoa, with secret instruc- tions to examine the state of the fortifications as well as the nature of the country, and also to observe the conduct of the
Genoese government towards the English and other belligerent powers. These instructions were dated Loango, and signed Ricord. Ricord and the younger Robespierre were then commissioners. Bonaparte went to Genoa and fulfilled his commission. Meantime, the revolution of the 9th of July (July 21) took place, Robespierre fell, and his party was proscribed. Attilio Sicilietti, Bartolomeo, and Laporte, were the new commissioners appointed to the army of Italy. On Bonaparte's return from Genoa to head-quarters, he was placed under arrest, his papers were sealed and an order was issued by the commissioners, declaring that he had lost their confidence by a suspicious conduct, and especially by his journey to Genoa; he was suspended from his functions of commander of the artillery, and ordered to proceed to Paris under escort to appear before the committee of public safety. This order was dated Barcelonetta, August 29. Three commissioners, and countersigned by Dumouriez, general-in-chief, Bonaparte remained under arrest for a fortnight. He wrote a pithy remonstrance, which he addressed to Attilio and Sicilietti, without taking any notice of the third commissioner Laporte. In it he complained of being disgraced, and having his character injured without trial: he appeals to his known patriotism, his services, his attachment to the principles of the revolution; he appeals to Sicilietti, who had known him he says for five years, &c. &c. He offers to resign his command to those men who are more precise an investigation of the affair, and the result was a counter order from them, dated Nice, 20th August, stating that citizen Bonaparte had been arrested in consequence of measures of general safety after the death of the then minister, M. Courtois, early 30,000 troops of the national guard had examined his conduct previous to his journey to Genoa, and also the report of that mission, had not found any positive reason to justify the suspicions they might have entertained of his conduct and principles, and that considering moreover the advantage the troops of the national guard were, with his knowledge and knowledge of the service of the republic, they, the commissioners, order him to be restored provisionally to liberty, and to remain at head-quarters until further instructions from the committee of public safety. This was followed by an order of the same date from the French republic in those times. Bonaparte however seems to have had no further annoyance on the subject. The real grounds of his accusation have never been known, and he himself, at the close of his life, professed himself to be ignorant of them (Bonaparte's Memoirs dictated to Gourgaud and Montholon).

After the close of the campaign of 1794, Bonaparte returned to Marseilles, where his family then was. It would seem that he had been superseded in his command of the army in the department of Provence, and was sent to Paris soliciting employment. Aubry, an old officer of artillery, was then president of the military committee. Bonaparte was coldly received by this officer, who made some remarks on his youth, which Bonaparte resented; Aubry then treated him as a candidate for the corps of infantry in the army of La Vendée, an appointment which he refused, considering it a sort of degradation. He remained therefore without active employment, retaining his rank of general of brigade. He now took lodgings in the Rue du Mail, opposite to the Hôtel de Victoires, and led a private life. Bourrienne states, that he had then some ideas of going into the Turkish service, and gives a copy of a project which Bonaparte laid before the war-office, showing the advantages that would result to France by forming a closer connexion with the Porte, and sending officers of artillery with a body of gunners, to the service of the Sultan. On his return to France, after the new crisis arrived in the affairs of France. The Convention had framed a new constitution, establishing a council of Elders, a council of juniors, and an executive directory of five members. This is known by the name of the constitution of the year III., and was in fact their constitution, which had been claimed since the beginning of the revolution. But the Convention, previously to its own dissolution, passed a resolution to the effect, that at least two-thirds of the members of the two legislative councils should be taken from the ministerial party, and that the directorate should be laid before the primary assemblies of the departments, and every kind of influence, legal and illegal, was used to ensure its approbation. The department of Paris however refused, and the sections or districts of that city being assembled, demanded a strict scrutiny of the returns of the votes of the assemblies of the departments, and protested against the attempt of the Convention to perpetuate its own power. They declared they would no longer obey the orders of that body. It was said that the sections were urged or encouraged in their resistance by the royalists, who hoped to derive benefit from it. But it is also well known that the Convention, meekly and timidly, like a lamb to the slaughter, unresisting the bloodshed and atrocities of the reign of terror, was odious to the Parisians. On the other side the members of the Convention for this very reason were afraid of returning to the rank of private citizens. They determined therefore to risk every thing in order to carry their object by force; they had at their disposal about 5000 regular troops in or near Paris, with a considerable quantity of artillery, and a body of volunteers from the suburbs. The command of these forces was given to Barras, a leading member of the Convention, commander in chief, and a relative of Robespierre. Barras, who had become acquainted with Bonaparte at the siege of Toulon, proposed to intrust him with the actual direction of the troops for the defence of the Convention. Bonaparte was also known to Carnot and Tallien, and other members of the Convention, as an able artillery officer. The choice being unanimously approved, Bonaparte quickly drew his line of defence round the Tuileries where the Convention was sitting, and along the adjoining quay on the north bank of the Seine. He depended mainly for his success on the passions created amid the people by the acts of the Convention, and the incitements of the Jacobins, and the terror that mounted at the head of the various avenues through which the national guards, the force of the citizens, must advance. The national guards had no cannon. They advanced on the morning of the 13th Vendémiaire (4th October, 1795), at about 30,000, and the conventicles and clubs of Parisians, arming with muskets and pikes, rushed upon the quays and the street of St. Honore. As soon as they were within musket-shot, they were ordered to disperse in the name of the Convention; they answered by discharging their firelocks, and their fire was returned by discharges of grape-shot, which drove them back into the thick masses, cooped up in narrow streets. They however returned several times to the charge, and attempted but in vain to carry the guns; the fire of the cannon swept away the foremost, and threw the rest into disorder. Filled with shame and mortification, the national guards withdrew in the evening to their respective districts, where they made a stand in some churches and other buildings; but being followed by the troops of the Convention, their disunited resistance was of no avail; they were obliged to surrender, and were marched off. By the next morning all Paris was subdued. The Convention and its troops did not use their victory with cruelty; except those who were killed in the fight, few of the citizens were put to death, and only two of the leaders were publicly executed. Barras, Murat, Veron, Marmontel, Barruyer, Verdier, and others, served with Bonaparte on the occasion, but to Bonaparte chiefly the merit of the victory was justly attributed. He was appointed by a decree of the Convention second in command of the army of the interior, and at all retaining the nominal chief command; and soon after the new constitution coming into operation, Barras being appointed one of the directors, reigned his military command, and Bonaparte became general of the interior.

About this time Bonaparte became acquainted with Josephine Beauharnois, a native of Martinique, and the widow of the Viscount Alexandre de Beauharnois. This lady had suffered imprisonment, but was liberated at fall of Robespierre. The Director Barras, an old acquaintance of her husband, frequented her, and she and Bonaparte also instituted with Madame Tallien, and other ladies of note and influence at that time. She was amiable, elegant, and accomplished. Bonaparte saw her often, and became attached to her. She was several years older than he was. He was now rapidly rising in his fortunes, and his marriage was a lady of rank and station (for rank, although nominally prescribed, began again to exercise a sort of influence in society), who was upon terms of intimacy with the political leaders of that period, could but prove advantageous to him. Such was the advice given to him by his friends, and he consented. On March 9, at a ball given by de Leyrand. Barras, having heard of the projected marriage, approved of it also. Mean time, Bonaparte had been applying to Carnot, the then minister at war, for active employment. The directors had at that time turned their attention towards Italy, where the French army, under General
Scherer, was making no great progress. After gaining a
victory over the Austrians at Loano, in November, 1795, the
French entered Genoa and Pluvione in the heart of Liguria.
This invasion was designed to check the Austrians, and
the other directors approved of it. This appointment was
signed the 23rd February, 1796; on the 9th of March follow-
ing he married Josephine, and a few days after parted from
his bride to assume the command of the army of Italy.
This story was true, but there was an inaccurate
being the condition of his appointment, and all the
inuendos built upon that assumption, appear to have no
foundation. He was appointed to the army of Italy, because
he was thought capable of succeeding, becaused by his
ability and the ground he was placed on; and it was also
thought that his Italian origin might afford him facilities with
the people of that country; and lastly, because the directors
were not sorry to have a general at the head of one of their
armies who was a man of their choice, and depended
dependent upon their favour, one whose growing reputation
might serve as a counterpart to the widely-populated
province of Moreau, Pichegru, Hoche, and the other generals
in the first years of the Republic.
The army at Bonaparte's disposal consisted of about
50,000 men; only two-thirds were fit for the field. It was
in a wretched state as to clothing, and ill
supplied with provisions; the pay of the soldiers was in
arrears, and the army was almost without horses. The
discipline also was very relaxed. The Piedmontese and
Austrians were as much at liberty as Beaulieu, a gallant veteran, past seventy years of age: it was posted
along the ridge of the Apennines, at the foot of which the
French were advancing. Bonaparte, in his despatches to the
Directorate, stated the allied armies at 75,000 men, and his
own at 30,000; but on the 3rd of March, when he
arrived at Nice, and immediately moving his head-quar-
ters to Albenga, pushed his advanced guard as far as Voltri,
near Genoa. Beaulieu, with the Austrians' left, attacked
Voltri and drove the French back; he at the same time
ordered a general retreat, after an unimportant action. Beau-
lieu descended by Montenotte upon Savona, and thus take the
French in flank. On this road the French Colonel Rampon
was posted with 1500 men on the heights of Montelegno.
He was repeatedly attacked on the 10th April by D'Argen-
teu, but stood firm, and all the assaults of the Austrians
could not dislodge him from the redoubt. This gave time to
Bonaparte to collect his forces, and to march round in the
night by Altare to the rear of D'Argenteau, whom he
attacked on every side on the following day, and obliged to
move towards Genoa. Beaulieu, after attacking the best part of his division, before Beaulieu, on the left,
crossed the river near thirty miles below Pavia. Beaulieu was now obliged to fall back upon the Adda
after a sharp engagement at Fombio, on the road from
Piacenza to Milan. Milan was occupied by the Army of
the centre of the castle. Bonaparte resolved to
Bordone near the Adda, where the Austrians
beautified with the exception of Mantua, which he blockaded. This
ended the first Italian campaign of 1796.

At the first entrance of the French the people of Lombardia showed a quiet, passive spirit. There was no
enthusiasm among them either for or against the invaders,
and they had enjoyed half a century of peace under the administra-
tion of Austria, which under Maria Theresa and Joseph had
affected many useful reforms, and acted in an enlightened,
liberal spirit. The country was rich and thriving, as it always was Bonaparte used as little force as was consistent dignity,
peace and security to property. The Milanese looked upon
the French invasion rather with wonder than either satisfaction
or hostility. Ideas of a republic existed only in a few speculative heads; but there were many who sided
with the invaders, in order to obtain the advantages as conquerors. The people of the towns behaved
hospitality to the French troops, who on their side maintained
a stricter discipline than they had done in passing through
Piedmont. But the army was to be supported, equipped,
supplied, and disciplined, and all the resources of the
Directorate and of Bonaparte. The Directory, besides,
wished to receive a share of the golden harvest to recruit its
own finances, and its orders were to draw money from all the
Italian states. Bonaparte accordingly put on Lombardy
as his department. The universal enthusiasm of the
rich proprietors on the rich proprietors and the ecclesiastical bodies.
Meantime he authorized the commissaries to seize pro-
visions, stores, horses, and other things required, giving
cheques to be paid out of the contributions. This was done
in the towns with a certain regularity, but in the country
places, away from the eyes of the general, the commissioners and soldiers often seized whatever they liked without any acknowledgment. The owners who remonstrated were insulted or ill-used; and many of the Italians calling themselves republicans assisted the French in the work of plunder, of which they took their share. The horses and carriages of the officers were drawn off, as if they belonged to the aristocrats. All property belonging, or supposed to belong, to the archduke and the late government, was sequestrated. But an act which exasperated the Milanese was the violation of the Monte di Piacé of Milan, a place of depositing money, goods, &c., which were either left for security, or as pledges for money lent upon them. The Monte was broken into by orders from Bonaparte and Saliceti, who accompanied the army as commissioners of the Directory. They seized upon this deposit of private property; and not one as it was lost to the owners but was sent them to Genoa to be at the disposal of the Directory. Many of the smaller articles belonged to poor people; many were placed there by the parents of young girls as a dowry when they came to be married. Although these smaller objects were not intended by Bonaparte to be detained, yet in the disorder of the seizure many of them disappeared, and a report spread through Milan that all had been seized. The same thing had been practised at Piacenza when Bonaparte and Saliceti passed through it; and afterwards at Parma and Piacenza. The Monte di Piacé, became a common practice of the French army in all the towns they entered.

These excesses led to insurrections in different parts of the country, in which French soldiers were killed by the patriots. The French, English, Austrian, and Bavarian troops were joined together, and a large number of men were killed, and Pavia, rose and killed a number of the French and their Italian partisans. The country people ran towards Pavia, and were joined by the lower classes of that town, who had been irritated at the hoarding of a tree of liberty in one of their streets. A number were equitably executed, and an armorer had been thrown down by the revolutionists. On the 23rd of May Pavia was in open insurrection. The French soldiers took refuge in the castle; those scattered about the town were seized and ill treated; some were killed, but most had their lives spared by the interference of the municipal magistrates and others who were friends of the people. The gates of the real hospitals were walled up, and to pass through on his way to Milan, was attacked by the frantic populace and wounded, but the magistrates, at their own risk, saved his life. In all this tumult the country people were the chief actors, by the acknowledgment of Haquin himself. Bonaparte, alarmed by this movement in his rear, and at the possibility of its spreading, determined to make an example, and "strike terror into the people," a sentence which was afterwards frequently carried into effect in the progress of his arms. A strong body of French and Bavarian troops were sent to Piacé, dispersed the inhabitants, burned the place, and then marched against Pavia, which being a walled town was capable of making some defence. Bonaparte sent thearchbishop of Milan, who, from the balcony of the town-house, addressed the multitudes, and exhorted them to lay down their arms and quietly to disperse, explaining to them the futility of their attempts at resistance. The ignorant and deluded people would not listen to his advice; the French soon forced one of the gates, and the cavalry entering the town, cut down scores, and either took prisoners or despatched them by the other gates, and left the unfortunate city to the conqueror. Bonaparte then deliberately ordered Pavia to be given up to plunder for twenty-four hours, as if Pavia had been a fortified town taken by storm, and while it was being plundered, the inhabitants, dispersed the place, burned the palace, and then marched against Pavia, which being a walled town was capable of making some defence. Bonaparte sent thearchbishop of Milan, who, from the balcony of the town-house, addressed the multitudes, and exhorted them to lay down their arms and quietly to disperse, explaining to them the futility of their attempts at resistance. This order was publicly signified to the inhabitants and the troops, and during the rest of that day, 25th May, and the whole of that night, the French soldiery were plundering and destroying within the houses of the unfortunate Pavia. Murder however was not added to pillage and rape, and it is recorded that several of the French officers and soldiers spared the honour and property of the town, and their lives by the arms of their nation. It was the case of the risk of their lives from their more brutal companions. Next morning (the 26th) at twelve o'clock the pillage ceased, but Pavia for a long time felt the effects of this cruel treatment. It is not true, as has been stated by some, that the municipal magistrates were shot; they were only sent for a time as hostages to France. Four of the leaders of the insurrection were publicly executed, and about 100 had been killed on the first interruption of the French into the city. The university and the houses of some of the professors, Spallanzani's in particular, were exempted from pillage. General Haquin, who was sent after this to Pavia as governor, endeavored to soothe the feelings of the inhabitants.

Bonaparte imposed on the Duke of Parma, who had not yet acknowledged the French Republic, a sort of peace, on condition of his paying to France a million and a half of francs, besides giving provisions, cattle, horses, cards, &c., and fifteen of his choice paintings; but as he was not quick enough in paying the whole of the money his duchy was taken from him a few months after. The Directory wanted cash, and Bonaparte says that he sent during his first Italian campaigns fifty millions of francs from Italy to Paris.

To copy the Grande Duchy of Tuscany, the Emperor of Austria, was an independent sovereign; he had long acknowledged the French Republic, and kept an ambassador at Paris; but the Directory ordered Bonaparte to seize Leghorn, and confiscate the property of the house of Austria, as belonging to the French republic. Bonaparte executed the order, took Leghorn without any opposition, put a garrison in it, seized the English, Portuguese, and other goods in the warehouses, which were sold by auction, and insisted upon the native merchants buying in the property which belonged to the enemies of the French republic. The Leghornese merchants, to avoid this odious act, agreed to pay five millions of francs, as a ransom for the whole. The pope's turn came next. That sovereignty was really in a state of hostility towards the French republic, and had never acknowledged the Republic, in consequence of the abolition of the Catholic church in France. On the 16th of June the French entered Bologna, whence Bonaparte ordered away the papal authorities, and established a municipal government. He did the same at Ferrara; and at the same time entered into insurrections on both those provinces. The Monte di Piacé of Bologna shared the same fate as that of Milan, only the deposits or pledges (not exceeding 200 livres each, 8½ sterling) were ordered to be returned to the owners. The people of Lugo, and Ravenna, were engaged against the invaders. Augereau was sent against Lugo: after a sharp fight, in which 1000 of the natives and 200 French soldiers fell, Lugo was taken, given up to plunder, and partly burnt: the women and children were spared. Proclamations were issued: every person who should take up arms against the French should be burnt, and that every individual not a regular soldier taken with arms in his hands should be put to death; and yet the French had loudly

The court of Rome was now the great alarm, and Pius VI. sent envoys to Bonaparte to sue for terms. An armistice was signed on the 23rd of June, preparatory to a definitive treaty of peace between the pope and the Directory. The principal conditions of it were that the French should give up the provinces of Ferrara and Bologna, and the cities of Ancona, should close his ports against the enemies of France, should pay fifteen millions of livres in gold or silver, and six millions in goods, provisions, horses, cattle, &c., besides surrendering a certain number of paintings, statues, vases, and 500 manuscripts, at the choice of the two commissaries sent by the Directory. This new species of spoliation, unprecedented in modern history, was brought into a regular system, and carried on in all countries conquered by the French armies. Some of the scientific and learned men of France, whom were Monge and Berthollet, went in succession to Parma, Milan, Bologna, Rome, and afterwards to Venice and Naples, to take an inventory of the works of art, from among which they chose the best, and sent them to France.

While these things were going on south of the Po, the
court of Vienna was preparing a fresh army for the recovery of Lombardy. Marshal Wurmser, a veteran officer of considerable reputation, was detached with 50,000 men from the Army of the Rhine to reinforce the Emperor in Tyrol, where he collected the remains of Beauhain's troops and the Tyrolese levies, forming altogether an army of between 50,000 and 60,000 men. Bonaparte's army was not quite 50,000, of which part was stationed round Mantua to hold the passes of the Alps, and the rest before Verona and Vincenza. Towards the end of July, Wurmser, with the main body of his troops, advanced from Trento by the eastern shore of the Lake of Guards, towards Verona, while another corps under Quosnadowich marched by the western shore to Salò and Brescia, and by the two places it discovered the French away. Bonaparte, after some hesitation, hastily raised the siege of Mantua, leaving his battering train, and collected the best part of his forces to meet Quosnadowich as the weaker of the two generals. He attacked him at Lonato, drove him back into the mountains, and then turned quickly to the right to face Wurmser, who, having passed Verona, had entered Mantua, destroyed the French entrenchments, and was now advancing by Castiglione, from whence he had driven away the French under General Valette. This was a critical moment in Bonaparte's career, and it is said he was in doubt whether to fall back on the Po, but was dissuaded by Augereau. On the 3rd of August the French retook Castiglione after an obstinate combat. Wurmser however took up a position near the town, where he placed his right on the 29th, and the Emperor's forces were, with the loss of his cannon and several thousand men, Wurmser withdrew beyond the Mincio, and afterwards up the Adige into the Tyrol, followed by the French, who attacked and defeated an Austrian division at Roveredo on the 4th of August. Bonaparte then changed his position, and suddenly crossed the mountains that divide the valley of the Adige from that of the Brenta, and entered Bassano, where he joined by some reinforcements from Carinthia, intending to march down again towards Verona and Mantua. But the Emperor forced him quickly by the same road, and attacked and routed him at Bassano. Wurmser had now hardly 16,000 men left, and his artillery being lost, and his retreat cut off, he took the bold resolution to cut his way to Mantua, and shut himself up in that fortress. With a rapidity of movements the French divisions, and the intricacy of their manoeuvres, can only be appreciated by a description of the events of the 14th and 15th. A third general and a third army were sent by Austria into Italy in the autumn of the same year. Marshal Alvinzi, an officer of some reputation, advanced from Carinthia by the way of Belluno with 30,000 men, while General Daviukovich, with 20,000, descended from the Tyrol by the valley of the Adige. They were to meet between Peschiera and Verona, and proceed to relieve Wurmser at Mantua. Bonaparte, who was determined to attack Alvinzi before he could form his junction, gave him battle at Le Nove, near Bassano, on the 14th September. Hereupon the higher efforts of Massena and Augereau, he could not break the Austrian line, and next day he retreated by Vicenza to Verona. On the same day Vaubois, whom Bonaparte had overlooked, was driven away from Trento and Roveredo with great loss, and obliged to fall back to Rivoli and La Corona. Had Daviukovich followed up his success, he might have pushed on to the plains on the right bank of the Adige near Verona, and have placed Bonaparte in the dilemma of what to do. But on the 14th, with Alvinzi on his left flank, Daviukovich in his rear, and instead of advancing, Daviukovich stayed ten days at Roveredo. Alvinzi meantime had advanced by Vicenza and Villanova to the heights of Calidoro facing Verona, where he waited for Daviukovich's appearance. Bonaparte attempted, on the 12th November, to dislodge Alvinzi from Calidoro, and in the attempt he lost he was obliged to withdraw his troops again into Verona. He wrote next day a desponding letter to Paris, in which he recapitulates his losses, his best officers killed or wounded, his soldiers exhausted by fatigue, and himself in danger of being surrounded. He however determined to make a last effort to dislodge Alvinzi by turning his position. With two divisions under Massena and Augereau, he attacked Alvinzi on the 15th, followed the right bank of the Adige, crossed that river at Ronce early next morning, and moved quickly by a cross road leading through a marshy country towards Villanova in the rear of Alvinzi, where the Austrian baggage, stores, &c., were entrenched. He captured the post of Ronta, and advanced by surprise between the French and Villanova. The French attempted to pass it by the bridge of Arcole, but found it defended, and this led to the celebrated battle of that name, which lasted three days, and which was unquestionably the hardest fought in all those which fall under the name of the Austrian War. On the 17th Bonaparte succeeded in turning the position of Arcole, when Alvinzi thought it prudent to retire upon Vincenza and Bassano, where the Austrians took up their winter quarters. Bonaparte wrote to Carnot after the action of the third day: 'Never was a field of battle so exhausted and contested: our enemies were numerous and determined. I have hardly any general officers left.' They were almost all killed, wounded, or prisoners.

On the same day that Bonaparte obliged Alvinzi to retire from the Adige, Daviukovich, rousing himself from his incognito inaction, pushed down by Aila on the Adige, drove Vaubois before him, and entered the plains between Peschiera and Verona. But it was now too late; Bonaparte turned against him, and obliged him quickly to retreat his army back to Roveredo. Thus ended the third campaign of the year 1796.

Bonaparte had now some leisure to turn his attention to the internal affairs of the conquered countries. The Milanese in general remained passive, but the people of Milan were eager to be admitted into an independent state. Bonaparte himself had not directly encouraged such manifestations, but his subalterns had; and indeed the revolt of Reggio, which was the first Italian city that proclaimed its independence, was begun by a body of Corsican pensioners, who were passing through on their way to the army. (Count Paradisi, Lettera a Carlo Rotta.) Bonaparte allowed Modena, Reggio, Bologna, and Ferrara to form themselves into a republic, which was called Cispadene. As for the Milanese, the Directory wrote that the acts of the Reggio were innovations which it was necessary to restore that country to the emperor at the peace. Bonaparte has clearly stated his policy at that time towards the North Italians in a letter to the Directory 28th December, 1796. 'There are in Lombardy (Milanese) three parties: 1st, the friends of the old governments; 2nd, which aims at liberty and a national government, and that with some degree of impatience; 3rd, the party friendly to Austria and hostile to us. I support the first, restrain the second, and put down the third. For the moment I have no care of the third. But there are also three parties: 1st, the friends of the old governments; 2nd, the partizans of a free constitution, though somewhat aristocratical; 3rd, the partizans of pure democracy. I endeavour to put down the first; I support the second because it is the party of the great proprietors and of the clergy, who exercise the greatest influence over the masses of the people, whom it is our interest to win over to us; I restrain the third, which is composed chiefly of young men, of writers, and of people who, as in France and elsewhere, love liberty merely for the sake of revolution.'

The pope found that he could not agree to a peace with the Directory, whose conditions were too hard, and consequently, after paying five millions of livres, he stopped all further remittances. Bonaparte, after discovering in his dispatches the abruptness of the Directory, and saying that it was impolitic to make too many enemies at once while Austria was still in the field, repaired to Bologna in January, 1797, to threaten the Roman states, when he heard that Alvinzi had crossed the Adige and was marching down to Roveredo. The Austrian marshal had received reinforcements which raised his army again to 50,000 men. He marched them in several columns, threatening several points at once of the French line on the Adige, and Bonaparte for awhile kept him where he was, making no attempt to stop him. He learnt however through a spy that the main body of Alvinzi was moving down from the Tyrol along the right bank of the Adige upon Rivoli, where Joubert was posted. On the 13th Bonaparte hurried from Verona with
Massena's division to Rivoli, and on the 14th the battle of Rivoli took place. Alivini, calculating upon having before him only a retreat, had extended his line with the view of surrounding Massena and cutting off his retreat by a detachment of Austrians, and twice retreated by the French, Massenas, and afterwards Ney, with his division, coming to Joubert's assistance, carried the day. Alivini's scattered divisions were broken and driven, and Massena himself, who had seen his division under General Provera had most fortunately escaped the attack of Garibaldi and Wurmser, and arrived outside of Mantua, where Provera attacked the entrenchments of the besiegers, while Wurmser made a sortie with part of the garrison. Massena, with a small force of Austrians, was at the battery driven back to Belluno at the foot of the Neric Alps. Soon after, Wurmser being reduced to extremities for want of provisions, the garrison having exhausted their last supply of horse-flesh, and being much reduced by disease, offered to capitulate. The Austrian soldiers, especially in their hurried retreats, when discipline became relaxed, plundered and killed on the way; the French plundered, violated the women and committed every sort of excess in the villages and scattered habitations; the towns were laid under a regular system of plunder by the French commissaries, by requisitions of provisions, clothes, horses and carts, and forced contributions of money. At the same time the greater part of the men of the flower of the army were butted little to the comforts of the soldiers, but went to enrich commissaries, purveyors, contractors, and all the predatory crew that followed an invading army. Bonaparte, although he had not been able to defend the states of former years, was strengthened by the flight of those troops that had survived the disasters of the former campaigns. Bonaparte, on the contrary, had an army now superior in number to that of the Austrians, flushed with success, and reinforced by a corps of 20,000 men from the Rhine under the command of General Gourgaud. Bonaparte attacked the archduke on the river Tagliamento, the pass of which he forced; he then pushed on Massena, who forced the pass of La Pontebba in the Neric Alps, which was badly defended by the Austrian General Qazda. The archduke was met by a multitude where he fought in person; but was at last obliged to retire, which he did slowly and in an orderly manner, being now intent only on gaining time to receive reinforcements and to throw the greater part of his army into a position to advance rapidly upon the capital of Austria and to frighten the emperor into a peace. He was not himself very secure concerning his rear, as he could not trust in the neutrality of Venice which he himself openly violated. He was also informed that an Austrian column under General Laudon, after driving back the French opposed to it, had advanced again by the valley of the Adige towards Lombardy. Had this movement been supported by a rising in the Venetian territory, Bonaparte's communications and that of the emperor, between the two countries, would have been dispersed by the spirit of theideas he held of Italy. The archduke at length, pressing in upon me, sent me a letter from the emperor, saying: "You are an traitor to the republic. Who are you to conquer, your own Germany will feel all the ravages of war. Cannot we come to an amicable understanding? The French Directory wishes for peace. . . ." To this note the archduke returned a civil answer, saying he had no commission for treating of peace, but that he had written to Vienna to inform the emperor of his (Bonaparte's) overtures. Meantime Bonaparte continued to advance towards Vienna and the archduke to retire before him, without any great advantage to the latter. It would have been better that the archduke's advice was to draw the enemy farther and farther into the interior of the hereditary states, and then make a solid stand under the walls of Vienna, while fresh troops would have time to come from Hungary and from the Rhine, and the whole population would rise in the rear of the French army and place Bonaparte in a desperate situation. But there was a party at the court of Vienna anxious for peace. Bonaparte had now arrived at Judenberg in Upper Austria, about eight days' march from Vienna. The citizens of that capital, under their walls for more than a century, were greatly alarmed. The cabinet of Vienna resolved for peace, and Generals Bellegarde and Meerfeldt were sent to Bonaparte's head-quarters to arrange the preliminaries. It would have been better that the negotiations began at the village of Lobon, and the

No. 287. [THE PENNY CYCLOPEDIA.]

VOL. V.-R

The penal troops, to the number of about 8000, were posted along the river Semin between Imola and Faenza, but after a short resistance they gave way before the French, who immediately occupied those places, and the Marquis of Tolomei, where he received deputies from Fiume VI, who sued for peace. The conditions dictated were fifteen millions of livres, part in cash, part in diamonds within one month, and as many again, within three months; the cession of the town of Ancona till the general peace, and an additional number of paintings, statues, and MSS. On these terms the pope was allowed to remain at Rome a little longer. The Directory wished at first to remove him altogether, but Bonaparte, fearing the importance of religion and the influence over nations, and he treated the pope's legate, Cardinal Mattei, with a courtesy that astonished the free-thinking soldiers of the republic.

Austria had meantime assembled a new army on the Rhine, and Bonaparte was given to the Archduke Charles, who had acquired a military reputation in the campaigns of the Rhine. But this fourth Austrian army no longer consisted of veteran regiments like those that had fought under Beauju, Wurmser, and Alivini; it was recruited at the expense of those troops that had survived the disasters of the former campaigns. Bonaparte, on the contrary, had an army now superior in number to that of the Austrians, flushed with success, and reinforced by a corps of 20,000 men from the Rhine under the command of General Gourgaud. Bonaparte attacked the archduke on the river Tagliamento, the pass of which he forced; he then pushed on Massena, who forced the pass of La Pontebba in the Neric Alps, which was badly defended by the Austrian General Qazda. The archduke was met by a multitude where he fought in person; but was at last obliged to retire, which he did slowly and in an orderly manner, being now intent only on gaining time to receive reinforcements and to throw the greater part of his army into a position to advance rapidly upon the capital of Austria and to frighten the emperor into a peace. He was not himself very secure concerning his rear, as he could not trust in the neutrality of Venice which he himself openly violated. He was also informed that an Austrian column under General Laudon, after driving back the French opposed to it, had advanced again by the valley of the Adige towards Lombardy. Had this movement been supported by a rising in the Venetian territory, Bonaparte's communications and that of the emperor, between the two countries, would have been dispersed by the spirit of the ideas he held of Italy. The archduke at length, pressing in upon me, sent me a letter from the emperor, saying: "You are an traitor to the republic. Who are you to conquer, your own Germany will feel all the ravages of war. Cannot we come to an amicable understanding? The French Directory wishes for peace. . . ." To this note the archduke returned a civil answer, saying he had no commission for treating of peace, but that he had written to Vienna to inform the emperor of his (Bonaparte's) overtures. Meantime Bonaparte continued to advance towards Vienna and the archduke to retire before him, without any great advantage to the latter. It would have been better that the archduke's advice was to draw the enemy farther and farther into the interior of the hereditary states, and then make a solid stand under the walls of Vienna, while fresh troops would have time to come from Hungary and from the Rhine, and the whole population would rise in the rear of the French army and place Bonaparte in a desperate situation. But there was a party at the court of Vienna anxious for peace. Bonaparte had now arrived at Judenberg in Upper Austria, about eight days' march from Vienna. The citizens of that capital, under their walls for more than a century, were greatly alarmed. The cabinet of Vienna resolved for peace, and Generals Bellegarde and Meerfeldt were sent to Bonaparte's head-quarters to arrange the preliminaries. It would have been better that the negotiations began at the village of Lobon, and the
liminaries of the peace were signed by Bonaparte on the 16th. Of the conditions of this convention some articles only were read to the public, viz.: that the Emperor Ferdinand should be the emperor of the Austrian Netherlands and of Lombardy. The secret articles were that Austria should have a compensation for the above losses out of the territory of neutral Venice. This is a transaction which has been loudly stigmatized as an infraction of the pact. The palliation attempted by Bonaparte's advocates, who pretend that the Venetian senate had first violated their neutrality, and that they had organized an insurrection in the rear of the French army while Bonaparte was engaged with the Archduke Charles, or the Emperor Ferdinand, will be best investigated in treating of Venice. [Venice.] Meantime we can only refer our readers to the Raccolta di documenti inediti che formano la Storia diplomatica della rivoluzione e caduta della Repubblica di Venezia, 2 vols. quarto, of Dami and Dalmatia, which contains a detail in his Histoire de Venise. A careful attention to dates is sufficient to refute every attempt to palliate the dishonesty of the French Directory and of Bonaparte in their conduct towards Venice. The correspondence of Bonaparte, published by M. de la Hontiécourt, serves to confirm this view of the events. It says that he seized upon the opportunity of the Austrians having entered Peschiera by stratagem, and without the Venetian senate's consent, in order to frighten the senate into submission to his will. If your object, as said to the Austrian ambassador, was to punish Venice, you have now a fair pretence for it. If you have further views respecting Venice, we may protract this subject of complaint until more favourable opportunities. This was written in June, 1796. He then seized upon the estates of the nuncio of the Church of Venice, and other fortified places of the Venetian state, he made the country support his army, and meantime he favoured the disaffected against the senate, who at last, assisted by the Lombards and Poles in his army, revolted at Bergamo and Brescia, and drove away the Venetian authorities. When the senate armed to put down the insurrection, the French officers stationed on the Venetian territory obstructed its measures, and accused it of arming against the French. They dispersed by force the militia assembled for the purpose, of which the mayor of Padua himself was a member. The conduct of the French having driven the people of Verona to desperation, a dreadful insurrection broke out in April, 1797, which ended by Verona being plundered by the French. Bonaparte now insisted on a total change in the Venetian government, and a view of troops being repulsively introduced into Venice, the Doge and all authorities resigned. A provisional government was then formed, but meantime Bonaparte barred away Venice to Austria, and thus set up a government opposing the aristocratic politicians. He wrote to the Directory 'that the Venetians were not fit for liberty, and that there were no more than 300 democrats in all Venice.' By the definitive treaty of peace signed at Campoformio near Udine on the 17th October, 1797, the emperor Ferdinand yielded the whole of the territory of the Rhine with the city of Mainz; he acknowledged the independence of the Milanese and Mantuan states under the name of the Cispinale republic; and he consented that the French republic should have the Ionian Islands and the Venetian possessions in Albania. The French republic on its part consented (such was the word) that the emperor should have Venice and its territory as far as the Adige, with Istria and Dalmatia. The provinces between the Adige and the Adda were to be incorporated with the Cispinale, the province of the Adda was to have an increase of territory at the expense of the elector of Bavaria, and the Duke of Modena was to have the Brugia.

All this time the democrats of Venice were still thinking of a republic and independence; they had planted, with great solemnity, the tree of liberty in the square of St. Mark, and the French garrison grazed the show. Bernadotte, who knew the conditions of the treaty, forbade a similar pageant at Udine, where he commanded; but another French commander put a heavy contribution on a small town of the Paduan district, 'because the inhabitants had cut down their tree of liberty.' At last the time approached when the French were to evacuate Venice. Bonaparte wrote to Villettard, the French secretary of legation, a young enthusiastic republican, who had just been a martyr to the Venetian revolution, that all the Venetian democrats who chose to emigrate would find a refuge at Milan, and that the naval and military stores and other objects belonging to the late Venetian government must not be burned for their support. Villettard communicated this last proposal to the municipal council, but it was at once rejected; 'they had not accepted,' they said, 'a brief authority for the sake of conciliating in the spoliations of their country. They had been too long, you know, kept in the dark by their guilty allies'; and they gave in their resignation. Villettard, sincere in his principles, wrote a strong letter to Bonaparte, in which he made an affecting picture of the despair of these men, who had trusted in him and now found themselves cruelly deceived. This was the sort of answer which has been often quoted for its unfeeling sneering tone. 'I have received your letter, but do not understand its contents. The French republic does not make war for other people. We are under no obligation to the duchy of Savoy, to pay the price of the destruction of the free state of France, to please a band of declaimers whom I should more properly qualify as madmen, who have taken a fancy to have a universal republic. I wish these gentlemen would try a warmer campaign with me.... And then he went on nobbling on the words of his treaty. The French republic did not deliver Venice into the hands of Austria; that when the French garrison evacuated the place and before the Austrians came, the citizens might defend themselves if they thought proper, &c. &c. As for the cannons, the Austrians sent home, the cannons and other arms removed, the fleet carried off by the French to Corfu, Istria, and Dalmatia already occupied by the Austrians, and the country drained of all resources. However, Serrurier was ordered to the island of Loano, and Bonaparte completed the departure of the fleet, emptied the arsenals, and the stores of biscuit and salt, having sent to sea the ships of war, sunk those that were not fit for sea, and stripped the famous state barge called Bucentoro of all its ornaments and gold, he departed with the French garrison, and the magnificent island of Venice was entered. The Venetian senator Pesaro came as imperial commissioner to administer the oaths. The late Doge Marin while tendering his oath fell into a swoon, and died soon after. Thus ended the republic of Venice, after existing 1100 years. Only the naval power of Italy became extinct, and Italy lost the only colonies which she still possessed.

During the several months that the negotiations for the peace lasted, Bonaparte had time to effect other changes in Italy. He began with Genoa, and the massacres of the democrats. The king of Sardinia, by a treaty with the French Directory, remained for the present in possession of Piedmont. Bonaparte showed a marked favour towards that sovereign; he spoke highly of the Piedmontese troops, and wrote to the Directory that the king of Sardinia with one regiment was stronger than the whole Cispinale republic. Insurrections broke out in several towns of Piedmont, which Bonaparte however openly disconcerted, professing, at the same time, a deep regard for the House of Savoy. His orders for the Massacre of the democrats were made public, and the insurgents having thus lost all hope of support from him, were easily subdued by the king's troops, and many of them were executed. Thus at one and the same time the democrats of Genoa were encouraged by Bonaparte, those of Piedmont were abandoned to the severity of the king, those of Venice were
given up to Austria, and those of Lombardy were despoiled. Bonaparte wrote to the Directory that he had with him only 1500 Cisalpine soldiers, the refuse of the towns, that no reliance could be placed on the democrats, who were but a handful, and that it was not for the present of the French they would be all murdered by the people. (Bonaparte's Correspondance.) He however thought proper to consolidate the Cisalpine republic, and to give it a constitu-
tion. Henceforth, the local authorities were to take care of property, men of science, or men who had distinguished themselves in their respective professions. The republic consisted of the Milanese and Mantuan territories, of that part of the Venetian territory situated between the Adda and the Po, a small part of the Grand Duchy of Milan, and the papal provinces of Bologna, Ferrara, Ravenna, Faenza, and Rimini, as far as the Rubicone. Tuscany, Parma, Rome, and Naples remained under their old princes; all, however, with the exception of Naples, in complete submission to France.

In all these important transactions Bonaparte acted almost as if he were uncontrolled by any authority at home, and often at variance with the suggestions of the French Directory. How it was that Bonaparte did not immediately return to France, is not easy to explain. He was in fact the umpire of Italy. He at the same time supported the power of the Directory in France by offers of his services and addresses from his army, and he sent to Paris Augereau, who sided with the Direc-
tory. He was not only fighting out his own battles, but was also evincing on several occasions but an indifferent opinion of the Directory, calling it a government of lawyers and rhetoricians, unfit to rule over a great nation. (Bourienne, and Napoleon's Memoires by Gourgaud, &c.) He flatly refused, after his first Italian victories, to divide his command with Kollerern; he strongly censured the policy of the Directory with the Italian powers; he signed the preliminaries of Leoben, and withdrew his army from the hereditary states, without waiting for the Directory's ratification. He insisted upon having the regulations that he had made with the Emperor in his resignation if not allowed to do so; he made that peace on his own conditions, though some of those were contrary to the wishes expressed by the Directory, and in the end the Directory approved of all he had done. 'It was a peace worthy of Bonaparte. The Italians may perhaps break out into vociferations, but that is of little con-
squence.' Such were the words of the Directory's minister for foreign affairs, Talleyrand. (Bonaparte's Correspondance.)

After the treaty of Campo Formio Bonaparte was appointed minister plenipotentiary of the French republic at the con-
gress of Rastadt for the settlement of the questions concern-
ing the German Empire. He now took leave of Italy and arrived at Paris, where he arrived in December, 1797. He was received with the greatest honour by the Directory; splendid public festivals were given to the conqueror of Italy; and writers, poets, and artists vied with each other in celebrating his triumphs. Bonaparte was given an ovation and a standing ovation. He however appeared distant and reserved. He was appointed general in chief of the Army of England, but after a rapid inspection of the French coast and of the troops stationed near them, he returned to Paris. The expedi-
tion of Egypt was then secretly contemplated by the Directory. A project concerning that country was found in the archives among the papers of the Duke de Choiseul, minister of Louis XV., and it was revived by the ministers of the Directory. The Directory on their part were not sorry to remove from France, a man whose presence in Paris gave them uneasiness; and Bonaparte warmly approved of a plan which opened to his view the prospect of an inde-
pendent command, while visions of an Eastern empire floated before his mind. He had in his composition some-
thing of that vague enthusiasm of the imagination for remote countries and high-sounding names. At the same time he saw there was nothing at present in France to satisfy his excited ambition, for he does not seem to have thought as yet of the possibility of his attaining supreme power. He believed the French nation, foreseeing that its government must undergo further changes. The expedition having been got ready, partly with the

The fleet arrived before Malta on the 9th of June. The Order of St. John of Jerusalem, as it was called, had never acknowledged the French republic, and were therefore considered by France as enemies. The British fleet, under Nelson, had been asked to go to the assistance of the Order, and Nelson, who was a strong advocate of the abolition of slavery, had at once given his consent. He arrived at Malta on the 6th of June, and after the blockade of the island for two days, the British fleet sailed on board the admiral's ship *L'Orient* in the night of the 19th May, while Nelson's blockading fleet had been forced by violent winds to remove from that coast. The destination of the French fleet was kept a profound secret: 2000 men, chiefly from the army of Italy, composed the land force.

The fleet arrived before Malta on the 9th of June. The Order of St. John of Jerusalem, as it was called, had never acknowledged the French republic, and were therefore considered as enemies. The British fleet, under Nelson, had been asked to go to the assistance of the Order, and Nelson, who was a strong advocate of the abolition of slavery, had at once given his consent. He arrived at Malta on the 6th of June, and after the blockade of the island for two days, the British fleet sailed on board the admiral's ship *L'Orient* in the night of the 19th May, while Nelson's blockading fleet had been forced by violent winds to remove from that coast. The destination of the French fleet was kept a profound secret: 2000 men, chiefly from the army of Italy, composed the land force.
of musketry and grape shot made fearful havoc among them; and after losing most of their men in desperate attempts to break the French ranks, the remnants of this brilliant cavalry retreated towards Upper Egypt; others crossed the Nile, and retreated towards Syria. This was called the battle of the Pyramids, and was unequivocally a defeat. The French soldiery had won victories too cheaply bought over a barbarian cavalry unequipped with European tactics. Bonaparte two days after entered Cairo without resistance, and assembled a divan or council of the principal Turks and Arab sheiks, who were to have the direction of the country. He pro-

duced a determination to administer equal justice and protection to all classes of people, even to the humblest Fellah, a thing unknown in that country for ages. He established an institute of sciences at Cairo; and he en-
doctrined the people with new good customs, and in the imams, and to some extent he succeeded. It is not true however that he or any of his generals, except Menou, made profession of Islamism. The report originated in a desultory conversation he had with some of the sheiks, who hinted at the advantages that might result to him and his army from the adoption of the religion of the country. It was however a wild idea, unsuited both to him and the sort of men he commanded. It would have made him ridiculous in the eyes of his troops, and would have probably conciliated the Moslem natives. While he was engaged in organizing the internal affairs of Egypt, the destruction of his fleet by Nelson took place in the roads of Aboukir on the 1st and 2nd of August. He was now shut out from all communication with Europe. The French then issued an indignant manifesto, dated 10th September, de-

clairing war against France for having invaded one of his provinces, and prepared to send an army for the recovery of Egypt. A popular insurrection broke out at Cairo on the 22nd of September. The revolutionists plundered the streets were killed. Many however, and especially the women and children, were saved in the houses of the better sort of inhabitants. (Denon’s account of that event.) Bonap-

parte, who was absent, returned quickly with troops; the insurrection was quelled, and the streets took refuge in the Great Mosque, the doors of which they barricaded. Bonaparte ordered them to be forced with cannon. A dreadful massacre ensued within the mosque, even after the bombardment. Five thousand Moslems were killed on that day. Bonaparte then issued a proclamation, in which, imitating the Oriental style, he told the Egyptians that he was the man of fate who had been foretold in the Koran, and that any resistance to him was in vain and fruitless; and he appealed to them as to their most secret thoughts, as nothing was concealed from him.

In the month of December Bonaparte went to Suez, where he received depositions from several Arab tribes, as well as from some Egyptians, who, while giving protection to the great caravan of the pilgrims proceeding to that sanctuary. From Suez he crossed, at ebb tide, over the head of the gulf to the Arabian coast, where he received a deposition from the monks of Mount Sinai. On his return to Suez he was overtaken by the rising tide, and was in some danger of being drowned. This he told Las Cases at St. Helena.

Meantime the Turks were assembling forces in Syria, and Djezzar Pacha of Arabia appointed vassal and commander. Bonaparte resolved on an expedition to Syria. In February, 1799, he crossed the desert with 10,000 men, took El Arish and Gaza, and on the 7th March he stormed Jaffa, which was bravely defended by several thousand Turks and Arabs, and the British had sent a small garrison under General Bosc on, just off the head of the messenger. A great number of the garrison were put to the sword, and the town was given up to plunder, the horrors of which Bonaparte himself in his dispatches to the Directory acknowledges to have been frightful. The Turks were all sent to Damascus, and many men were quartered in the fort and other buildings, until at last they surrendered as prisoners. They were then mustered, and the natives of Egypt being separated from the Turks and Arousauts, the latter were put under a strong guard, but were supplied with provisions. So, two days after, on the 9th, this body of prisoners was marched out of Jaffa in the centre of a square battalion commanded by General Bon. They proceeded to the sand-hills S.E. of Jaffa, and there being divided into small bodies, they were put to death in masses by volleys of musketry. Those who fell wounded were finished with the bayonet. The bodies were heaped up into the shape of a pyramid, and their bleached bones were still to be seen not many years since. Such was the massacre of Jaffa, which Napoleon at St. Helena pretended to justify by saying that these men had formed part of the garrisons of El Arish and Gaza, upon transports of which they had been allowed to return home on condition of not serving against the French;—on arriving at Jaffa however, through which they must pass, their countrymen retained them to strengthen the defence of that place. It may be seen that Napoleon did not like his men, who were the identical men of El Arish or Gaza. But however this may be, it is true that the Turks did not at that time observe the rules of war among civilized nations, and therefore, it may be said, were liable to be treated with the utmost severity in case of fresh encounters. This massacre, because done in cold blood and two days after their sur-

render. The motive of the act however was not wanton cruelty, but policy, for getting rid of a body of deter-

dined men, who would have exerted the French as prisoners, or increased the ranks of their enemies if allowed to live. This is the only apology, if apology it be, for the deed.

Another and a worse reason was, the old principle of Bonaparte’s striking terror into the country which he was invading. A number of Turks of the old and experienced sort, with the North Italians or the Fellahs of Egypt, failed of its effect when applied to the Turks or the Arabs; it only made them more desperate, as the defence of Acre soon after proved. Most in his Memoirs has, it seems, made a mistake as to the number of the garrisons of the forts; he states that at two or three thousand; they were about 1200.

At Jaffa the French troops began to feel the first attack of the plague, and their hospitals were established in that town. On the 14th the army marched towards Acre, which they reached on the 16th. The 10 August, Acre was invested. A severe battle was fought on the 1st September, but the French, in spite of all their efforts, were unable to take the city, and finally it surrendered on the 20th. Of the garrison of Acre 7,120 were slain. This was a signal victory for the Emperor of France. After this he was at once recognized by all the powers; the other attempts Bonaparte ordered an assault on a wide breach which had been effected in the curtain. General Lannes led the column. Djezzar gave orders to let the French come in, and then close upon them man against man, in which sort of combat the Turks were sure to have the ad-
among the rest, who examined the monuments of Thebes, Dendera, Ebfou, &c. From their observations the splendid work on Egypt was afterwards compiled.

Towards the end of July Bonaparte being informed that the Turkish fleet had landed 18,000 men at Aboukir, under Seid Mustapha Pacha, immediately assembled his army to attack them. He had formed a cavalry, which was commanded by Murat; the Turks had none. The Turks had entrenched themselves not near enough to the coast to attack their advanced posts and drove them back upon their entrenchments; but the Turkish guns checked their advance, and threw the foremost of the assailants into disorder. The main body of the Turks then sailed out, but in the eagerness of pursuit the French found they were charged by the French, both infantry and cavalry, routed, and followed into their entrenchments, where they fell into inextricable confusion. About 10,000 of them took to the sea. Only about 4,000 were captured, and they appeared covered with their turbans. Six thousand men received quarter, together with the pachas, whom Bonaparte condescended to praise for the courage he had displayed. This victory of Aboukir, fought on the 2nd July, 1799, closed Bonaparte's Egyptian campaign. It was not only a victory that Bonaparte received intelligence of the state of France, through the newspapers, and also by letters from his brothers and other personal friends. He learnt the disasters of the July revolution, the loss of Italy, the insurrection, and the faction prevailing in France against the Directory, and the intrigues and animosities among the directors themselves, and between them and the legislative councils. He determined at once to return to France. He kept it however a secret, and ordered the British fleet under Lord Byron to lie off the crossing of Alexandria to be got ready for sea, and having ordered his favourite officers, Murat, Lannes, Berthier, Marmont, and also MM. Monge, Denon, and Berthollet to meet him at Alexandria, he left Cairo on the 15th August, and on the 23rd boarded the frigate La Muiron on the 23rd. He took leave of Kleber, whom he left in command, only by letter. He left in Egypt 20,000 men, having lost about 9000 in his campaigns. The English fleet had gone to Cyprus to get provisions, and the British squadron, under Reynolds, was lying in the road of the English cruisers. It is said he has read during the passage both the Bible and the Koran with great assiduity. On the 30th September the two frigates entered the gulf of Ajezoio; on the 7th October they sailed again, and passing unnoticed through the English squadron, they anchored on the 9th in the gulf of Frejus, to the eastward of Toulon. The usual forms of quarantine were dispensed with, and on his landing he was received with applause by the inhabitants. In the various towns on his road to Paris, he was received with great enthusiasm, especially at Lyon, where the Rhone had broken its banks. People were tired of the Directory, which had shown both incapacity and corruption, and to which they attributed all the late misfortunes of France. [BARRAS.] The Directory was sitting for a change, and had already the sound of a storm. He was received with great enthusiasm by the people. Bonaparte decided on joining Sieyes, and giving him his military support; the day for attempting the proposed change in the constitution was fixed between them and their friends.

The Council met at six o'clock in the morning of the 18th Brumaire (9th Oct. 1799) at the Tulleries; but several of the leading members of the republican party were not summoned. Cornudet, Lebrun, and other members in the interest of Sieyes, spoke of dangers which threatened the Republic, of corruption among the Directory, of a return of the reign of terror, &c. The majority of the council were either in the secret, or were really agitated by fear of the Jacobins. The council adopted a resolution, according to the powers given to it by the constitution, by which the two councils were appointed to meet at St. Cloud the next day, in order to be safer from any attempts of the
mob of the capital. By another resolution General Bonaparte was authorized to suppress in arms, on his own responsibility, Paris, and charged with protecting the safe removal of the council. A message signifying this appointment, and summoning him to appear before the elders, was carried to Bonaparte while he was in the midst of his military labors. The attachment of his friends, his family, his friends, and all the officers to follow him. The greater number did so; but Bernadotte and a few more declined the invitation. Bonaparte had been talking privately with Bernadotte, but could not win him over to his side; he found him 'as stiff as a bar of iron.' Bonaparte had given his orders to the adjutants of the various battalions of the national guards and to the commanding officers of the regular troops which were formed in the Champs Elysées, repaired to the Council of Elders, surrounded by a numerous retinue of officers, and was received by M. Murat, and Le Fèvre, who commanded the National Guards. He told the council that they represented the wisdom of the nation, that by their resolutions of that morning they had saved the Republic, that he and his brave comrades would support them, and signified this in his address names. Coming out of the hall he read to the assembled troops the resolutions of the elders, which were received by the soldiers with bursts of applause.

Meantime the three directors, Barras, Mounier, and Cuautemoc at the Luxembourg, after Sieyes and Ducos had gone to the Tuileries, and given in their resignation, became alarmed. They had no force at their disposal; even their own personal guard had deserted them. Barras sent his secretary Botot to endeavour to negotiate with the directors, in the name of the National Guards, in the midst of his officers, and assuming the tone of an angry master upbraided the directors with their misconduct:

'What have you done with that France which I left to you preserved to the last grain? I leave it at peace; and I find her at war; I leave her triumphant, and I find nothing but spoils and misery. What have you done with a hundred thousand Frenchmen whom I left behind, my companions in arms and in glory? They are no more....'

For ten minutes, in the name of the National Guards, M. Botot pressed the ministers towards Barras, and assured him of his personal protection if he immediately abdicated. Talleyrand had meantime seen Barras, who, fearing perhaps to expose himself to an investigation of his official conduct, consented to resign. He wrote a letter to the Council of Elders to that effect, and then set off for his estate in the country under an escort which Bonaparte gave him. [BARRAS.] Ghioria and Mounier being thus left alone did not constitute the number required by the constitution in order to give their de- lict, and consequently an examination of an executive act of the three is to be sent by Bonaparte to guard the palace of the Luxembourg, and in fact to keep the two directors prisoners there.

The Council of Five Hundred having met at 10 o'clock on the same day, received a message from the elders, adjourning the sitting to St. Cloud for the next day. They separated amidst cries of 'The Republic and the Constitution for ever!'

Fouché, the minister of police, Cambacérès, minister of justice, Talleyrand, and other influential men, seconded the views of Bonaparte and of Sieyes. The power of the directory was at an end. The question was, what form of government should be substituted for it. It was agreed at last that the council should adjourn themselves to the following year, after appointing a commission for the purpose of framing a new constitution, and that meantime an executive should be formed consisting of three consuls, Sieyes, Ducos, and Bonaparte. These measures it was known would obtain a majority in the Council of Elders, but would meet with a determined opposition in that of the Five Hundred.

On the 19th Brumaire (10th November) the councils assembled at St. Cloud. The republican minority in the Council of Elders complained loudly of the hasty and irre- parable consequences of the preceding proceedings, that the debate Bonaparte appeared at the bar, accompanied by Berthier and his secretary Bourrienne, the latter of whom gives an account of the scene. He told the deputies that they were treading upon holy ground, that he and his brethren in arms came to offer their services. He was disinterested, 'and yet,' he added, 'I am calumniated, I am compared to Cromwell, to Caesar.' This was uttered in a raubing, broken manner. Liget, one of the minor-

"General, will you swear to the constitution of the 19th Brumaire?" Bonaparte answered, "I will.

"The constitution!" he cried out, 'you violated it on the 18th Fructidor [AUGEREAU], you violated it on the 22nd Floréal, you violated it on the 30th Prairial. All parties by turns have appealed to the constitution, and all parties have been refused. The constitution is dead. End it. End it! we will make a new constitution, let us at least preserve liberty and equality.' He then talked of conspiracies, of danger to the Republic, &c. Several members insisted on the General revealing these conspiracies, explaining these dangers. Bonaparte, as usual, silent, explained nothing. Mounier and Barras, who had proposed to him to take the lead in the conspiracy, this increased the vociferations among the members: 'The General must explain himself, every thing must be told before all France.' But he had nothing to reveal. He only replied, 'My name is Mounier.' To a member of the convention, M. Mercoeur, he added: 'You who wanted to re-establish the convention and the reign of terror. His sentences became incoherent, he was confused, but at last he said, 'If any orator, paid by foreigners, attempts to put me out of the pale of the law, let him beware! I shall ascertain what to do. Several members crowded around him: entrance of this hall.' Bourrienne and Berthier advised him now to withdraw, and they came out together, when Bonaparte was received with acclamations by the military assembled before the palace.

The Council of Five Hundred had also assembled. Its president, Lucien Bonaparte, read aloud the resignation of Barras, which had been forwarded by the Council of Elders. Some of the leaders then proposed to repeat the oath of fidelity to the Constitution, which was carried by acclama-

"Nay, our Constitution!' cried out the deputy Augusteur, who was present, went out and told Bonaparte what was passing in the council. 'You have placed yourself in a pretty situation.'—'Augusteur, replied Bonaparte, 'remains; he was still worse at one time. Keep quiet, and in half an hour you will see.' He then entered the Council of the Five Hundred, accompanied by four grenadiers. The soldiers remained at the entrance, he advanced towards the middle of the hall, un- accompanied. "We will have no dictator, no soldiers in the san-

cuary of the laws. Let him be outlawed! he is a traitor!' Bonaparte attempted to speak, but his voice was drowned in the general clamour. He was confused, and seemed un-
certain what to do. Several members crowded around him: a cry of 'Let us save our General!' was heard coming from the door of the hall, and a party of grenadiers rushed in, placed Bonaparte in the midst of them, and brought him out of the hall. One of the grenadiers had his coat torn in the struggle, and the soldiers demanded his pay. The draw against Bonaparte appears to be unfounded. In the confusion of the moment Bonaparte may have fancied it. Lucien, after the departure of his brother, attempted to pacify the council, but the exasperation of the members was too much for him. When the news was brought to Bonaparte, Lucien refused to put it to the vote, saying, 'I cannot outlaw my own brother,' and he deposed the insignia of president, and left the chair. He then asked to be heard in his brother's defence, but he was not listened to. At this moment a party of grenadiers came around the hall. Lucien put himself in the midst of them, and they marched out. He found the military outside already exasperated at the treatment their general had re-

ceived. Lucien, on hearing all this, and finding the crowd cried out to them, that factious men, armed with daggers, and in the pay of England, had interrupted by violence the deliberations of the Council of Five Hundred, and that he, in his quality of president of that assembly, requested them to employ force against the instigators of the disturbances. That the assembly of the Five Hundred is dissol

This address of Lucien decided the business. The soldiers felt no more scruples in obeying the orders of the president. M. Murat entered the hall of the Council, at the head of a de-
gnate of grenadiers. The situation of the business was one of disorder. The deputies to disperse, but was answered by loud vociferations, exclamations, and shouts of 'The Republic for ever!' The drums were then ordered to be beat, and the soldiers to clear the hall. They levelled their muskets, and the grenadiers fired a few rounds. This was sufficient; the windows were jumped out of the windows, others went out quietly by the door. In a few minutes the hall was entirely cleared. In this affair the military were the instruments, and Lucien
The chief direction. It is well here to quote the words of Lucien, who after a lapse of thirty years, filled with strange vicissitudes, has lately reverted to this subject, in a pamphlet in answer to General Lamarque's "Memoirs." 'We were convinced that the immense majority of the French would approve our proceedings; but our audacity did not wish to place the nation at the disposal of the dukes of France, and for this we hesitated....' The pursuit of so many objects was for a moment confused, not as it has been absurdly asserted through weakness, but because he was going to usurp a right which he had not then,—the right of dissolving the legislature. Yet, in view of the scaffold and the stigma of traitors, which would have been our lot had we failed, without having time to take the votes of the nation upon our bold attempt. If Napoleon wavered a moment, he soon conquered his hesitations. And so it was with the senate. It was only a moment of indenmity by raising my brother to the consulate, and afterwards (unluckily perhaps) to the empire.' (Réponse de Lucien Bonaparte, Prince de Camino, aux Memoires du General Lamarque, London, 1835). And in another place he says, that 'the appeal of the councils to the constitution was an inconsistency, as that constitution had been already violated by themselves on the 18th Fructidor (1797). On that day the legality of the councils was lost; the invalidity of the Council of Five Hundred could only have consequences for the police. We must seek a solution to the constitution. Beyond this there is no more legality for any one of the branches of the legislature.' One might go further back than the 18th Fructidor, and question the legality of the 13th Vendémiaire, in which Bonaparte had sat to the consternation of the constitution. The result of the overthrow of the constitutional monarchy in 1792, would be merely a waste of time.

On the night of the same day (19th Brumaire) the elders assembled again, and agreed that a provisional executive of three consuls, in conjunction gave in the favour of the country, and the country, and the country, and the country. Lucien assembled a small minority, some say only thirty members, out of Five Hundred, who on that night passed several resolutions, by one of which it was stated that there was no longer a directorate, and that the constitution, such as the consuls had been drawn up, were declared to have forfeited their seats in consequence of their violence and their crimes. By another, three provisional consuls were appointed, Sieyes, Ducos, and Bonaparte. At one o'clock in the morning, Bonaparte took the oath before the council. At three o'clock the two councils adjourned for three months, after appointing a commission to revise the constitution.

Everything was then quiet at St. Cloud, and Bonaparte returned to Paris with Bourrienne. After quietly the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and the and France was still at war with Austria, England, and the Porte. Bonaparte sent Duroc on a mission to Berlin, by which he confirmed Prussia in its neutrality. The news of Paul of Russia had withdrawn from the conference after the battle of Zorich, 25th September, 1799, in which Massena gained a victory over the Russian army. Bonaparte now wrote a letter to the king of England, expressing a wish for peace between the two nations. Lord Stirling, secret agent of Britain, took the letter, but the French admiral had a prompt and a plain answer, expressing doubts as to the stability of the present government of France, an uncertainty which would affect the security of the negotiations; but disclaiming at the same time any claim to preserve the status quo, he added that in whose hands she shall vest the authority necessary for conducting the affairs of a great and powerful nation. His Majesty looks only to the security of his own dominions and those of his allies, and to the general safety of Europe. But in the event of a breach of the peace, he can in any manner be attained, His Majesty will eagerly embrace the opportunity to concert with his allies the means of immediate and general pacification. Unhappily no such security hitherto exists; no sufficient evidence of the principles by which the necessità were rectified, no reasonable grounds by which to judge of its stability. This correspondence was the subject of animated debates in the British parliament. (Parliamentary Register for the year 1800.)

Bonaparte made an overture in compliance with the general wish for peace, but he says himself that he was not sorry it was rejected, and that the answer from London filled him with secret satisfaction, as war was necessary to maintain energy and union in the state, which was ill ordered, ill governed, and ill supported by the confidence of the people. (Monttholon, Memoirs of Napoleon, vol. i., note on Pitt’s policy.) Bonaparte at the same time succeeded in putting an end to the civil war in La Vendée: he entered into negotiations with the principal Vendean chiefs, offering a complete amnesty to all who, before the sound of the trumpet, time to send troops to La Vendée to put down any further resistance. The royalist party had gained considerable strength; owing to the weak and immoral policy of the Directory, many officers of the republic, both civil and military, went over to the Vendée, and the government was on the point of confiding to Bonaparte, they preferred anything to anarchy, and the return of the reign of terror. But the temperate and yet firm policy of the first consul effected a great alteration in public opinion. They saw the perfidy and the meanness of the officers under government were filled with men from all parties, chosen for their fitness. ‘We are creating a new army,’ said Bonaparte; ‘of the past we must remember only the good, and forget the evil. Times, habits of business and experience, have formed many able men and modified many characters.’ Agreeably to this principle, Fouché was retained as minister of police. Berthier was made minister at war instead of Dubois Cramé, the minister of the Directory, who could give no returns of the different corps, and who answered all questions by saying—We must communicate with the army, not with the ministers, it resists and clothes itself by requisitions on the inhabitants.

The churches which had been closed by the Convention were re-opened, and Christian worship was allowed to be performed all over France. The Sabbath was again recognized by law as Sunday, and the computation by weeks resumed. The festival of the 21st January, being the anniversary of the death of Louis XVI., was discontinued. The oath of hatred to royalty was suppressed as useless, now that the republic was firmly established and acknowledged by all, and as being an obstacle to the good understanding between France and the other powers. At the same time the sentence of transportation passed on the 19th Brumaire, on fifty-nine members of the former Council of Five Hundred, was changed into their remaining a distance from Paris, under the surveil-lance of the police.
mida in font of Alessandria. On the 14th of June Mela
crossed the Bormida and three columns attacked the
French. The Austrians carried the village of Marengo,
and drove the French back upon that of San Giuliano,
which was attacked by a column of 5000 Hungarian
grenadiers. At four o'clock in the afternoon the battle
seemed lost. For a time, Joffre was not thinking on all points, and in
considerable disorder, and the Austrians, seeing a division
attacked the advancing column, while the younger
Kellerman with a body of heavy horse charged it in flank.
The column was broken, and General Zach, the Austrian
second in command, and his staff, were taken prisoners.
The commander, thinking the old French officers
exhausted with fatigue, and thinking the battle won,
had just left the field and returned to Alessandria.
The other French divisions now advanced in their turn, a panic
spread among the Austrians, who, after fighting hard all
day, had thought themselves sure of victory, and they fled
in confusion towards the Bormida, many being trampled
down by their own cavalry, which partook of the general
disorder. The Austrian official report stated their loss in
killed, wounded, and prisoners at 9069 men, and 1423
horses. The French stated their own loss at 4600 men
and that of the Austrians at 12,000. But the loss of
the French must have been greater. Desaix was
shot through the breast in the charge; he fell from his horse, and
telling those around him not to say anything to his men, he expired
in the arms of his faithful friend. An armistice was concluded on the 16th of June between
the two armies, by which Melas was allowed to withdraw
his troops to the line of Mantua and the Mincio, the French
keeping Lombardy as far as the river Oglio. Melas, on his side, could not keep Piedmont and the Genoese territory, with all
their fortresses, including Genoa and Alessandria, to the
French.
Bonaparte having established provisional governments at
Milan, Turin, and Genoa, returned to Paris, where he ar-
rived on 29th of July, and enthusiasm was revived with the
hope of the French.
The battle of Marengo had wonderfully con-
solidated his power, and increased his influence on the opinion
of the French. Negotiations for peace took place between
Austria and France; Austria however refused to treat without
England, and Bonaparte demanded an armistice as a
condition. A convention was signed at Milan.
Egypt were then on the point of surrendering to the Eng-
lish, and Bonaparte wished to send reinforcements to those
countries during the naval armistice. This was refused by
England, and hostilities were resumed by sea and by land.
Moreau defeated the Austrians commanded by Arch
duke John, in the great battle of Hohenlinden, and ad-
vanced towards Vienna. The French in Italy drove the
Austrians beyond the Adige and the Brenta. (For all this war of 1800 see Précis des Evenements Militaires, par Ma-
thiessen.)

Austria was now obliged to make a separate peace. The
treaty of Lunelwe, 9th February, 1801, arranged by the two
plenipotentiaries, Count Cobenzel and Joseph Bonaparte,
was mainly grounded on that of Campoformio. Austria re-
tained the Venetian territories, but Tuscany was taken away
from the Grand Duke Ferdinand, and bestowed upon Louis,
son of the Duke of Parma, who had married a princess of
Spain. Through the mediation of the Emperor Paul of
Russia, with whom Bonaparte was now on very friendly
terms, these years of occupation by France, the year before,
was acknowledged by Bonaparte, and left in full possession of his territories, except the legations which
had been annexed to the Cisalpine republic. In the course
of the same year negotiations were begun with England, where
Mr. Pitt had succeeded Mr. Pitt as prime
minister. Egypt and Malta having surrendered to the
English, the chief obstacles to peace were removed. The
preliminaries of peace were signed at Paris on the 10th of
October, 1801, and the definitive treaty was signed at
Amiens, 24th April, 1802. By this treaty France was
confirmed in the conquests of 1792, the
Malta should be restored to the Knights of St.
John, and the forts be occupied by a Neapolitan garrison.
The independence of the Cisalpine, Batavian, Helvetic, and
Ligurian republics was guaranteed. Egypt was restored to the suzerain, the Caliph of Great Hope to Holland, the
French West Indies, the Italian islands of Elba, and restored
the island of Ceylon.

Bonaparte had shown at this period an earnest desire for
peace, which France stood greatly in need of. Both royal-
ists and republicans were dissatisfied with his dictatorship.
Joseph Aenus, Corsican, and brother of Bonaparte, a
depand of the Council of Five Hundred, who had warmly opposed
Bonaparte on the 19th Brumaire, Cerecchi and Diana,
Italian refugees, and several other violent republicans,
formed a conspiracy against Bonaparte's life; but they
were discovered and imprisoned. Soon after a fresh con-
spiracy of the same nature was discovered. In a letter, sent to
the Directory, Count de la Ciotat, which was read out in
the Assembly, said that the execution of ten million
persons united, was near terminating the life of the first consul.
As Bonaparte was passing in his carriage through the Rue
Nicaise on his way to the Opera, 24th December, 1800, a
harmless explosion of several barrels of gunpowder in a
harness shop on one side of the road, destroyed several
houses and killed many persons. Bonaparte's carriage
had just passed, owing to the furious driving of the coachman,
who was half intoxicated, and who made his way through all
obstacles that had been purposely placed on the road.
The police, therefore, had only two or three royalists
connected with the Chouans in the west of France.
They were tried and executed. At the same time Arena and
his republican friends, who had been already found guilty,
although, it was said, upon evidence not quite conclusive,
were brought to their confirmation and executed. By a
Senatus Consultum, for such the decrees of the Senate were
styled, 130 known leaders of the old Jacobin party, several
of whom had participated in the atrocities of the reign of
terror, were ordered to be transported beyond the seas. Bu-
onaparte then limited the number of those banished to
Jacobs and Bourbonists. A law passed the legislative
body empowering the executive to banish from Paris, and
even from France, persons who should express opinions
inimical to the present government. By another law, which
was also passed, the ministers and officials were afterwards sanctioned by the legislative body, special crimi-
nal courts were established to try all persons accused of
treason against the state. The secret police was now or-
organised with the utmost skill by Fouche, and numerous
persecutions were made by them. As to the general police, there was a military police, and another
police establishment under Bonaparte himself, in his own
household.

In April, 1801, a general amnesty was granted to all
emigrants who chose to return to France and take the oath of
fidelity to the government within a certain period. From
this amnesty about 500 were excepted, including those who
had been at the head of armed bodies of royalists, those who
belonged to the household of the Bourbon princes, those
French officers who had been guilty of treason, and those
who had held rank in foreign armies against France. The
property of the returned emigrants which had not been
sold was restored to them. Another conciliatory measure
was the concordat concluded between Joseph Bonaparte
and Cardinal Consalvi, which was signed by Pius VII. in
November.

The popes, however, never regained the absolute
independence, if ever granted by his predecessors. He suppressed
many bishoprics, he sanctioned the sale of church property
which had taken place, he superseded all bishops who had
refused the oath to the republic, and he agreed that the
first consul should appoint the bishops, subject to the appro-
val of the pontiff, who was to bestow upon them the
canonical institution. The bishops, in concert with the
government, were to make a new distribution of the
parishes of their respective dioceses, and the incumbents appointed
by them were to be approved by both the authorities.
The bishops, as well as the incumbents, were to take the oath
of fidelity to the government, with the clause of revealing any
plots they might hear of against the state. With these con-
ditions it was proclaimed, on the part of the French govern-
ment, that no Catholic religion was to be of the majority of
Frenchmen; that its worship should be free, public,
and protected by the authorities, but under such regulations as
the civil power should think proper to prescribe for the sake
of public tranquillity; that its clergy should be provided
for by the state, and that its churches should be restored to them. The total abolition of convicts
was also confirmed. This concordat was not agreed to by
the pope without some scruples, nor without much opposi-
tion from several of the theologians and canonists of
the church. (Concerning Pius VII. see his Life, by
Milan, 1824; and also Botta, Storia d' Italia del 1789 al
1814.) On Easter Sunday, 1802, the concordat was pub-
lished at Paris, together with a decree of regulations upon
matters of discipline, which were so worded as to make

No. 288. [THE PENNY CYCLOPAEDIA.] VOL. V. S.
them appear part of the text of the original concordat. The regulations were that no bull, brief, or decision from Rome should be acknowledged in France without the previous approval of the government; no nuncio or apostolic commissioner to appear in France, and no council to be held without its permission. Owners of abuses against abuses and discipline to be laid before the council of state; professors of seminaries to subscribe to the four articles of the Gallican Church of 1828; no priest to be ordained unless he have been twenty-five years of age, and have an income of at least 300 francs. The concordat was revised and reenacted, and the bishops of France should exercise the episcopal authority after the demise of the bishop, and until the election of his successor, instead of vicars elected ad hoc by the respective chapters, as prescribed by the Council of Trent. This last article gave to the French church for life the supremacy of the jurisdiction of the church. The pope made remonstrances, to which Bonaparte turned a deaf ear. Regulations concerning the discipline of the Protestant churches in France were issued at the same time with those concerning the Catholic church. The Protestant ministers were also paid by the state.

On the occasion of the solemn promulgation of the concordat in the cathedral of Notre Dame the Archbishop of Aix officiated, and Bonaparte attended in full state. The old archbishop, De Thiers, who had been made a councilor in the morning to attend the levees of the first council, who took them unawares with him to Notre Dame. Bonaparte said at St. Helena that he never repented having signed the concordat: that it was a great political measure; that it gave France the honor of being the first country in the world, over a great part of the world, and especially over Italy, and that he might one day have endeavored by directing the pope's councils altogether. 'Had there been no pope,' he added, 'one ought to have been made for the occasion.' (Gourgaud's Memoirs, g.)

Bonaparte established an order of knighthood both for military men and civilians, which he called the Legion of Honour. This measure met with considerable opposition in the army, and the first council of one-third of the members of that body, the senate contrived to eject the most decided members of the opposition.

In January, 1812, Bonaparte convoked together at Lyons the members of the provisional government of the Cisalpine republic, together with deputations of the bishops of the courts of justice, of the universities and academies, of the several towns and departments, and the national guards, of the regular army, and of the chambers of commerce. The number of deputies amounted to about 500, out of whom a commission of 42 persons was selected, which was elected to the first council of France, the republic of the state of the Cisalpine republic. The report stated, that owing to the heterogeneous parts of which that republic was composed, there was a want of confidence among them; that the republic was in a state of infancy, which required for its administration a more elevated spirit of the citizens, and that it ended by requesting that the first council should assume the chief direction of its affairs. Bonaparte then repaired to the hall of the deputies, and delivered a speech which was an echo of the report: he agreed with all its conclusions, and confirmed it in more positive language. He told them that they should still be protected by the strong arm of the first nation in Europe, and that as he found no one among them who had sufficient claims to the chief magistracy, he was willing to assume the direction of affairs in the state of France for the time being, and by a vote of the representatives of the people and the state of the republic, and to retain it as long as circumstances should require it. The new constitution of the Italian republic was then proclaimed: three electoral colleges—1. Of proprietors; 2. Of the learned; 3. Of the merchants—represented the nation, and appointed the members of the legislature and the judges of the upper courts. The legislative body of seventy-five members voted without discussion on the projects of law presented to it by the executive. There were two councils, under the names of Consulta of State and Legislative Council, which contained the members of the government. The president, the treaties with foreign states, &c. The principal difference between this constitution and that of France was in the composition of the electoral colleges, they being selected in Italy by classes, and in France by communes and departments, without distinction of classes; and, also that in Italy there was no tribune to discuss the projects of law proposed by the executive. As to the rest, the election of members to the legislature in both countries was not made by the body of the people: in both, the executive power had the exclusive right of proposing the laws; in both the government was monarchical under republican forms, and the chief magistrate had an unlimited tenure. The government of the Italian republic was for ten years, and re-eligible. He appointed to all civil and military offices, transacted all diplomatic affairs, &c. Bonaparte appointed Melzi d'Eril as vice-president to reside at Milan in his absence. This choice was generally approved, as having a better claim to the title of a new constitution for the Ligurian or Genoese republic, similar to that of the Italian republic: he did not assume the chief magistracy himself, but placed a native doge at the head of the state. On the 2d August, 1802, Bonaparte was proclaimed consul for life. He was surrounded by the leaders of the republic by the votes of the people in the departments to the number of three millions and a half. A few days after, another Senatus Consultum appeared, altering the formation of the electoral bodies, reducing the tribunate to fifty members, and paving the way in the legislation to one power. The Mémoires sur le Consulat, by Thibaudeau, explain the intrigues that took place at the time.

Switzerland was at this time distracted by civil war. The French troops had evacuated the country after the peace of Pressburg, and the remains of the government could have no claim on the different cantons remained. Bonaparte called to Paris deputations from every part of Switzerland, and after listening to their various claims, he told them that he would mediate among them: he rejected the schemes of unity and uniformity, which the country had made in the past, and that the old cantons of the Alps, the cantons of the Helvetian league, the cantons of the Cisalpine republic, the cantons of the Helvetic league. He retained however according to localities. The general Diet of the cantons were re-established. The neutrality of Switzerland was recognized; no foreign troops were to touch its territory; but the Swiss were to maintain a body of 16,000 men in the service of France, as they formerly did under the old monarchy. Bonaparte remained the head of the Helvetic league. He retained however Geneva and the bishopric of Basle, which had been seized by the Directory, and he separated the Valais, which he afterwards aggregated to France. To the end of his reign Bonaparte reorganized the constitution of the Helvetic league, and by the act of mediation; that and little San Marino were the only Republics in Europe whose independence he maintained.

Bonaparte had directed a commission of lawyers of the first eminence under the presidency of Cambacères to prepare a civil code, such as the civilized nations of Europe frequently attended their meetings, and took great interest in the discussions. The result of their labours was the Civil Code, which has continued ever since to be the law of France. It was styled 'Code civil des Français,' and it was accompanied by a Code de procédure. A Code penal, accompanied likewise by a Code d'instruction criminelle, a commercial code [Azuni], and a military code, were afterwards compiled and promulgated under Bonaparte's administration. These several codes, which are very difficult to classify, exist in the same state, and designated by the name of Code Napoleon, will form the subject of a separate article. [Cons.] The Civil Code is considered by far the best, and constitutes perhaps the most useful bequest of Bonaparte's reign.

The various branches of public instruction also attracted Bonaparte's attention, though in very unequal proportions. The task of providing elementary education was thrown upon the communes, but the communes being mostly very poor, the establishment of primary schools met with many difficulties, and the primary education was left in a languishing and precarious state during the whole of Napoleon's reign. Several reports delivered by the councilors of state, Fourcroy, to the legislative body under the consulate and the empire, show the wretched state of primary and secondary instruction throughout France. The secondary instruction was chiefly given in private schools for famous. Fourcroy, stated
the number of pupils under ten years of age in the primary and secondary schools at only 75,000, and this in a population of thirty-two millions. Classical and literary instruction was afforded by the Lyceas to about 4000 pupils, whose expenses were defrayed by the State, besides boarders kept at the charge of their parents. The discipline of these estab-
ishments was rigorous. (Lait. c.) Military education and military manoeuvres were the chief objects of instruc-
tion at the Lyceas. Scientific education was given in the special schools in the chief towns of France, such as the schools of law and of medicine, the college of France, and the polytechnic school at Paris, the military school at Pon-
tainnebule, the school of artillery and engineers at Mainz, that of bridges and highways, or civil engineers, the schools for the mines, &c. Speculative, philosophical, or political studies met with little encouragement under Bonaparte's administration. The young men were more interested in politics and army, and censured them as an idle and dangerous occupation.

The provincial administration of France was now organ-
ized upon one uniform plan, and was made entirely de-
pendent on the central power or executive. Each depart-
ment had a prefect, who had the chief civil authority; he was generally a stranger to the department, received a large salary, and was removed or dismissed at the will of Bon-
parte. The mayors of the towns of 5000 inhabitants and upwards were appointed by Bonaparte; those of the com-
unes under 5000 inhabitants, as well as all the members of the municipal councils, were also appointed by the prefects. Thus all remains of municipal or communal liberty and popular election were quietly abrogated in France. 'I was a dictator,' says Napoleon, 'called to that office by the force of circumstances. It was necessary that the strings of the government, which extends all over the state, should be in harmony with the key-note which was to influence them. The organization which I had extended all over the empire required to be maintained with a high degree of pressure, and to possess a prodigious force of elas-
ticity. (Lait. c.) Not only was the power of the prefects greater than that of the kings of the old monarchy, as his prefects were not men distinguished by rank and fortune and connexions, as the former governors and lieutenant generals; they owed their whole power to their immediate command over the troops, and they had no personal influence on opinion, and no force except the impulse they received from the chief of the state.

After the peace with England, Bonaparte sent a fleet and an army under his brother-in-law, General Leclerc, to St. Domingo. After a severe and bloody war ensued, which was marked by atrocities on both sides, and ended in the destruction of the French force, and the total emancipation of the blacks. At the same time he re-established the slavery of the blacks in Guada-
ungo, and also of the children of those who had been freed. By a treaty with Spain, that country gave up Louisiana to France, which France afterwards sold to the United States for fifteen millions of dollars. By another treaty with Por-
tugal, France acquired Portuguese Guiana. In Italy, France took possession of the duchy of Parma, at the death of the duke Ferdinand, in October, 1802. She likewise took possession of the island of Elba, by an agreement with Naples and Tuscany. The annexation of Piedmont to France next filled up the measure of alarm of the other powers. The Duke of Berry took the opportunity of the French, and Bonaparte had given out hopes that he would restore it to the old king, for whom Paul of Russia evinced a personal interest. He was then still at war with England, and he had formed a scheme of an offensive alliance with Russia at the expense of Turkey, with a view to march a combined army to India. The violent death of Paul having put an end to this scheme, he immediately procured a decree of the senate constituting Piedmont into a military division of the French empire, under a council of adminis-
tration named in accordance with the model of the French Senate. The Duke of Berry was about to become king of Sardinia, but after the assumption of the presi-
dency of the Italian republic, and the annexation of Parma and Piacenza, he was succeeded by the old Duke of Berry, provisionally occupied by the French, and Bonaparte had given out hopes that he would restore it to the old king, for whom Paul of Russia evinced a personal interest. He was then still at war with England, and he had formed a scheme of an offensive alliance with Russia at the expense of Turkey, with a view to march a combined army to India. The violent death of Paul having put an end to this scheme, he immediately procured a decree of the senate constituting Piedmont into a military division of the French empire, under a council of adminis-

and of the duke's answers in Bourrienne's Mémoires, vol. v.)

The charges laid before the court against the prisoner were:
that he had borne arms against the French republic; that he had been tried and condemned to death by the Revolutionary Tribunal; that he was at the head of a party of emigrants assembled near the frontiers of France, and had treasonable correspondence with the neighbouring departments; and, lastly, that he was an accomplice in the conspiracy formed at Paris against the life of the king. This last charge the duke indignantly denied, and there is not the least evidence that he was implicated in it, nor that he had corresponded with either Pichegru or Georges. (Bourrienne.) He was however found guilty of all the charges. The duke expressed his desire to be tried on the first indictment. This however was overruled by Savary, who was present at the trial, though not one of the members, and who abruptly told the court that it was inexpedient to grant the prisoner's request. The duke was sentenced, by the same court, to death for crimes of espionage, of corsair, in alliance with the enemies of the republic, and of attempts against the safety, internal and external, of the state. (Jugement rendu par la Commission Militaire Spéciale scatée à Vincennes, 30 Ventôse, an XII. formée en vertu de l'arrêté du Gouvernement du 29 Ventôse, composée d'après la loi du 19 Fructidor, An V. de sept membres, nommés par le Général en Chef Murat, Gouverneur de Paris, à l'effet de juger le nommé Louis Antoine Henri de Bourbon, Duc d'Enghien, né à Chantilly le 2 août, 1772.)

Savary had orders from Bourrienne, that the trial should take place that same night, or rather early in the morning of the 21st March. The duke asked for a priest, which was refused; he then knelt down, and prayed for a minute or two, after which he was led down by torch-light to a postern gate of the gaol, as part of the gendarmes was drawn up, and a grave had been dug. It was dawn. Savary from the parapet gave the signal for firing. The duke fell dead, and was immediately buried in the dress he had on, without any funeral ceremony. (Savary's Mémoires, and General Hulin's pamphlet in extenuation of his share in the transaction.)

It is remarkable that Murat, afterwards king of Naples, when himself under sentence of death, told Captain Stratti, who guarded him, 'I took no part in the tragedy of the Duke of Enghien, and I cannot believe that God into whose presence I am soon to appear.' (Colletta, Storia del Reame di Napoli.)

In fact, Murat, as governor of Paris, merely appointed the members of the court martial according to the orders he received. It is not true that the duke wrote a letter to Bonaparte, which Murat delivered to the latter, as Murat himself seems to have believed. (Les Cases et Bourrienne.)

The apology which Bonaparte made at St. Helena for this judicial murder, was, that he believed the duke was privy to the conspiracy against his life, and that he was obliged to strike suddenly; and he would have ended the whole story by showing that he was not a man to be trifled with. An additional motive has been ascribed to him, namely, that of re-assuring the party implicated in the former French revolution against any fears they might have of his ever re-entering the Bourbons.

On the 6th April Pichegru was found dead in his prison. About the same time, Captain Wright of the English navy, who, having been employed in landing Pichegru and the other emigrants in Britain, was afterwards captured by the French, and imprisoned at Rochefort, was executed in the most shocking manner. The insinuation concerning the conspiracy, was likewise reported to have been found dead. The death of these two men is still involved in mystery. Bonaparte has positively denied any knowledge of Captain Wright's death, and has asserted his belief that Pichegru really strangled himself, as it was reported. Yet, even freely admitting the sincerity of his statements, one may suspect that the agents of his police, screened as they were from all public responsibility, might, in their eagerness to serve their master, or rather themselves, have resorted to some method. However, the case could not extract from them confessions that would suit their purpose. Bonaparte has repeatedly complained of the hasty zeal of some of his agents. It is stated by Bourrienne that Pichegru's depositions did not inculcate Moreau, whom the agents of the police sought to implicate. A number of dark rumours were circulated about Captain Wright having been put to excruciating torture. It is very possible that Bonaparte himself did not know at that time all the secrets of his prison-houses. There is a remarkable passage in Bourrienne, who, when he was French agent at Hamburg, kidnapped a spy, a really bad character, and sent him to Paris, where he wrote a letter by peremptory command of him. These are ominous words. See Montholon's Mémoires, vol. i., where Napoleon speaks of the arbitrary tyranny which the minister of police and his agents exercised until his decree on state prisons, 13th March, 1810, he changed the whole system. The French government, indeed, was not afraid of the tribunals; he had given them the liberty to hang any individual at their own pleasure and keeping him in their own hands, without the tribunals taking any cognizance of the case. This abuse had existed from the time of the convention.

The trial of Moreau, Georges, and the others, did not take place for several months after Pichegru's death. Mean-
Genoa, Durazzo, repaired to Milan with a deputation of senators, and expressed a wish on the part of the Genoese to make peace to the last. On the 9th of June Napoleon received Genoa. Soon after the Republic of Lucca was transformed into a principality, and given to Elisa, Napoleon’s sister, and her husband Baciocchi, to be held as a fief of the French empire. Thus two more Italian republics disappeared; San Marino alone remained.

In the preceding year (1804) Napoleon had assembled a large force on the shores of the British channel, with a flotilla at Boulogne, and had given it the name of ‘the army of England.’ The invasion of England and the plausible pretext of defending Boulogne through the lapse of time, seduced the suspicions of the British. After his return from Milan he gave a new impulse to the preparations for the projected invasion, and spoke of it publicly as an attempt resolved upon. His real intentions however have been a matter of much doubt and controversy. Bona parte, who was then still younger Bonaparte’s person, positively states that he did not entertain any serious view of landing in England; that he was duly aware of the difficulty and risk of such an undertaking; that even he had succeeded in landing 100,000 men, which was no easy matter, he might have lost one-half or two-thirds in taking possession of London; and then, had the English nation persevered, he, not having the superiority at sea, could not have obtained reinforcements, &c. Bonaparte, at St. Helena, spoke differently. He said he had spoken of it to Siborne, the Earl of Roden, and Sir Henry Erskine, and all over the sea; and while the English were sailing after them to different parts of the world, his ships were to return suddenly and at the same time; he would have had seventy or eighty French and Spanish ships in the channel, with a thousand sail of his fleet, to act as a diversion for two months. Three or four thousand boats and 100,000 men were ready at a signal. The enterprise was popular with the French, and was supported, Napoleon said, by the wishes of a great number of English. One pitched battle after landing, the result of which could not be doubtful, and in four days he would have been in London, as the nature of the country does not admit of a war of manoeuvres; his army should have preserved the strictest discipline, he would have presented himself to the English people with the magical words of liberty and equality, and as having come to restore to them their rights and liberties, &c. (Les Cases, vol. i. part ii.) It must be observed that all this declaration applies to his preparations towards the end of 1803 and the beginning of 1804, when he was still far from the discovery of the true character of the people. To O’Meara he spoke in a rather different strain. He said he would have gone straight to London, and have seized the capital, that he would have had all the mob for him, all the low, dissipated, and loose characters, all the restless discontented, who were always to be found in the same, fond of change, and riot, and revolution. He would have excited the democratic element against the aristocracy, he would have revolutionized England, &c. Whether, with such instruments let loose, he would have preserved the discipline of his army, and prevented the horrors that attended his invasion in Spain and other countries, he did not say. Luckily, however, for all parties, the trial was not made. While his army was assembled near Boulogne, a new storm burst on the side of Germany.

Austria had demonstrated against the never-ending encroachment of Napoleon in Italy. The Emperor of Russia and Gustavus, King of Sweden, protested against the violation of the German territory on the occasion of the seizure of the Duke of Enghien; the Moniteur answered them by taunts and ibes against the two sovereigns. By the treaty of Luneville the Italian, Batavian, and Ligurian republics were acknowledged as independent states, but Napoleon had now seized the crown of Italy, had annexed Liguria to France, and Holland as well as Hanover were occupied by his troops. Many of the French complaints remained unheeded. A new coalition was formed in the summer of 1805 between England, Russia, Austria, and Sweden. Prussia was urged to join it; she hesitated, increased her armies, but remained neutral, looking forward to the result of the operations. The arrival of the Russians, who were assembling on the frontiers of Galicia, enraged an army into the electorate of Bavaria; and on the elector refusing to join the coalition, they entered Münich. General Mack, who had given sufficient proofs of incapacity in the field while commanding the troops in Silesia, was placed at the head of the great Austrian army. The Archduke Charles commanded the Austrian forces on the side of Italy. Napoleon directed his army of England to march quickly to the Rhine; other troops from Holland, Hanover, and the Electorate of France, were ordered to march to the same quarter. He appointed Massena to command the army in Italy.

On the 23rd September, 1805, Bonaparte went in state to the senate, where he delivered a speech on the occasion of the war. As this is a fair specimen of his peculiar style of oratory, we shall quote some extracts. ‘The wishes of the eternal enemies of the continent,’ he said, ‘are at last fulfilled; war is begun in the middle of Germany. Austria and Russia have joined England, and our generation is plunged again into all the calamities of war. . . . The Austrian army has crossed the Inn; the elector of Bavaria has been driven away from his capital; all my hopes of the preservation of peace have vanished. In this instance the wickedness of the enemies of the continent has fully revealed itself. They feared the manifestation of my deep love for peace; they feared that Austria, at the sight of the precipice they have dug under her feet, might return to sentiments of justice and moderation, and that they have hurried her into war. I sigh in thinking of the blood that this will cost Europe, but the French name shall derive a fresh lustre from the cause. It is the voice not of the Emperor of the Germans, but at the voice of the whole French people, I assumed the imperial crown, I received of you and of all citizens a solemn engagement to preserve it pure and without stain. My people will rush to the standard of its emperor and of his army, which shall be yours from this moment, gentlemen of the Magistrates, soldiers, citizens, all are determined to keep our country free from the influence of England, who, if she should prevail, would grant us none but an ignominious peace, the principal conditions of which would be the burning of our fleets, the filling up of our harbours, and the annihilation of our industry. I have fulfilled all the promises which I made to the French people, who, in their turn have exceeded all their engagements towards me. In the present crisis, so important to their glory and mine, they will continue to deserve the Moniteur, of which I have repeatedly saluted them on the fields of battle.’

It was by constantly throwing all the blame of the war upon the English, by continually representing them as a sort of incarnation of the evil principle ever intent on the division of France, that Napoleon glorified himself and his people. It was in order to create this spirit of bitter and deep animosity against England which continued to exist long after his death. It is curious to read the general conclusion to the same day, that and the faced assertions and charges against England with which its columns are filled. (Recueil de décrets, ordonnances, traités de paix, manifestes, proclamations, discours, &c., de Napoleon Bonaparte et des membres du Gouvernement Français depuis le 18 brumaire an 8 [Novembre, 1799] jusqu’à l’année 1812 inclusivement, extraits du Moniteur, 4 vols. vro. 1813, a very useful book of reference.) In one instance the English were gravely accused of having thrown bales of infected cotton on the coast of France in 1804, in order to introduce the disease into France itself. The Moniteur (the official journal) added, ‘the English cannot conquer us by the sword, they assails us with the plague; and strange to say, this absurd story has been revived in the Memoirs of Marshal Ney,’ published at Paris in 1832.

Napoleon repaired to Mainz where he took the command of the grand army, a name which was afterwards always applied to the army while he commanded in person. He also began in this campaign to issue regular bulletins of the events of the war. Coloured as these documents generally are (Bouronne, in his account of the Egyptian war, shows the principle of them, but he does not state which of them constitute however a series of important historical papers.

We cannot enter into the details of the campaign of 1805, and we must refer our readers to the professional state-ments of military historians. It was, however, the achievement of Stutterheim’s Campaign of Austriàts; Rapp’s Memoirs, &c. Sufficient to say that General Mack allowed himself to be surrendered at Ulm, and then surrendered, on the 17th
of October, without fighting, with more than 20,000 men, all his staff, artillery, &c. The other Austrian divisions being sent to the back of the Austrians without the city, the French entered Vienna on the 13th of Nov. The Russian army had by this time assembled in Moravia, under the Emperor Alexander in person. Being joined by some Austrian divisions it amounted to about 80,000 men. Napoleon had therefore finally settled whether the French army the first or the second in Europe. The great battle of Austerlitz was fought on the 2nd of December, 1805. The two armies were nearly equal in number. The Russians, confident of success, extended their line too much. Bonaparte broke through it and separated their divisions, which, after a stout resistance, especially to the part of the Russian Guards, were routed in detail. The loss of the allies was tremendous; thousands were drowned in the frozen lakes in the rear of their position. The emperor of Austria had an interview with Napoleon the day after, and an armistice was concluded, by which the remaining Russian troops were allowed to retire to their own country. Peace between Austria and France was signed at Presburg on the 26th of December. Austria gave up the Venetian provinces and Dalmatia to the kingdom of Italy, Tyrol to the Elector of Bavaria, and other districts to the value of one hundred millions of francs. This war, which was to have checked the preponderance of Napoleon in Italy, left that country entirely at his disposal, and established his influence over a great part of Germany, where, having raised the duchy of Berg and the grand-duchy of Oldenburg to the rank of kings, he placed himself at the head of all the smaller states, which he formed into the confederation of the Rhine under his protection. The old German empire was thus dissolved. Soon after, the Emperor Francis formally renounced his title of emperor of Germany, and assumed the title of Francis I, emperor of Austria and of his other hereditary states.

It must be observed that the position of Napoleon after the battle of Austerlitz in the heart of Moravia, the winter having set in, and a fair part from the Austrians and from his reinforcements and supplies, the Russians, who were expecting reinforcements, in his front, Prussia wavering on his flank, Boehme untouched, the Archduke Charles and the Hungarian insurrection in his rear, was extremely critical. In contrast, this situation induced him to grant Austria better terms than what she appeared to have a right to, on a mere superficial view of the condition of the two powers. The Austrian empire was not overthrown because Vienna was in the power of the invaders, but, rather, because the conduct of the campaign was such as to make the Russians the victors. The consequence of the Prussian defeat was the destruction of the confederation of the Rhine and the annihilation of the old German empire.
BON

(28th of Dec.), in which the French experienced a severe check retired towards the Vistula. The French, on the 29th, 1807, passed without any engagements, but on the 8th of February the great battle of Eylau was fought between the two grand armies. General Bennigsen commanded the Russians. The French made repeated and furious attacks on the Russian infantry, which stood like walls of brass, and the French never lost sight of the enemy. The battle lasted till near ten o'clock at night. The loss on both sides was dreadful; it has never been correctly ascertained, but has been roughly estimated at 50,000 men. After the battle Napoleon withdrew again to the line of the Vistula, and his supreme council of war retired to Königsberg. There was much more fighting between the two armies for more than three months after. The French meantime besieged Danzig, which was defended by the Prussian General Kalkreut, and surrendered at the end of May, 1807. Napoleon has this year renewed his attempt, but has, as yet, made no further progress towards the Russians. On the 13th of June the battle of Friedland took place, in which, after an obstinate struggle, the Russians were at last worsted, and driven beyond the river Aller. They did not lose however either cannon or baggage, and they effected their retreat upon Tilsit near the Russian frontier. (Sir Robert Wilson's Sketch of the Campaign in Poland in 1806-7; and Geschichte der Feldzüge Napoleonos gegen Preussen und Russland in 1806-7; Leipzig, 1809.)

The French, at this period, wished for peace, an armistice was made, and a personal interview took place between the two emperors on a raft in the middle of the river Niemen on the 25th of June. The two sovereigns after this took up their residence in the town of Tilsit, where the treaty of peace was finally signed. The king of Prussia was restored to the loss of his former gains, and added, as far as the Elbe. The duchy of Warsaw was given to the elector of Saxony, who was made a king, and became the faithful ally of Napoleon. The principal Prussian fortresses and sea-port towns were to remain in the hands of the French; and all the provinces of the Holy Roman Empire, on the contrary, she obtained a part of Prussian Poland. But there were secret articles to the treaty, by which France allowed Russia to take Finland from Sweden, and Russia, on her part, promised to close her ports against British vessels. On the 15th of July Napoleon left Tilsit, set sail for Paris, where he received the usual tribute of service addresses and fulsome flattery. (See specimens of these addresses in the Moniteur.)

On the 19th August a Senator Consulta suppressed the Thun, not only in the national department of the body in France. It had been previously reduced to one-half of its original number. 'The Tribunal,' said Napoleon at St. Helena, 'was absolutely useless, while it cost nearly half a million; I therefore suppressed it. I was never myself in the Thun, for the violation of the law; but I was strong; I possessed the full confidence of the people, and I considered myself a reformer. I did every thing for the best. Had I been hypocritical I should have maintained the Tribunal, for who can doubt that it would have been adopted and sanctioned, when required, my views and intentions?' And speaking of the alleged servility of the Senate, he informs us that 'in almost every important measure many of the senators, before they gave their vote, came to communicate with him privately, and stated, sometimes very decidedly, their objections to the bill, either by his arguments, or by the necessity and urgency of affairs.' (Las Cases, vol. i.)

Necessity and the urgency of circumstances were mighty words with Napoleon; they generally concluded all his arguments on matters of morality and politics. Where there were not his own creating or seeking is a point which he seems not to have stopped to examine. Three committees of administration, of legislation, and of finances, taken from the legislative body, discussed the projects of law in lieu of the Tribunal, and the committees of the three sections, the local boards, the Thun; but the deputation of the insurgents, under the plea that he had not joined them in the war against Prussia, as well as the duke of Brunswick of his, on the ground that the duke had joined Prussia against him, Napoleon created out of these and other districts the king's representative, the Thun; and then attempted to substitute Jerome, who took up his residence at Casell. Soon after, the Prince Regent of Portugal having refused to enforce the decrees against England, Napoleon sent Junot with 30,000 men across Spain to take possession of Portugal. At the same time he published in the Moniteur that 'the House of Braganza had consented to the marriage of Don Jose Junot entered Lisbon without opposition, November 30th, 1807, the Prince Regent and his court having just before embarked for Brazil. In December of the same year, Napoleon having gone to Milan, sent for the queen of Saxony to join him, and after some time the queen was promised compensation in Portugal, which she never obtained. On the 17th December, 1807, Napoleon issued from Milan a decree by which all merchant vessels which should submit to the British orders in council were declared to be lawful prizes by the French. In the following year (1808) a number of American vessels were seized and confiscated in the French and Italian ports. The pope was next to feel Napoleon's displeasure. The French troops had for some time occupied Ancona and Civita Vecchia, in order to keep away the English and the Russians; but Napoleon now insisted on the pope declaring war against England. The pope answered that he was a sovereign of peace, and could not declare war against any Christian power. Napoleon said that as the successor of Charlemagne he was emperor of the west, the king of Italy, and Suzerain of the Pope, and therefore the pope should respect the holy see, and that the donation of Charlemagne had been made to defend the holy church against its enemies; that if the pope did not comply with his wishes, he, Napoleon, would take back Charlemagne's grant. We cannot go further into this subject, as it involves a most interesting controversy and controversy between Napoleon and the court of Rome, which were carried on for several years, and which form an interesting episode in the general history of those times. (Compendio Storico sul Pio VII, Milano, 1824, Bott, Serviti d'Italia, Coppi Annali d'Italia, and Memorie storiche del cardinale Antonio Pericoli, Cardinali 1639-1729, a cura di Giovanni Battista De Boni, Rovigo, 1867.) Napoleon annexed the Marches or Adriatic provinces of the Roman state to his kingdom of Italy. There were other points of dispute between the pope and Napoleon on matters concerning the Concordat with the kingdom of Sardinia. (See a note in letter 386, note 7, of the letter books of the convent of Beauharnois, to Pius VII, in the subject in the already quoted work, Amministrazione del Regno d'Italia.) About the same time (February, 1808) a French force under General Miotto entered Rome, occupied the Castle of St. Angelo, and began to do military duty in that city. In February, 1808, the general took the papal troops under his own command. The pope remained in his palace with the mere shadow of a civil power, which he had no means to enforce.

We now come to another and most important transaction, the invasion of Spain. At the time of the invasion, the populace was the humble and submissive ally of Napoleon; her navy, her army, her treasures were at her disposal. She was at war with Great Britain; she had allowed a free passage to the French troops through her territory to Portugal. Other French divisions had entered Spain as friends in the beginning of 1808, and seized by stragglers the forresses of St. Sebastian, Pamplona, and Barcelona. At the same time the internal administration of Spain was carried on in a most corrupt and profligate manner. Charles IV was the humble and submissive ally of Napoleon; he was at war with Great Britain; he had been exalted to a king; and Charles was induced to abdicate. Napoleon founded upon this a pretence for interference. He invaded father, mother, son, and favourite to Bayonne, where he himself repaired in April. Charles and his queen went readily; Ferdinand hesitated; but Napoleon sent Savary, who with many assurances of his master's honourable and friendly intentions, induced him to yield the crown from stage to stage until he was fairly in the Spanish territory. A scene of duplicity and dishonesty, of indecent and unnatural retributions now took place between Napoleon, the old king, the queen, and her son, which for moral turpitude has no parallel in history. (Don Pedro de Alcega, Alcega, vol. ii, p. 559. A History of the Peninsular War. London, 1842.) Napoleon had so completely changed the character of the king, stigmatized Ferdinand as a rebellious son, the queen joined in reviling and disgracing him at the expense of her own and her husband's honour,
and Ferdinand, overwhelmed by insults and threats, renounced his claim to the crown of Spain on the 8th May. (Concerning the real sentiments of Ferdinand expressed at the time of his departure, see Baudr. Mémoires anecdotiques sur l'intérieur du Palais.) Charles likewise resigned all his rights 'in favour of his friend and ally the emperor of the French.' Napoleon now issued a decree, appointing 'his dearly-beloved brother Joseph Napoleon, king of Naples and Sicily, king of Spain and the Indies.' By a subsequent decree, 15th July, he appointed his 'dearly-beloved cousin, Joseph Murat, grand duke of Berg, to the throne of Naples and Sicily, which remained vacant by the accession of Joseph Napoleon to the kingdom of Spain and the Indies.' In compensation for his various dominions are signed Napoleon, and countersigned by the minister secretary of state, Maret.

The memorable events which resulted from these nefarious transactions, the occupation of Madrid by Murat, the revolt and subsequent massacre of the people of that city on the 2nd of May, the insurrection which broke out simultaneously in all parts of the Peninsula against the invaders,—the heroic though often unfortunate resistance of the Spaniards,—the atrocities committed by the French troops, and the cruel retaliations by the Spanish guerrillas,—the long, murder war of seven years, from 1808 till 1814, in which the British army acted a conspicious part,—all these may be read in the numerous works written expressly on the subject of the Peninsular war. For the military transactions, see Naper, General Natasha Vacani, and the Annales of the Peninsular Campaigns, by Captain Hamilton. For the Spanish view of the subject, see Count Toreno, Historia del Levantamiento, Guerra, y Revolución de España, Madrid, 1833; and Canga Arguelles, Observaciones sobre Historias de Carlos y Napier. For a general, historical, and political view of Spain during that period, see Southey's History of the Peninsular War. But the work that perhaps gives the best insight into the feelings and conduct of the Spaniards in the various provinces throughout that memorable struggle is the Histoire de la Révolution d'Espagne, by Colonel Schepeler, a Prussian officer, who was himself in the Spanish service during the whole time.

During the seven years of the Peninsular war 600,000 Frenchmen died at different times by the two great roads of Bayonne and Perpignan. There returned into France at various times about 250,000. The other 350,000 did not return. Making full deduction for those who remained prisoners in the hands of the Spaniards and the number of deaths that occurred at the period of 1814, the number who perished during that war can not be estimated at less than 250,000, if it does not approach rather 300,000. (Schepeler and Foy.) The loss of the Spaniards, soldiers and peasants, who were destroyed in the Peninsula, is not capable of exact calculation, but it must have been greater than that of the French.

In the year 1808 Napoleon re-established titles of nobility in France. Lefèvre, who had taken Dunois the year before, was the first duke that he created. Many others, both military and civilians, received titles from towns in Italy and Germany, with an income charged upon the revenues or national domains of the conquered countries. Both the titles and the incomes attached to them were made hereditary.

In September, 1808, Napoleon repaired to Erfurt to hold conferences with the Emperor Alexander. The subject of these conferences remained a secret, but it would seem that the question of Turkey was agitated. Napoleon says that the principal obstacle to a partition of that country was Constantinople. It seems however that he consented to Russia encroaching on the frontier provinces of Turkey, as the Russian troops invaded Moldavia and Wallachia soon after the conference. On returning from Erfurt, Napoleon told his chief that the Emperor of Russia were irreconcilably united in a bond of alliance.

The English in the mean time had reconquered Portugal, and were advancing to the assistance of the Spaniards. King Joseph had been obliged to leave Madrid, and the French army had withdrawn behind the Ebro. Napoleon resolved to set out for Spain himself. On the 25th October he opened in person the session of the legislative body with one of his characteristic speeches:—'The hideous presence of the English leopards contaminates the continent of Spain and Portugal. I go to place myself at the head of my armies, to crown my brother at Madrid, and to plant the French flag upon the ramparts of Lisbon. Two days afterwards he set off for Spain.

On the 23rd November, 1808, Napoleon defeated the Spanish troops at Tudela, and on the 4th December Madrid capitulated. He told the Spanish delegation that their children would bless his memory. He then set off for Astorga, expecting to intercept Sir John Moore in his retreat. In this however he did not succeed, and leaving the task of pursuing the English to Soult and Ney, he suddenly quitted Astorga, and returned in great haste to France in January, 1809.

The next great event of this war was on the point of breaking out. This time Austria came single into the field. She had made astonishing exertions to recruit her armies to the number of nearly half a million of men. Austria had apparently no personal subject of complaint, but the Mannheim Convention, though signed by France in 1806, caused considerable dissatisfaction, but on the 26th of May, 1808, 4 vols. 8vo, Paris, 1824-26.) On the 12th May the French entered Vienna. The archduke now collected his army on the left bank of the Danube. Bonaparte crossed the river to attack him, and the great battle of Aspern took place, 21st May, 1809. The Archduke was defeated, but on the following day it was renewed with fury on both sides, when, in the midst of the action, Bonaparte was informed that the bridge in his rear, which communicated with the right bank of the Danube, had been carried off by a flood. He then ordered a retreat, and with the loss of the island of Lobau in the middle of the Danube. The loss of the French was very great: Marshal Lannes was among the generals killed. Napoleon remained for six weeks on the island. Having re-established the bridge, and received reinforcements, he crossed the Danube on the 14th June, and he fought the battle of Wagram, 6th July, in which he defeated the Austrians, with a tremendous loss on both sides. Still the Austrian army was not destroyed or dispersed, and the Archduke Charles was for continuing the struggle. Other battles were fought, and the campaign was prolonged to the 13th of October, when the armistice was concluded at Znain, and this led to the peace of Schönbrunn, which was not signed however till the 14th of October. Napoleon had entertained some idea of disemboweling the Austrian empire; he had even addressed an invitation to the Hanoverians to form and elect a federal, union, under a prince, but this address produced no effect. Germany began to be agitated by a spirit of popular resistance against him; bands of partizans under Schill, the Duke of Brunswick, and others, had appeared; Tyrol was still in arms, and he was not quite sure of Russia. The war in Spain continued with doubtful success, and the English had landed a considerable force at Flushing. He thought best therefore to grant peace to Austria on moderate conditions. The Archduke Charles disapproved of the peace, and gave a hostile reception to the Austrian statesmen. As a part of Croatia, Salzburg, Cracow, and Western Galicia, and several other districts, to the amount of about two millions and a half of inhabitants. The brave Tyrolese were abandoned to their fate. Hofer and others of their chiefs were seized by the French, taken to Munich, and there shot. (Life of Andreas Hofer, by Hall and Inglois's Tyrol.)

Whether the subsequent marriage of Napoleon with a daughter of the Emperor Francis was in course of negotiatiion, is a question of which the authenticity is doubted, but soon after his return to Paris he made known to his wife Josephine his determination to divorce her. A painful scene took place on this occasion, which is well described by De Bossuet, prefect of the imperial household, in his Mémoires, vol. ii., p. 12. Josephine is reported to have said that Napoleon himself seems to have been sincerely affected at Josephine's grief, but his notion of the necessity of having an heir to the empire subdued his feelings. It is known that from the time of the conferences of Erfurt, and perhaps of
Tilsit, he had had in view a marriage with one of Alexander's sisters, and the project had been communicated to the Russian court, but the empress-mother had always objected to it on the plea of difference of religion. The divorce being consented to by Josephine in presence of commissions from Napoleon, this document was registered in Paris on the 16th of December, 1809. On the 11th of March, 1810, Napoleon married by proxy the Archduchess Maria Louisa, who soon after set off for Paris. The marriage ceremony was performed at Paris by Cardinal Fesch. They were the couple of the greatest power. There is an interesting report made by Count Montalivet of the situation of the French empire in 1810, which displays the gigantic extent of its dominions. One passage which refers to Holland is curious. That country, it must be observed, felt really anxious for the welfare of his Dutch subjects, and did not enforce very strictly the continental system, as it was styled, against English trade. This led to frequent reproofs from his imperious brother, who at last resolved to enforce his prerogatives by uniting Holland to the French empire. (Louis Bonaparte's Historical Documents and Reflections on the Government of Holland.)

Count Montalivet in his report made use of a curious argument to prepare the people's minds for this measure:—'Holland is an island situated in latitude a little superior to that of Sicily; it may be defined as being formed out of the alluvia of the Rhine, the Meuse, and the Scheldt, which are the great arteries of the empire.' And Champaigny, minister for foreign affairs, in a report to the emperor said:—'Holland is an emanation of the French empire. In order to possess the rest of the world, you have to possess that country.' But even the Zuyderzee was not far enough. By a Senatus Consultum, 13th December, 1810, Holland, Friesland, Oldenburg, Bremen, and the line of coast to Hamburg, and the country between that town and Lubeck, were joined to the French empire, and the territory formed ten additional departments. The French empire now extended from the frontiers of Denmark to those of France, for Napoleon had finally annexed Rome and the southern papal provinces to France. The pope lauded French communication against Napoleon, upon which he was arrested in his palace on the Quirinal in the middle of the night of the 5th July, 1809, by a party of gendarmes who escaladed the walls, and was carried off to Savona, where he was kept prisoner until he was removed to Fontainebleau. (For an account of these proceedings see Memorie del Cardinal Pacco, with the Relation de l'Entente du Pape Pie VII. et de son Voyage jusqu'à Florence, par le Baron Radet, in the Appendix.)

Radet was the colonel of gendarmes who seized the person of the pope. The next day the Pope, by a decree of the French empire, called of Rome and of the Tyrrhenian, of which last Perugia was the head town. Napoleon gave his 'good city of Rome' the rank of second town in the French empire.

Besides the French empire, which, thus extended, reckoned 130 departments and 42 millions of people, Napoleon held under his sway the kingdom of Italy, which included Lombardy and Venice, Modena, Bologna, and the other legations and the marches, with above six millions of inhabitants; and to the French empire, excluding Dalmatia, Carniola, and part of Croatia, which formed a separate government. The kingdom of Naples, with about five millions more, was also dependent on his will, as well as the kingdom of Westphalia, the grand duchy of Berg, &c. The policy of the kingdom of Italy was also to be directed by his brother Lucien, and to the other relations was plainly stated by himself to his brother Lucien, in an interview at Mantua in 1811. 'In the interior, as well as the exterior, all my relations must follow my orders: every thing must be subordinated to the French empire; every thing must be in your respective states for the advantage and support of my crown. I should otherwise act against my duty and my interest. No doubt you would like to act the part of a Medici at Florence' (there had been some talk about this), 'but the moment you undertake to do so, it is clear that 'Tuscany, happy and tranquil, would become an object of envy to the French.' He would not allow his brothers to identify themselves with their subjects, and to strengthen themselves on their thrones, because he foresaw that it might suit him some day to remove them on the occasion of a general peace, or upon some new scheme of his own. He sacrificed the people of those countries and their interests, as well as the happiness and the greatness of his brothers, to what he conceived to be the interest and the glory of France. (Résponses de Lucien Bonaparte aux Mémoires de Lamarque.) But even his brothers were restive. They had written to him that he should not annex Holland; Murat was in continual disputes with his brothers-in-law (Colletta, Storia dei Reame di Napoli), and Lucien would not accept any crown under such conditions.

As Protector of the Confederation of the Rhine, Napoleon dealt under his brother Joseph, and held the grand duchy of Baden, Württemberg, the Grand Duke of Baden, and the other German princes. He had also under his protection the Helvetic Confederation, which was bound to furnish him with troops, and to follow his policy. Prussia, humbled and discouraged, had no power to resist his will. He could thus dispose of more than eighty millions of people. Never since the fall of the Roman empire, had so great a part of Europe been subject to the will of one man. Austria was his ally through fear as well as by family connexion; Russia through prudence and self-interest. In Sweden, General Bernadotte had been chosen Crown Prince, and, after obtaining Napoleon's consent, had repaired to Stockholm. Spain, bleeding at every pore, struggled hard, and apparently with little hope of ultimate success. Britain alone continued to defy his power, and held Sicily and Portugal under her protection, till March of that year, when Britain and Sovereignty and of Spain at the beginning of 1811. In the month of March of that year Marie Louisa was delivered of a son, who was saluted by Napoleon as 'King of Rome,' an ominous title to those Italians who still fancied that the crown of Italy was to be, according to Napoleon's promise, separated from that of France.

In 1811 the first symptoms of coolness between Alexander and Napoleon manifested themselves. The complaints of the Russian landholders against the continental system, which their emperor had sanctioned, were a fore- foreboding of their vast estates, had induced Alexander to issue an ukase, 31st December, 1810, by which colonial and other goods were allowed to be imported into the ports of Russia, unless they appeared to belong to subjects of Great Britain. At last relieved by that communication against Napoleon, upon which he was arrested in his palace on the Quirinal in the middle of the night of the 5th July, 1809, by a party of gendarmes who escaladed the walls, and was carried off to Savona, where he was kept prisoner until he was removed to Fontainebleau. (For an account of these proceedings see Memorie del Cardinal Pacco, with the Relation de l'Entente du Pape Pie VII. et de son Voyage jusqu'à Florence, par le Baron Radet, in the Appendix.) Radet was the colonel of gendarmes who seized the person of the pope. The next day the Pope, by a decree of the French empire, called of Rome and of the Tyrrhenian, of which last Perugia was the head town. Napoleon gave his 'good city of Rome' the rank of second town in the French empire.

Besides the French empire, which, thus extended, reckoned 130 departments and 42 millions of people, Napoleon held under his sway the kingdom of Italy, which included Lombardy and Venice, Modena, Bologna, and the other legations and the marches, with above six millions of inhabitants; and to the French empire, excluding Dalmatia, Carniola, and part of Croatia, which formed a separate government. The kingdom of Naples, with about five millions more, was also dependent on his will, as well as the kingdom of Westphalia, the grand duchy of Berg, &c. The policy of the kingdom of Italy was also to be directed by his brother Lucien, and to the other relations was plainly stated by himself to his brother Lucien, in an interview at Mantua in 1811. 'In the interior, as well as the exterior, all my relations must follow my orders: every thing must be subordinated to the French empire; every thing must be in your respective states for the advantage and support of my crown. I should otherwise act against my duty and my interest. No doubt you would like to act the part of a Medici at Florence' (there had been some talk about this), 'but the moment you undertake to do so, it is clear that 'Tuscany, happy and tranquil, would become an object of envy to the French.' He would not allow his brothers to identify themselves with their subjects, and to strengthen themselves on their thrones, because he foresaw that it might suit him some day to remove them on the occasion of a general peace, or upon some new scheme of his own. He sacrificed the people of those countries and their interests, as well as the happiness and the greatness of his brothers, to what he conceived to be the interest and the glory of France. (Résponses de Lucien Bonaparte aux Mémoires de Lamarque.) But even his brothers were restive. They had written to him that he should not annex Holland; Murat was in continual disputes with his brothers-in-law (Colletta, Storia dei Reame di Napoli), and Lucien would not accept any crown under such conditions.

As Protector of the Confederation of the Rhine, Napoleon dealt under his brother Joseph, and held the grand duchy of Baden, Württemberg, the Grand Duke of Baden, and the other German princes. He had also under his protection the Helvetic Confederation, which was bound to furnish him with troops, and to follow his policy. Prussia, humbled and discouraged, had no power to resist his will. He could thus dispose of more than eighty millions of people. Never since the fall of the Roman empire, had so great a part of Europe been subject to the will of one man. Austria was his ally through fear as well as by family connexion; Russia through prudence and self-interest. In Sweden, General Bernadotte had been chosen Crown Prince, and, after obtaining Napoleon's consent, had repaired to Stockholm. Britain alone continued to defy his power, and held Sicily and Portugal under her protection, till March of that year, when Britain and Sovereignty and of Spain at the beginning of 1811. In the month of March of that year Marie Louisa was delivered of a son, who was saluted by Napoleon as 'King of Rome,' an ominous title to those Italians who still fancied that the crown of Italy was to be, according to Napoleon's promise, separated from that of France.

In 1811 the first symptoms of coolness between Alexander and Napoleon manifested themselves. The complaints of the Russian landholders against the continental system, which their emperor had sanctioned, were a fore-
The capital of the world. There must be all over Europe but one code, one count of appeal, one currency, one system of weights and measures. Am I to blame if the great power will try to force these measures upon me? I desire to be master of the world; but when I become such, my son will have nothing to do but to retain my place. In calmer times, and after the full experience of disappointment, we find him confirming the sentiments he had expressed on the former occasion and many others. After his return from Elba, he said to Benjamin Constant, 'I desired the empire of the world, and who in my situation would not? The world invited me to govern it; sovereigns and subjects vied with each other in biding before my sceptre. I have rarely found any opposition in France. And later at St. Helena, 'If I have been on the point of accomplishing the universal monarchy, it was without any original design, and because I was led to it step by step. The last effort wanting to arrive at it seemed trifling, was it unreasonable to attempt it? But I had no ambition distinct from that of France, her glory, her ascendancy, her majesty, with which my own were identified. Had I lived in America, I should willingly have been a Washington; but had Washington been in France, exposed to_dissent within and attack from without, I should have been the hero of America.' (Las Cases, vol. i.) 'I have been spoiled by success. I have always been in supreme command; from my first entrance into life I have enjoyed high power; and circumstances, and my own energy of character, have been such that I have had the opportunity of exercising that authority, I acknowledged neither masters nor laws. (Las Cases, vol. iv., part iv.).

The events of the memorable Russian campaign of 1812 are known to the world. We can only refer our readers to the works of Segur, and of Colonel Boutinon, aide-de-camp to the Emperor Alexander; to the memoirs of Goggin; and to the Italian account of Captain Laugier, Of Italian in Russia. By consulting these various authorities, a sum of very correct information concerning that stupendous catastrophe may be derived.

Before Napoleon set off from Paris for the Russian expedition, he directed Maret, Duke of Bassano, to write a letter to Lord Castlereagh proposing negotiations for peace, on the basis of the Act Positivus. He was willing this time to let Spain, Portugal, and the two Sicilies remain independent, and to impose a heavy indemnity on the House of Braganza, but he insisted on Spain being secured to his brother Joseph. It must be observed that Lord Wellington had just taken possession of Badajoz and Ciudad Rodrigo, and was advancing into Spain towards Madrid, which was then held by the combined forces of the Spanish and the French at Salamanca. The English minister immediately replied, that England's engagements with the Spanish Cortes, acting in the name of King Ferdinand VII., rendered the acknowledgment of Joseph impossible.

The Russian minister, Prince Kourakin, still remained at Paris. Early in May he presented an official note to the Duke of Bassano, stating that the matters in dispute between the two empires might easily be made the subject of amicable negotiations, provided the French troops should evacuate the territory of both. A Dutch expedition against Russia could be for no other purpose than that of threatening the frontiers of Russia. Napoleon pretended to be exceedingly angry at this demand, which he said was insolent, adding that he was not used to be addressed in such a style, and to have his movements dictated by a foreign sovereign; and he sent Prince Kourakin his passports. On the 9th of May he himself set off with his army for Dresden, where he had invited the kings of his own creation, Bavaria, Württemberg, Saxony, Westphalia, and his other tributaries, to meet him; and his own troops, except those on his three sides, to Dresden with his emperor. The king of Prussia came too, as he had just signed a treaty with Napoleon, by which he placed 20,000 men at his disposal in the approaching campaign. Austria agreed to furnish 30,000 men to set against Russian Poland. But Napoleon, on his departure from Dresden, where the emperor Alexander then was, to invite him to come to Dresden, but Alexander declined. After brilliant festivals, Napoleon quitted Dresden for Thorn, where he arrived on the 2nd of June. His immense army was assembled chiefly between the Vistula and the Niemen, which latter river formed the boundary of the Russian empire. There were 270,000 French, 80,000 Russians, 80,000 Poles under Prince Poniatowski, 20,000 Italians under Eugene, and 20,000 Prussians. On the 22nd of June Napoleon issued a proclamation to his soldiers, saying that the second war of Poland had begun. The fate of Russia must be fulfilled. Let us be a Hannibal and make a breach, lay our hands on our own territory, &c. On the 24th and 25th of June Napoleon's army, in three large masses, crossed the Niemen, and entered Lithuania without meeting with any opposition. The Russian army, under General Barclay de Tolly, 120,000 strong, evacuated Wilna, which Napoleon, in the confidence of his strength, had retired to for the winter quarters of the army. Another Russian army, 80,000 strong, under Prince Bagration, was stationed near the Dnieper. On the 28th of June Napoleon entered Wilna, where he remained till the 16th of July. He there received a deputation from the diet of the duchy of Warsaw, warning him to proclaim the union of Russia and Poland. Napoleon's answer was still cold and cautious: he told them that he had guaranteed to the emperor of Austria the part of Poland he still retained; that for the rest they must depend chiefly on their own efforts. (De Pradt, Ambassade de Pologne.)

In the meantime, the French soldiers treated Lithuania as an enemy's country. The provisions ordered by Napoleon to follow his army not having arrived, and the Russians having removed all the stores, the French and German soldiers were driven to feed upon the horses of the nobility and the huts of the peasants, feeding their horses on the green corn, violating the women, and killing those who resisted such treatment. (Ougiinski and Segur.) Lithuania, a poor and thinly-inhabited country, in the latter part of the year (1811), was utterly devastated. At the same time, disorganization and demoralization spread fearfully through the enormous masses of the invaders; disease thinned their ranks; 25,000 patients were crowded within Wilna in a few weeks, where there was not accommodation for one-third of the number; heavy rains rendered the roads impassable, and 10,000 horses were lost.

After partial engagements at Mohlow and Witepsk, the Russians continued their retreat upon Smolensk, in the interest of fairs and pacific policy. On the 12th of June, 'Forward marchs alone,' he observed, 'can keep such a vast army in its present condition together; to halt or retire would be the signal of dissolution. It is an army of attack, not of defence; an army of operation, not of position. We must march, we must march, if we wish to obtain peace, or resting quarters and supplies.' (Segur.) He crossed the Dnieper, and entered Russia Proper with about 150,000 men, leaving a body of reserve at Wilna and the corps of Macdonald on the Dwina, towards Riga. In the march, the French army had dropped off from his ranks, and were either dead or sick, or had been taken prisoners by the Cossacks, or were straggling and marauding about the country.

On the 16th of August the two hostile armies met under the walls of Smolensk. But the Russians, after carrying off or destroying the provisions, and allowing time to the inhabitants to remove themselves, evacuated Smolensk, which their rearguard set on fire. They continued their retreat upon Moscow, and Napoleon followed them. The French army report was 250,000 men, and the river Moskva, fought on the 7th September. The two armies were nearly equal in numbers, 120,000 each. After a dreadful slaughter on both sides, the Russian general sounded a retreat, and the French were left in possession of the bloody field; but the French took hardly any prisoners - 15,000 Russians, and about 10,000 Frenchmen lay dead. Next day the Russian army continued its retreat; and on the 14th September it traversed the city of Moscow, which most of the inhabitants had already evacuated. On that same day the fire broke out in the coopers' street, and it was put down in the night. On the next day, 15th, Napoleon took up his quarters at the examining college, or in the ancient palace of the Tsars. On the following night the fire broke out again in different quarters of the city, and no exertions of the French could stop it: the wind spread the flames all over the city, and on the third day Napoleon was obliged to leave the Kremlin.
inn, where he stood in imminent danger. The fire raged till the 19th, when it abated, after destroying 7682 houses, about four-fifths of the town. This burning of Moscow has been attributed to a premeditated plan of the Russians; but Count Rostopchin, the governor, has denied this positively. "I am an individual," he says, "set fire to their own houses, rather than see them fall into the hands of the French soldiers seeking for plunder, or for wine and spirits in the cellars, where they got intoxicated, did the rest." (La Périn sur l’Incendie de Moscou, par le Comte Rostopchin, Paris, 1839.)

The marauders of Moscow used to be supplied, not from the immediate neighbourhood, but from a considerable distance in the interior, and especially from the southern districts towards Kaluga, where the Russian army was now posted. The French therefore could get no provisions, and they were only able to support their men chiefly on the flesh of their horses, which was salted down.

Napoleon remained among the ruins of Moscow for five weeks. He had sent Lauriston to the Russian head-quarters with a letter for the Emperor Alexander; the letter was forwarded to Petersburg, but no answer was returned. Napoleon was deceived in his calculations upon the temper of Alexander, and of the Russian people. At last, on the 19th October, seeing no chance of making peace, Napoleon began his retreat. The weather was fine and moderately cold; he was resolved to retreat before it was too late, when he expected to find provisions, but the stout resistance he met at Malo Yaroslavets induced him reluctantly to turn again to the road by Vareia and Viazma to Smolensk, by which he had advanced. He was closely followed by the Russian army; he was pursued not only by the Cossacks under the Hetman Platoff. His rear divisions had sharp engagements at Viazma and at the passage of the Wop. (Of Itallian in Russia.) His army dwindled away space, through fatigue, privations, and the constant attacks of the enemy. He had lost 20,000 horses, but was now reduced to one-half that number of fighting men: the rest formed a confused and disorderly mass in the rear, with an immense train of baggage and artillery. In this condition they were overtaken on the 6th November by the Russian army, which had arrived in time to prevent the greater part of the Cossacks under the Hetman Platoff. His rear divisions had sharp engagements at Viazma and at the passage of the Wop. (Of Itallian in Russia.)

This series of battles were fought about Dresden on the 24th, 25th, and 27th August between the Austrians and Russians on one side and the French on the other, in which the latter had the advantage. But in pursuing the allies into Bohemia, Vandamme, with a corps of 30,000, crossed the Jizera, and surrounded the Russian army. After much fighting, he had no longer an army. At Smorgoni, where he arrived on the 5th December, he took leave of his generals, left the command of the army, such as it was, to Mura, and set off in a sledge with Count Cami- laucourt to return to Paris. He arrived at Warsaw on the 18th December, and proceeded with some officers to De Pradt, where the latter has so humorously related. Continuing his route, he passed through Dresden on the 14th, and arrived at Paris on the 15th December at night. The remains of his unfortunate army were collected at Msz, on the line of the Vistula. On the 14th December, Berthier, dated 16th December, gives a dismal picture of the state of the troops after Napoleon left them:—"The plunder, insubordination, and disorganization have reached the highest pitch." The loss of the French and their auxiliaries in this campaign is reckoned by Boussuignat at 125,000 slain, 120,000 dead of fatigue, hunger, disease, and cold, and 133,000 prisoners, including 3000 officers and 49 generals. The "St. Petersburg Gazette" stated that the bodies burnt in the spring after the thaw, in Russia Proper and Lithuania, amounted to 308,000, of which course a considerable proportion were Russians. In the Berezina the French lost 7000 men, and in the ravines north of Warsaw about 9000, according to the Romanov, said to have been found. The French left behind 900 pieces of cannon and 25,000 wagons, caissons, &c.

Napoleon, after his return to Paris, exerted himself to recruit his army by fresh conscriptions, by drafting the national guards into his skeleton battalions, by recalling all the men he could spare from Spain, and by sending the sailors of his fleet to serve on land. He thus collected again in Germany, in the spring of 1813, an army of 350,000 men. The King of Prussia had now allied himself to Alexander, and his army of 300,000 men was neutralized; the Allies remained neutral; she offered her mediation, but Napoleon would hear of no cession on his part, in either Germany, Italy, or Spain. He soon after repaired to Germany, where he fought and won the battle of Lotzen, 2nd May, 1813, from the Russians and Prussians united. On the 21st he attacked them again at Bautzen, and obliged them to retire. But these victories led to no decisive results; the Allies retired in good order, and lost few prisoners and no guns, Bonaparte bitterly complained of this, and his generals—obliged to follow the Allies, could not prevent the French from losing Marengo, Austrolitz, Jena, when one battle decided the fate of the war. On the 22nd May, in another engagement with the retreating Allies, Duroc, his old and most faithful companion, who was one of the few personally attached to Napoleon, was killed. The dying man was taken to the house of a clergyman near the spot. Napoleon went to see him and was deeply affected. It was the only instance in which he refused to attend to the military reports which were brought to him. 'Every thing is far better,' he said, 'answer to his aides-de-camp.' He had a few days before lost another of his old brother-officers, Bessieres.

An armistice was now agreed to on the 4th June, and Bonaparte returned to Dresden, where Metternich came to him fresh on the 5th. The Allies, led by Austria, Austria proposed, as a principal condition, that Germany should be evacuating the French arms, and the boundaries of the French empire should be fixed at the Rhine, as Napoleon himself had repeatedly declared. But Napoleon would not hear of giving up the new acquisitions, nor was he anxious as far as Hamburg and Lubeck, nor would he resign the Protectorate of Germany. This led to a warm discussion, in which Napoleon said he only wished Austria to remain neutral while he fought the Russians and Prussians, and he would divide the spoils after the war was over; he was not afraid of the price of her neutrality. Metternich replied that things would go to that pass that Austria could no longer remain neutral; she must be either with France or against France; that Germany had been long enough tormented by these wars, and it was not to he left to the Canadians and Americans to national independence. The conferences however were carried on at Prague, without coming to any agreement; and in the midst of this the armistice expired 19th August, and Austria joined the allies. The
great superiority in numbers, and the French were driven close upon the ramparts of the town. The 17th passed without fighting; on the 18th the battle was renewed, the French divisions lost ground, and a body of 10,000 Saxons left them and went over to the enemy. Napoleon now marched to Geneva from the north-east, crossed the Rhine, and joined the 19th, the allies forced their way into the town after a desperate resistance, and the bridge being blown up, 25,000 Frenchmen were obliged to surrender prisoners. The retreat from Leipzig was nearly as disastrous to Napoleon as that from Moscow. His army was completely disorganized. He was, however, able to fight his way to Hanau, 30th October, through the Bavarians, his late allies, who now deserted him. He crossed the Rhine, and, passing over the 70,000 or 80,000 men, all that remained out of an army of 350,000, with which he had begun the campaign, he placed them on the left bank while he set off for Paris, where he arrived on the 9th November. (For the particulars of this hard-contested campaign of 1813, see Oebelein's narrative.) About 80,000 men left in the Prussian garrisons Magdeburg, Danzig, Stettin, &c. surrendered to the allies.

The enormous losses and reverses of the French armies, and the approach of the allies to the frontiers of France, produced a strong feeling of dissatisfaction in that country. The legislative body showed for the first time a spirit of opposition to the headlong system of Napoleon. A committee was appointed to draw up a report on the state of the country, which, maine, fisher, who had a character for independence, were of the committee. The report which they laid before the legislative body 28th December, 1813, expressed a desire for peace consistent with the honour and the welfare of France, and in a very moderate form expressed the sentiments of the nation. It was so desirable an object, and it ended by saying that 'while the government will take the most effective measures for the safety of the country, his Majesty should be entreated to maintain and enforce the entire and constant execution of the law, and to the French citizens the rights of liberty, property, and security, and to the nation the free exercise of its political rights.' The legislative body by a large majority ordered the report to be printed. This was a language which Napoleon had not been used to. He immediately ordered the doors of the hall of the legislative body to be closed and guarded by soldiers, and the copies of the report to be seized at the printer's. On the 31st an imperial decree adjourned the legislative body. On the 1st of January, 1814, several members of the legislative body having written to the emperor, he granted them an audience in a violent and coarse address, told them that they were not the representatives of the nation, but only the representatives of the individual departments; that he was the only representative of the people; that their report and the addenda which they had not had time to consider, were not not publicly to have commented on his conduct; and he ended by saying—'France stands more in need of me than I stand in need of France.' The senate, more subservient, had already passed a decree for a new constitution of 300,000 men, including all those who had escaped the conscriptions of former years. The taxes were at the same time ordered to be doubled; but the people were weary of these never-ending sacrifices, and in many departments it was found difficult to collect either men or money. Napoleon was driven to rock the nation to the bottom, to go more to no more than from 70,000 to 80,000 men. He had to contend with twice that number, besides numerous reinforcements which were hastening through Germany. Peace conferences were held at Châtillon, in which the allies proposed to fix the limits of France as they were in 1792, that is to say, with the exclusion of Belgium; but Napoleon would not listen to this. It was his last chance of peace. At the end of January, 1814, Napoleon began the campaign, which has been considered by tacticians as that in which he must be regarded as the victor. In his army he formed four fortifica-
tory combinations, fertility of resources, and quickness of movements. For more than two months he held at bay the various armies of the allies, now beating one corps and then flying to attack another; his troops, however, gave him his success. (See Mémories de la Campagne de 1814.) But the odds were too many against him. While he by a bold movement placed himself in the rear of the allies, the latter marched upon Paris, and after a hard-fought battle, 30th March, took possession of the whole line of defence which protected that city. He then left the town, and joined Blücher and Joseph Bonaparte, after the battle of the 30th, quitted Paris also. Marshal Marmont asked for an armistice, and this led to the capitulation of Paris, which the emperor Alexander and the king of Prussia entered on the 31st, amidst the loud acclamations of the people. He declared that they would no longer treat with him. Meanwhile a decree of the senate declared that Napoleon Bonaparte, in consequence of sundry arbitrary acts and violations of the constitution (which were specified and classed under various heads in the preamble to the decree), and by his refusing to treat with the allies upon honourable conditions, had forfeited the throne and the right of inheritance established in his family, and that the people and the army of France were freed from their oath of allegiance to him. A provisional government, consisting of Talleyrand, Bourbonville, Delberg, and others. Upon this, Bonaparte, after much reluctance, and upon his generals refusing to join him in a last desperate attempt upon Paris, which he mediated, signed the act of abdication of the 20th April, 1814; a former memorandum of 4th March declared that there was a reservation in favour of the rights of the empire and of his son. By a second act however he renounced unconditionally for himself and his heirs the throne of France and Italy. The emperor Alexander proposed that he should remain in Russia, and retain the title of emperor of the sovereignty of the island of Elba, and a revenue of six millions of francs to be paid by France. This was agreed to by Prussia and Austria; and England, though no party to the treaty, afterwards acceded to it. On the 20th April, Napoleon left Paris, after aCoding and the departure of 200,000 of his guards, left Fontainebleau for Elba. He ran some danger from the populace in passing through Provence, but arrived safe at Frejus, where he embarked on board the British frigate the Undaunted, and on the 4th of May landed at Porto Ferro, in the island of Elba. (See also the history of all these transactions in France, Baron Fain, Manuscrit de 1814. See also the Narrative of Napoleon Bonaparte's Journey from Fontainebleau to Frejus in April, 1814, by Count Truchses Waldburg, attendant Prussian at the court of Napoleon, 1815.) The army, which was under Gereau, who had issued an abusive proclamation against him, and other curious particulars concerning Napoleon's conduct on his journey, are contained in the latter work.

Napoleon remained in the Island of Elba about ten months. During this time all his plans for making roads, improving the fortifications, &c., but after some months, he was observed to become more reserved, gloomy, and frequently absent and lost in thought. He was, in fact, at the time, engaged in secret correspondence with his friends in France and Italy. During so many years of supreme power, attended by most splendid results, he had formed, of course, many adherents; men whose fortune was dependent on his; most of whom had lost their emoluments and prospects by his fall: the bold and aspiring, the confident in their future prospects of conquest and new organization of foreign states, who saw in Napoleon's disposal thousands of offices and situations with which to reward his old servants. The old soldiers, to whom the camp had become a home, regretted him who used to lead them from victory to victory, affording them free quarters, a continual change of scenes, and the pleasure of forming movements in the finest cities of Europe. His brothers, sisters, and other relatives, all rich, some still powerful, as Murat at Naples, felt that by his fall they had lost the main prop on which they rested. On the other side, the restored Bourbons had committed faults, and had alienated themselves to the old emigrants by whom they were surrounded; and lastly, France in general had been too long in a state of violent excitement to subside at once into quiet and contented repose. Many of the subordinate agents of the police, post office, and other departments, were in Napoleon's interest. A wide conspiracy was formed, the old republicans
joined the Bonapartists, and Napoleon was invited to return to France. (See, in Fleury de Chabulon's History of the 100 Days, an account of the intrigues carried on with Elba.)

On the 26th of February, 1815, Napoleon embarked with about 12,000 men on the island of Elba, and landed on the Ist of March at Cannes, not far from Frejus. At Grenoble, the first defection of the army took place: Colonel Labedoyere, commanding the 7th regt. of the line, joined Napoleon; the rest of the march to Paris was made by the army and the葆热将军 and Marshal Ney, the whole army; and Marshal Ney, sent by Louis XVIII, to stop Napoleon’s progress, went over to him; Macdonald and Marmont, and several other Marshals remained faithful to the oath they had taken to the King. Augereau also kept his post on the field. All information obtained in the country could depend upon Napoleon. Napoleon arrived at the Tuileries on the 20th of March, Louis XVIII having left the capital early in the morning by the road to Flanders. Napoleon’s return to Paris was accompanied with the declarations of the military, and the popular clamours in the suburbs; but the great body of the citizens looked on, astounded and silent: and he was recalled by a party, but evidently not by the body of the nation.

The Congress of Vienna was still sitting, when Talleyrand laid before them the news of Bonaparte’s landing at Cannes. They immediately agreed to join again their forces, in order to frustrate his attempts, and to maintain entire the execution of the treaties of Paris, of the 30th May, 1814, made with France under the constitutional monarchy of the Bourbon dynasty. The Austrians, Russians, and Prussian armies, who had evacuated France, resumed their march towards the frontiers of that country.

Napoleon, on his return to Paris, that he could not resume the unlimited authority which he had before his abdication. The republicans and constitutionalists sated, or not opposed his return with Carnot, Fouché, Benjamin Constant, and his own brother Lucien at their head, would support him only on condition of his resigning as a constitutional sovereign: he therefore proclaimed a constitution under the title of Acte additionnel aux Constitutions de l’Empire, 1814, 24 men and women, signed with the signature of Louis XVIII the year before. There were to be an hereditary chamber of peers appointed by the emperor, a chamber of representatives elected by the electoral colleges, and to be renewed every five years, by which all taxes were to be voted; ministers were to be responsible; judges irremovable; the right of petition was acknowledged, and property was declared inviolable. Lastly, the French nation was made to declare, that they would never recall the Bourbons; deputies from the departments came to Paris to swear to support the Napoleonic Constitution, although held on the 1st of June. The Emperor and his brothers were present at the ceremony.

The chambers opened on the 4th of June, while Napoleon prepared to march towards the frontiers of Flanders, where the allied armies were decided to carry out their ratification of the Treaty of Paris. He assembled an army of about 125,000 men, chiefy old troops, of whom 25,000 were cavalry, and 350 pieces of cannon, with which he advanced upon Charleroi, on the 15th June. Ney, Soult, and Grouchy held commands under Napoleon. On the 16th Napoleon, Bonaparte in person Marshal Blücher, who was posted with 80,000 men at Igelny, and drove him back with great loss. At the same time he sent Ney against part of the English army at Quatre Bras, which, after sustaining a severe attack, retained possession of the field of Quatre Bras, vol. 1, 1815. In consequence of Blücher’s retreat, fell back with his army to the position of Waterloo. Napoleon followed him, after dispatching, on the 17th, Grouchy, with a body of 30,000 men, to follow the retreat of the Prussians. (Grouchy’s Observations, 1815, par le General Gourgaud, Philadelphia, 1818.) On the 18th the famous battle of Waterloo took place. Napoleon’s army on the field was about 75,000, and Wellington’s force opposed to him consisted of 54,000 men actually engaged at Waterloo, of which the rest, about 16,000, being stationed near Hal, and covering the approach to Brussels on that side. There were 32,000 British soldiers, including the German Legion; the rest was composed of Belgians, Dutch, and Nassau troops. The events of the battle are well known. The battle of the 17th of June was fought with much cavalry upon the British line, gained some advantages, took possession of La Haye Sainte, but all the efforts of their cavalry could not break the British squares. In these repeated attacks, the French cavalry was nearly destroyed. At six o’clock, Bulow’s Prussian corps appeared on the field of battle, and soon after, Blücher came in person to join the Emperor. In his effort to break the English line, before the Prussians could act: he directed his guard, which had not yet taken part in the action, to advance in two columns against the English. They were received with a tremendous fire of musketry and grape, the charge of the guard was checked, but in so doing became confused, and at last gave way. Napoleon, who was following with his eye, through a spy glass, the motions of his favourite guards, turned pale and exclaimed, ‘They are mixed together!’ and galloped off to the field. The English, after a terrible battle, the battle of Waterloo, by English, French, and Prussian military writers; among the rest, Captain Pringle, of the Engineers; Captain Batty; Baron Muffling, under the assumed initials of C. de W., Histoire de la Campagne de l’Armée Anglaise et de l’Armée Prussienne en 1815, Gavarni, 1817; Gourgaud’s Narrative of the War of 1815, with Grouchy’s important comments upon it; Foy, Campagne de 1815; Napoleon’s own account in Montholon and Las Cases, and in the Memoires Historiques, published by O’Meara; Ney’s Letter to the Duke of Otranto, Paris, 1815; Rogniat’s account of the battle, and the account in Sir W. Scott’s life of Napoleon.)

The French accounts are evidently inaccurate as to several circumstances of the battle. One thing is certain, that Napoleon attacked the English repeatedly with all his force, and was repulsed with the loss of the flower of his troops: that after the last attack by his guards, at seven in the evening, which also failed, he had no reserve left; when the arrival of Blücher, with fresh troops on the field of battle, changed the whole issue into a total defeat. The astonishing firmness of the British infantry, to which several French Generals, and Foy among the rest, have paid an eloquent tribute of praise) gained the day; Bonaparte’s army fled in dreadful confusion, pursued by the Prussians, and lost cannon, baggage, and all. The loss of the English was about 2000 men and 200 officers. Of these, Grouchy was engaged at Wave, thirteen miles distant, with one division of the Prussian army, which gave him full employment, while the other Prussian divisions were marching on to Waterloo. His orders were to follow the Prussians, and attack them wherever he could meet them. (Grouchy’s Observations.) Napoleon seems to have underrated the strength of the Prussians, when he thought Grouchy’s corps sufficient to keep in check the whole of their army.

The battle of Waterloo finally closed a war, or rather a succession of wars, which was in process of an interruption for twenty-three years, beginning with 1792. As to these wars, Napoleon is only strictly accountable for those that took place after he had attained supreme power in France: in some of them, such as those of Spain and of Russia, he had no direct connection with them. In others, he gave sufficient provocation to those which Austria, England, and Prussia waged against him, the reader must judge for himself. His determination to be the dictator, the umpire of all Europe, left no chance of national independence to any one country; he had subdued all Europe, he would have reverted to his old scheme of the conquest of the East. Even his peace establishment, supposed him ever to have been at peace, was to consist of an army of 800,000 men, besides 400,000 of reserve. (Montholon’s Memoirs of Napoleon, vol. 7.) The events of the 18th were raised by conscription two millions one hundred and seventy-three thousand men, of whom two-thirds, at the least, perished in foreign lands, or were maimed for life. See the Memoirs of Laroy, one of the chief surgeons of his army, about this frightful waste of human beings. After the defeat of Waterloo, Napoleon having given his brother Jerome directions to rally the remains of the army, hurried back to Paris. The house of representatives declared itself permanent, and demanded his abdication. He was again placed in the situation of the former times, the former services of his brother, and of the claims which he had on the gratitude of France. ‘We have followed your brother (answered Lafayette) over the sands of Africa, and through the frozen deserts of Russia; the whitened bones of these battles you have left behind you, prove your triumphs were due to our long fidelity to him.’ Lucien made no impression on the assembly. He advised his brother to dissolve the cham-
The house of peers had adopted the same view as the lower house. There was but one man, it was said, who opposed Bonaparte on this question and that was his second abdication on the 22nd of June; but this time it was of his own accord, and against the advice of his intimate friends, Carnot, Luce, &c. (Résponse de Lucien aux Mémoires de Lamarque.) The abdication was in favor of his son Joseph, and Bonaparte was appointed by the chambers, and they required that Napoleon should leave France, and embark at Rochefort for the United States. General Beckler was appointed to escort him to Rochefort, where he arrived on the 3rd of July. All this did not take place, however, without controversy; an altercation occurred in the chambers, and much reluctance on the part of Napoleon; for which, see Hobhouse's Letters from Paris during the last reign of Napoleon, and Chabrol's History of the 100 Days. The allies, who entered Paris on the 7th of July, refuse to acknowledge Napoleon's right to abdicate in favor of his son, and on the following day Louis XVIII. re-entered the capital, and resumed the government.

Napoleon at Rochefort, seeing that the whole country around him was denouncing to the Bourbons, and finding that he had no chance of escaping by sea, through the vigilance of the English cruisers stationed along the coast, sent Count Las Cases and Savary to Captain Mainland, who commanded the English ship Bellerophon, to ask for leave to proceed to America, either by land or by sea, as a neutral vessel. Captain Mainland replied, 'That his instructions forbade this, but that if Napoleon chose to proceed to England, he would take him there on board the Bellerophon, without, however, entering into any promise as to the reception he might meet with as soon as he arrived in the port of London.' Napoleon was under the impression that the British government would receive him as the head of the government of the British crown, as to his future disposal. (Captain Mainland's statement of the whole transaction.) This offer was made by Captain Mainland, in his second interview with Las Cases, on the 14th July, and Napoleon, before he accepted it, addressed a letter immediately, repeating at the same time to him 'that he was not authorised to stipulate as to the reception of Bonaparte in England, where he must consider himself at the disposal of the Prince Regent.' On the 15th Napoleon left Rochefort and came on board the Bellerophon with his suite; as Captain Mainland was on the committee, to meet him on the forecastle, Napoleon said to him, 'I come to place myself under the protection of your Prince and your laws.' On the 24th the ship entered Torbay. On the 31st of July Admiral Lord Keith and Sir Henry Bunbury, under secretary of state for the navy, and Bonaparte met on board the Bellerophon, the final resolution of the British government,—that the Island of St. Helena should be his future residence. Napoleon protested against this determination, said he was not a prisoner of war, that he had come as a voluntary passenger on board the Bellerophon, that he wished to be allowed to remain in England as a private citizen, &c. On the 6th of August however Napoleon frankly acknowledged to Captain Mainland, that 'he had certainly made no conditions on coming on board the Bellerophon, that he had only consented to take the Bellerophon, as the price of the captain's conduct, which had been that of a man of honour.' On the 7th Napoleon removed from the Bellerophon to the Northumberland, Sir George Cockburn's flag ship, which was appointed to carry him to St. Helena. (For the particulars of Bonaparte's voyage, his landing at St. Helena, his residence, first at Briare and afterwards at Longwood, of his alternations first with Sir G. Cockburn, and afterwards with Sir Hudson Lowe, we must refer our readers to the minute work of Count Las Cases.)

By a convention signed at Paris, 20th August, 1815, between Great Britain, Austria, Russia, and Prussia, the custody of Napoleon's person was intrusted to the British government, and commissioners were appointed by Russia, Austria, and Prussia to combine with the British to secure his safe detention. In July, 1816, General Sir Hudson Lowe arrived at St. Helena as governor of the island. From the very first interview Bonaparte behaved uncivilly, or rather insultingly, to that officer, and this treatment was received with aggravation at every subsequent opportunity. One of Napoleon's great grievances was being styled General by Bonaparte; he not only detested Bonaparte, but detested the island unattended by a British officer. He was allowed a space measuring eight and afterwards twelve miles in circumference round Longwood, through which he might range at his pleasure; beyond these limits he was to be accompanied by four or five of his servants, and if he were ever detained as a prisoner at all. The governor however had no power to remedy these subjects of complaint. Various minor matters of dispute with the governor were laid hold of by Bonaparte and his attendants, as if with the view of keeping alive an interest in the public mind in favour of the exiles of St. Helena. We cannot enter into the particulars of this petty system of warfare, in which, as it generally happens, both parties may have occasionally been in the wrong. But it is impossible to read even Napoleon's statements, made through Las Cases, Santini, and Antoniochichi, without receiving that there was a determination on his part not to be pleased with any thing the governor could do for him, unless he had disobeyed his orders. Napoleon's mind was in a state of irritation whenever it recurred to the subject of his confinement, which made him irritable. He seems also to have had, almost to the last, some latent hope of making his escape. In other respects the particular of his life and conversations at St. Helena are highly interesting. He could be very agreeable towards visitors, and was always ready to listen to their complaints. He would see from Mr. Ellis's and Captain Hali's accounts of their interviews with him. In September, 1818, Napoleon's health began to be visibly affected, but he would take no medicines. He also refused to ride out, as advised, because he could not bear the attendance of a British officer. In September, 1819, Dr. Antoniochichi, of the University of Pisa, came to St. Helena as physician to Napoleon. Two clergymen came also from Italy to act as his chaplains. Towards the end of 1820 he grew worse, and remained in a weak state until the following April, when the disease assumed a malignant character. Bonaparte said that he believed it was the same disorder which killed his father, namely a scirrhus in the pyriform; and he desired Dr. Antoniochichi to examine his stomach after his death. He made his will, leaving large bequests to his friends and attendant. (Testament de Napoleon), and on the 3d of May, 1821, the chaplain Vignali administered to him extreme unction. Napoleon stated 'that he believed in God, and was of the religion of his father: that he was born a Catholic, and would fulfill all the duties of his religion, and that he desired his body to be buried in the cemetery of St. Helena.' On the 8th May his remains were interred with military honours in St. Helena's Valley, near a fountain overhung by weeping willows. This had been a favourite spot with Napoleons. The procession was followed to the grave by the governor, the commander, his attendants, and all the civil and military authorities. The grave was afterwards enclosed by a railing, and a sentry is kept on duty to guard the spot.

For the acts of Napoleon's internal administration see Bulletin des Lois de l'Empire and the Exégèse of his ministers; for the state of the finances see the various Comptes rendus, or report of the duke of Gaudin, and also Brezen, Histoire Financière de France; for the military institutions and organization of the army, see Tablons Politique et Militaire, which precedes Pélissier's History of the Peninsular war. Also Mémoires sur l'Empire, by Thibaudot, which is a continuation of his 'Mémoirs sur la Consulat,' the duchess of Abrantes' Memoires, and the numerous Memoirs of Napoleon's generals and ministers. See also JONAS. These Memoirs, 2 vols. 8vo, 1812, son of the emperor and of Maria Louisa of Austria, was born at Paris March 20, 1811. From his birth he was styled 'King of Rome.' After his father's first abdication in 1814 he went with his mother to Vienna, where he was brought up in the court of Francis, and was made Duke of Reichstadt. His education was carefully attended to, and he was early trained up to the military profession. After passing through the various subor
dinate grades he was made a lieutenant-colonel in June, 1831, and he took the command of a battalion of Hungarian infantry then in garrison at Vienna. He was extremely assiduous in his military duties, but his constitution was weak; he had grown very tall and slender, and symptoms of consumption developed in his system. When he learned that the physician advised a removal to Schönbrunn, which had at first a beneficial effect, but a relapse soon followed, and after lingering for several months young Napoleon died on the 22nd July, 1832, in the palace of Schönbrunn, atten-
ed by his mother, who had come from Paris to visit him. He seems to have been generally regretted at the Austrian court, especially by his grandfather, the emperor, who had always behaved to him with paternal kindness.

There is an interesting account of this young man's short career written by the third duke of Vincennes, Marie de Reastaud, Paris, 1852.

BONA/SIA (zoology), a subgenus of the true Tetramidae (grouse family), separated by Charles Lucien Bonaparte, Prince of Muscignano, and thus characterised:—Lower portion of the tarsus or Shank and the toes naked; tail long and rounded; the head adorned with a crest, and the sides of the neck with a ruff. The plumage of the female nearly the same as that of the male, and varying but little throughout the year; the flesh white.

Swainson retains the Linnaean name for the bird, and makes it the typical group of the subgenus, into which he divides the other species, and which, however, considerable doubt on the value of the types.

The Ruffed Grouse, Bonasia Umbellus of Bonaparte; Tetrao Umbellus and Tetrao toagus of Linnaeus; Tetrao Umbellus of Linnaeus and Swainson, is the Shoulder-Knot. The true grouses rivers of North America are divided into two groups:—Grouse and Grouse;—La Gélinote, a group of the Canadian Grouses;—La Gélinote de Canada and Le Coq de Brugière à fraises de Buffon;—the Pheasant of the Pennsylvanians, and of the inhabitants of the southern States; the White Fisher and Pheasant of the Anglo-Americans generally, and the Pusquaque of the Cree Indians.

Audubon says that to the west of the Alleghanies, and on these mountains, the term pheasant is generally used to designate the bird, and that the same appellation is employed to the whole group of the subgenus, till the state of Connecticut is entered, where the name of partridge prevails. Lawson uses the term pheasant. The pheasant of Carolina differs some small matter from the English pheasant, being not so big, and having some difference in feather; yet he is not as wise inferior in delicacy, but is as good meat, or rather finer. He haunts the backwoods, and is seldom found near the inhabitants. Wilson calls it throughout 'pheasant,' except in one place, where he terms it the 'pheasant or partridge of New England.'

According to the author last quoted, this bird is known in almost every quarter of the United States; is common at Moose Fort, on Hudson's Bay, in lat. 51°; frequent in the upper part of Georgia, and very abundant in Kentucky and Indiana. In the lower parts of Carolina, Georgia, and Florida, according to the same authority, it is very seldom observed, but on advancing inland to the mountains it again makes its appearance; and though it is occasionally met with in the lower parts of New Jersey, its occurrence there is much more northerly than the rest of the country; for even here they are far less numerous among the mountains than among the mountains.

Captains Lewis and Clarke found it in crossing the Rocky Mountains which divide the basin of the Columbia from that of the Missouri, and extended as far as the 49th parallel, from a measurement, from the mouth of the latter river. Dr. Richardson says that it exists as far north as the fifty-sixth parallel; and that it is very plentiful on the banks of the Saskatchewan; adding, in a note, that Mr. Drummond procured his first head of a pheasant in the valleys of the Rocky Mountains, which do not differ from those killed on the Saskatchewan. The limit of its southern range has been stated to be the Gulf of Mexico. Audubon found these birds most numerous in the States of Pennsylvania and New York, and he says that they are to be met with as far south as the Gulf of Mexico and the Choctaw territory; but that as you approach the city of Natchez they disappear; nor had he ever heard of one of these birds having been seen in the State of Louisiana.

'The manners of the pheasant,' says Wilson, 'are soli-
tary; they are seldom found in coveries of more than four or five together, and more usually in pairs or singly. They leave their sequestered haunts in the woods early in the moring, and seek the path or road to pick up gravel, and glean among the droppings of the horses. In travelling they are so quiet that the horseman who is riding with them is always able to furnish himself with an abundant supply of these birds every morning without leaving the path. If the weather be foggy or lowering, they are sure to be seen in such situations. They generally move along with great caution, with their breasts drawn close together, so that there were no hills nearer than fifteen or twenty miles. The lower parts of the State of Indiana, and also those of Ken-
tucky, were amongst the places where he so discovered them. The following is his account of the autumnal mi-
gratulations, which he seems to have first observed:

'The ruffed grouse, although a constant resident in the districts which it frequents, performs partial sorties at the approach of autumn. These are not equal in extent to the migrations of the wild turkey, our little partridge, or the pinnated grouse, but some sorties are no less obser-
vable during the seasons when certain portions of the mountainous districts which they inhabit become less abundantly supplied with food than others. These partial mov-
ings might not be noticed, were not the birds obliged to fly to their new haunts rivers away. Audubon noticed that the bands of these grouses are as numerous as those which attempt these migrations; but on the north-west banks of the Ohio and Susquehanna rivers, no one pays the least atten-
tion to the manners and habits of our birds can fail to ob-
serve them. The ruffled grouse, in the State of Ohio, in par-
ties of eight or ten, now and then of twelve or fifteen,
and, on arriving there, linger in the woods close by for a week or a fortnight, as if fearful of encountering the danger to be incurred in crossing the stream. This usually happens on the beginning of October, and is a very good order for the table, and at this period great num-
bers of them are killed. If started from the ground, with or without the assistance of a dog, they immediately alight on the nearest trees and are easily shot. At length, how-
ever, they resolve upon crossing the river: and this they accomplish with so much ease, that I never saw any of them drop into the water. Not more than two or three days elapse, after they have reached the opposite shore, when they at once proceed to the interior of the forests in search of places containing the generative plants of the ground.

They now resume their ordinary manner of living, which they continue until the approach of spring, when the males, as if leading the way, proceed singly towards the country from which they had retreated. The females follow in small parties of three or four. In the month of October, 1839, I observed a larger number of ruffled grouses migrating thus from the States of Ohio, Illinois, and Indiana into Kentucky, than I had ever before remarked. During the short period of their lingering along the north-west shore of the Ohio during the month of October, I observed a number of these birds, which they sold in the Cincinnati market for so small a sum as 12 cents each.

Wilson says that the ruffed grouse is in the best order for the table in September and October. At this season they feed chiefly upon the ripe partridge-berries, and the wild cherries, partridge-berries, the last of which give their flesh a peculiarly delicate flavour. With the former the mountains are literally covered from August to November; and these con-
stitute at that season the greater part of their food. During a deep snow they have been known to devour the horned alder, and the tender buds of the laurel. He frequently found their crops distended with a large handful of these latter alone; and adds, that it has been confidently as-
serted, that after having fed for some time on the laurel buds, their flesh becomes highly fiendish, and is not to be taken in taking of the poisonous qualities of the plant. The same has been asserted of the flesh of the deer, when in severe weather and deep snow they subsist on the leaves and bark of the laurel. 'Though,' concludes Wilson, 'I have myself eaten freely of the flesh of the pheasant, after emptying it of
large quantities of laurel buds, without experiencing any bad consequences, yet from the respectability of those, some of them eminent physicians, who have particularized cases in which it has proved delerious, and even fatal, I am inclined to believe that in certain cases where this kind of food is given, or where an illness is followed, it may be main undrawn for several days, until the contents of the crop and stomach have had time to diffuse themselves through the flesh, as is too often the case, it may be unwholesome and dangerous. Great numbers of these birds are brought to our markets at all times during fall and winter, some of which are brought from a distance of more than a hundred miles, and have been probably dead a week or two, unpicked and undrawn, before they are purchased for the table. Regulations prohibiting them from being brought to market unless picked and drawn, were probably suggested by prudence and prudence from all danger. At these inclement seasons, however, they are generally lean and dry, and indeed at all times their flesh is far inferior to that of the quail or of the pinnated grouse. They are usually sold in Philadelphia market at from three-quarters of a dollar to a dollar and a quarter a pair, and sometimes higher.

Most of our readers will remember the incident in Miss Edgeworth's admirable story of "To-morrow," where it is related that, in consequence of Basil's procrastination, Mr. Hubert took a pair of his fine ducks, and when they were suddenly seized with convulsions after eating of a pheasant, in whose crop Basil had seen what he believed to be, and what turned out to be, the leaves of Kalmia latifolia. Audubon, however, corroborates Wilson on this point, and states that the fear was ungrounded; and he adds that they have fed for several weeks on the leaves of the Kalmia latifolia it is dangerous to eat their flesh, and adds his belief that laws have been passed to prevent their being sold at that season, he states that he has eaten them at all seasons, and that he never found their crops distended with those leaves, he has never felt the least inconvenience after eating them, nor even perceived any difference of flavour in their flesh. He suspects with Wilson that it is only when the birds have been kept a long time undrawn and un-plucked that the horse is likely to get the taste of these leaves. But Audubon entirely differs from Wilson: in opinion with regard to the merit of these birds as food; for the former places them, in that respect, above the pin-nated grouse, and prefers their flesh to that of every other land-bird in the United States, except the wild turkey when in condition. Nuttall agrees with Audubon in the praise of the flavour of the bird; and Bonaparte says of it, 'Carnea biana excelle.' Audubon observes that they are brought to the market in great numbers during the winter months, from different parts of the west and in the eastern cities. At Pittsburgh he bought them some years ago at 124 cents the pair. Nuttall says that they are now greatly thinned throughout the more populous parts of the Union, and that they sell in Philadelphia and New York for 15 and 20 cents the pair.

The food of the ruffed grouse consists commonly in the spring and fall, according to the author last quoted, of the buds of trees, the catkins of the hazel and elder, even fern buds, acorns, and seeds of various kinds, among which he detected the capsules, including seeds, of the common small Canadian Cistus. * At times he has seen the crop almost entirely filled with the buds of the apple-tree, each connected with a portion of the twig, the wood of which appears to remain a good while undigested; cinquefoil and strawberries he has found in the stomach, also the leaves and boughs of Kalmia, with the favorite partridge berries. + Ivy berries, $ and gravel pebbles are also some of the many articles which form the winter fare of the bird. In summer they seem often to prefer berries of various kinds, particularly dewberries, strawberries, grapes, and whortleberries.

We will now lay before the reader the modes of capturing the bird. The following is Wilson's account:—

The pheasant generally springs within a few yards, with a loud noise, and flies with a peculiar noise from the woods beyond reach of view, before it alights. With a good dog, however, they are easily found; and at times exhibit a singular degree of infatuation, by looking down from the branches where they sit on the dog below, who, the more noise he keeps up, seems the more to confuse and stupify them, so that they may be shot down one by one.

In such cases those on the lower limbs must be taken first, for should the upper ones be first killed, in their fall they alarm those below, who immediately fly off. In deep snows they are usually taken in traps, commonly dead traps, supported on branches, in colloids, and the stomach is immediately alarmed, they frequently dive into the snow, particularly when it is newly fallen, and coming out at a considerable distance, again take wing. They are pretty hard to kill, and will often carry off a large load to the distance of two hundred yards, and still keeping a towering and crowing. Sometimes in the depth of winter they approach the farm-house and lurk near the barn, or about the garden. They have also been often taken young and tamed, so as to associate with fowls; and their eggs have frequently been hatched under the common hen, but they are not hatched. The only exception is the exceedingly fond of the seeds of grapes; occasionally eat ants, chesnuts, blackberries, and various vegetables. Formerly they were numerous in the immediate vicinity of Philadelphia; but as the woods were cleared and population increased they retreated into the interior. At present (1812) there are very few to be found within several miles of the city, and those only singly, in the most solitary and retired wooded recesses.'

Some parts of this account are impugned by Audubon. HisAYS, however, that the notion which exists in almost every district where these birds are numerous, that on firing at the lowest bird perched on a tree, the next above will not fly, and that by continuing to shoot at the lowest in succession the whole may be killed, is contradicted by my experience. At least I have been generally certain several times in this manner on the same tree, my efforts have proved unsuccessful, unless indeed during a fall of snow, when I have killed three and sometimes four. Audubon adds that it is a prevalent opinion among sportsmen and naturalists, that the peculiar sound which is made by the wings of this genus is a necessary effect of their usual mode of flight. 'But that this is an error,' he continues, 'I have abundantly satisfied myself by numberless observations. When this bird rises from the ground when pursued by an enemy or at the sound of the guns; or rather by the voice resembling that of the whole tribe, excepting the Black Cock + of Europe, which has less of it than any other species. In fact, I do not believe that it is emitted by any species of grouse, unless when surprised and forced to rise. I have often been lying in the bushes or the woods or the fields, for hours at a time, for the express purpose of observing the movements and habits of different birds, and have frequently seen a partridge or a grouse rise on the wing from within a few yards of the spot on which I lay unobserved by them. But I have never heard the noise in question from the bushy shrubs, and without producing any whirring sound.' The same author speaks of the difficulty of shooting when a covey of these birds is raised from amongst laurels, + or the largest species of bay, $ and of the necessity for having a quick eye and ready trigger to avoid their wheeling in the bushes or the intersecting shrubs. The second is very uncertain; for on being sprung a second time they fly lower and dodge among the bushes so effectually that the sportsman is completely baffled.

The pairing time of these birds is marked by a curious and sonorous act on the part of the male. Most of the grouse family gestate considerably at this period, and some produce very peculiar vocal noises: but the ruffed grouse makes the woods echo with the vibrations of his wings. The male, when he becomes acquainted with this peculiarity by the statement of eye and ear witness, will, according to Wilson's account is very good; but, as Audubon's is more particular, and our limits do not permit us to give both, we select the latter:—

+ In the article 'Black-cock,' 'Darztmore and Sedgmoore in Deovshire' are given among the localities (vol. iv. p. 402). The expression occurs in both editions of Montague (who resided in Devonshire) and in Selby, but there can be little doubt that Sedgmoore in Somersetshire, where the Duke of Monmouth was defeated, is the locality intended.

++ Kalmia latifolia. + Placobaeovium maximale.++

* Early in April,' says this indefatigable observer, 'the ruffed grouse begins to drum immediately after dawn, and again towards the close of the day. As the season advances, the drumming is repeated more frequently at all hours of the day; and where these birds are abundant, this curious sound is heard as far as the brightness of the woods in which they reside. The drumming is performed in the same drug manner:—The male bird, standing erect on a prostrate de...
The following is Dr. Richardson's description of a male killed on the 4th May, on the Saskatchewan plains:

**Colour.** Back, rump, and upper tail-coverts chestnut-brown, motteled and finely undulated with blackish-brown; the broad tips and a cordiform central mark on each feather pale-grey. Back of the neck, scapulars, and wing-coverts having the same colours, but the grey tips very narrow, the blackish-brown in large blotches, and instead of central marks, stripes along the shafts of orange-brown and brownish-white. Top and sides of the head, the tertiaris, and outer edges of the secondaries, motteled with the same. Eye stripe from the nostrils whisht. Shoulder-tuffs velvet-black, glossed with dark-green. Quills liver-brown, the outer webs barred near the base and motteled towards the tips with cream-yellow. Tail grey, finely undulated, and also crossed by about nine narrow bars and a broad subterminal one of blackish-brown. **Under plumage.**—throat and breast yellowish-brown, belly and vent brownish-white; all remotely barred, but most broadly on the sides of the belly, with blackish-brown, which also forms a band across the upper part of the breast between the ruffs. Inner wing-coverts and axillaries close-brown, barred and tipped with white. Bill and nails dark horn-colour. A male killed at the same time with the preceding, and of equal dimensions, shows more of the chestnut or orange-brown in its plumage, and the ground colour of its tail is yellowish-brown, the extreme tips and a bar next the broad subterminal dark one being grey.

Female has less of the blackish-brown colour; the shoulder tufts are orange-brown instead of black; and the subterminal bar on the tail is chestnut-coloured.

Young birds. In these orange-brown is the prevailing tint of colour.

**Form.**—Short crest on the top of the head: a fringed comb over the eye in the male. Shoulder tufts consisting of about fifteen fan-shaped feathers. Fourth quill the longest, slightly exceeding the third and fifth. Tail fan-shaped, of eighteen feathers, the central pair more than half an inch longer than the outer ones: the individual feathers nearly square at the end. Tarsi feathered more than half-way down anteriorly, and about half an inch lower posteriorly. All the toes strongly pectinated.

The dimensions, on an average, may be taken as eighteen inches in length, and twenty-three or twenty-four in extent.
Dr. Richardson states that, after a careful comparison of the specimens of Mr. Douglas's Tetrao Subisom, deposited in the Edinburgh Museum, they appeared to differ in no respects material in the Tetrao Bonasia (Bonasia), and that the characters by which Mr. Douglas distinguished his bird * are equally applicable to the latter.

Douglas, whose premature and violent death we have to deplore in common with all who are interested in the progression of natural history, has advised me to publish a paper on Bonasia Umbellus, by which he meant the Red Partridge, from the Rhone Mountains, 23° 4' N., and a few miles northward, near the sources of Peace River, a supposed variety of Bonasia Umbellus. On comparing his specimens from that country with some which he prepared in the States of New York and Pennsylvania, and on the shores of the lakes of New Jersey, he found it to be not in the least identical with the first, the northern bird was constantly one-third smaller, of a very light speckled mixed grey, having little of that rusty colour so conspicuous in the southern bird;—secondly, the ruffle consists invariably of only twenty feathers, short, black, and with but little azure glossiness; the crest feathers were few and short. 'Should these characters, adds the author, 'hereafter be considered of sufficient importance for constituting a distinct species, it might perhaps be well to call it Tetrao umbelloides.'

It is described as variety or species, it would certainly belong to Bonaparte's subgenus Bonasia.

We cannot conclude his article without earnestly pressing upon the consideration of those who are interested in such subjects, the ease with which the ruffled grouse might be made to produce the most desirable effect, provided that they were cultivated with Audubon, that in England and Scotland there are thousands of situations perfectly suited to the habits of this noble species of game. Audubon even goes so far as to say that he has not a doubt that a few years of attention will render this bird as numerous in these parts as the grey partridge; and we hope that this hint will not be lost on the sportsmen of Great Britain.

BONASONI, GIULIO, a native of Bologna. The precise date of his birth is unknown, but it was probably about 1498; the date of his death is equally uncertain; we only know that he was alive in 1572. It is conjectured, but without sufficient authority, that he studied painting under Lorenzo Subbattini. The few of his productions that remain do not exhibit any extraordinary power. As an engraver he is excelled by few, for though we should now consider him very defective in the mechanical treatment of the plate, he worked with the gusto of a genuine artist. He wrought almost entirely with the burin; and if he fails occasionally in the outline, he always catches the spirit of his original. His copies are so free, and yet so delicate and eating away of the landscape, he doubtless reduced his work to a point. His back grounds are flat and hard, his drawing sometimes uncertain, and his handling frequently very harsh; but there is so much grace and delicacy in his females and children—so much activity in his young men and majesty in his old—so much authority in his execution, that the expression of the great works which he copied are more valuable than those of many later and more dexterous artists. He has engraved from the works of Raphael, Michel Angelo, Titian, Parmignan, and many of the great painters; for he displayed his taste as much in the choice of his subjects as in the execution. He has left many engravings from original designs which are characterized by much grace and agreeable simplicity, but are wanting in force, and rather scat-tered than connected; any of his works are very scarce. (Malvasia; Lani; Strutt; Cumberland.)

BONASSUS. (Bison.)

BONAVENTURA, ST., was born at Bagnores in 1221. At twenty-one years of age he became a friar of the Order of St. Francis, and was sent by his superiors to Paris. He, as well as Thomas Aquinas, of the Dominican Order, became involved in contentions with the University of Paris, which denied the acaulemous honours, as well as the exercise of public professorship, to individuals of the mendicant order. But a bull of Papal V., being against individuals of the same species often very memorable in their markings.

* Linn. Trans. vol. vii. p. 157. But it should be remembered that Douglas describes the eggs of his Tetrao Subisom to be dingy white with red spots; whereas the eggs of Bonasia Umbellus are described as being spotted. The fact is, in a species a covery of the same species often very memorable in their markings.

cause. The pope gave sentence in their favour but still the Parisian university refused to grant the laures to Bonaventura and Thomas Aquinas, and Gerard of Abbville from the theology of the Rhone, 23° 4' N., a few miles northward, near the sources of Peace River, a supposed variety of Bonasia Umbellus. On comparing his specimens from that country with some which he prepared in the States of New York and Pennsylvania, and on the shores of the lakes of New Jersey, he found it to be not in the least identical with the first, the northern bird was constantly one-third smaller, of a very light speckled mixed grey, having little of that rusty colour so conspicuous in the southern bird;—secondly, the ruffle consists invariably of only twenty feathers, short, black, and with but little azure glossiness; the crest feathers were few and short. 'Should these characters, adds the author, 'hereafter be considered of sufficient importance for constituting a distinct species, it might perhaps be well to call it Tetrao umbelloides.'

It is described as variety or species, it would certainly belong to Bonaparte's subgenus Bonasia.

We cannot conclude his article without earnestly pressing upon the consideration of those who are interested in such subjects, the ease with which the ruffled grouse might be made to produce the most desirable effect, provided that they were cultivated with Audubon, that in England and Scotland there are thousands of situations perfectly suited to the habits of this noble species of game. Audubon even goes so far as to say that he has not a doubt that a few years of attention will render this bird as numerous in these parts as the grey partridge; and we hope that this hint will not be lost on the sportsmen of Great Britain.

They are employed instead of promises by word, or by unsealed writing, for the following reasons. First, a bond (like every covenant) to pay a sum of money may be enforced against the obligor, although no legal motive or consideration existed for making it (which is not the case with a verbal promise or a promissory note for its payment), for a debt made payable by the law to be in writing and sealed will, in many cases, be enforced against him, at the suit of the obligee, by a decree for specific performance of the agreement, or by an injunction against its breach; and thus, even where the penalty in a bond is insufficient, the obligee is not always without remedy.

The courts of Law do not consider that an implied covenant is created by the condition of a bond, so as to allow the obligee to bring an action upon it; but they, as well as those of equity, so far take the condition to be evidence of a contract upon which the bond is founded, as to hold it void, if the condition is unlawful. For though, as before said, a bond without consideration may be valid, yet a bond made for an unlawful consideration, or upon an unlawful contract, is void, like every other deed so circumstanced.

Penal bonds have almost superseded, in general use, bonds without condition, or single bonds. Even when a bond is intended to secure the payment of money, the constant practice is to make it in the form of a bond for money, and thus a condition of a penalty attached to it, which is really to be paid, with a condition of making the bond defeasible upon the latter sum being duly paid with interest. The chief advantage of such a bond over a single bond was, not that any more money than was fairly due to the obligee was secured under it (for the stat. 4 and 5 Ann. c. 16, forbids that), but that full advantage could be taken, from which the debt was satisfied, might be obtained, if within the penalty; whereas, under a single bond for payment of the principal and interest at a certain day, no interest beyond that day could be claimed. That defect of the single bond, however, is supplied by stat. 3 and 4 W. IV. c. 42, s. 28.

A bond is sometimes made by or to several persons together. In such case, the bond may have different effects, according as it is prepared, as either a joint bond, a several bond, or a joint and several bond. In a joint bond, the several obligations are not applicable equally to covenants, and is noticed under that title. [Covenant.]

The several modes in which a bond may be discharged (when not actually satisfied) may also be learned by referring to the same of the laws by which the binding or the discharge of covenants, which equally apply to bonds, are mentioned.

BONE, a living organ of complex structure, forming in the higher animals the basis of the fabric of the body. The human body is composed of bone, and bone is composed of soft gelatinous matter and buoyant in water, need no solid support; but all animals that possess solid organs, and whose body rests upon particular points, must have some substance of a dense and inflexible nature to afford to those various tissues and structures the requisite resistance and support. Throughout the animal kingdom the substances that serve this purpose are the salts of lime, sometimes the carbonate, sometimes the phosphate, and at other times both combined in different proportions. When in the bone the proportion of lime is preponderant, it is called lime predominates, it contains the substance called shell; when there is a greater proportion of the phosphate it is called a crust, as in the coverings of the lobster, the crab, and so on; but when the earthy matter consists almost wholly of the phosphate it constitutes bone.

When an animal possesses bone as the solid support of its fabric, it indicates a high degree in the scale of organization. Bone is an elaborate structure found in no class below the vertebrata. Even the lowest order of this, which is the lowest class of animals, is wholly destitute of it; for it is not found in large tribes of fishes, the shark, the sturgeon, the ray, &c. In these, the least highly organized substance called cartilage is substituted, and accordingly these fishes are called cartilaginous, in contradistinction to the bony fishes. The class in which we find bone as the dense and inflexible substance which sustains the soft parts of the body, and which affords points of resistance for the action of those parts, consists either of shell or crust, or of some modification of these inorganic matters, and not of true organized bone.
In general the inorganic matter which performs the office of bone in the lower animals is placed on the exterior of the body, and often indeed forms its external envelope; true bone, on the contrary, is always placed in the interior. Even when it approaches the surface, bone is always covered by some soft part, as muscle, membrane, skin, &c. Crust, also, as is well known, is composed in part of the bone, which is an inferior animal, is thus external, the soft parts being internal; but in the higher animals the skeleton is always internal, and the soft parts, which are sustained by it, and which re-act upon it, are external.

The structure of the animal economy is chiefly mechanical, and the mechanical purposes to which it is subservient require that it should be of different sizes and forms. In the human skeleton there are commonly enumerated 260 different bones, which present every variety of size, form, and structure. It is from this diversity that they are divided into three classes: the long and round, as the bones of the upper and lower extremities: the broad and flat, as the bones of the skull; or the short and square, as the separate bones that compose the vertebral column. The long bones are adapted for motion, the flat for protection, and the square for motion combined with strength. Accordingly the long bones, which are adapted to communicate a free range of motion, are moulded into lengthened cylinders, and form so many levers, constituting organs of locomotion, exerting a force of participation in the performance of their office, as is seen in the fin of the fish, in the wing of the bird, and in the limbs of the quadruped. In the employment of the flat bones for the covering of some of the more tender and delicate organs, as the brain and spinal column, the bones are thick in proportion to their strength, as it is manifest in the vaulted roof of the skull; while in the construction of the vertebral column, composed of the short and square bones, which are so adjusted as to afford a limited range of motion with a great degree of strength, so many and such opposite purposes are in conflict, by means so simple yet so efficient, that no fabric constructed by human ingenuity approaches the perfection of this admirable piece of mechanism.

The structure, formation, and connexion of the individual bones accomplishes in the most perfect manner the following mechanical uses:—1. By their hardness and firmness they afford a support to the soft parts, forming pillars to which the more delicate and flexible organs are attached, and kept in their relative positions. 2. By the same properties of hardness and firmness they defend the soft and tender organs, by forming solid and strong cases in which such organs are lodged and protected, as the case formed by the bones of the cranium for the lodgment and protection of the brain; and also the bones of the vertebral column for the lodgment and protection of the spinal column; and the bones of the thorax, for the lodgment and protection of the lungs, the heart, and the great vessels connected with it. 3. By affording fixed points for the action of the muscles, and assisting in the formation of joints, they aid and are indissolubly connected with the muscles in accomplishing the function of locomotion.

Bone is a complex organ, and the arrangement and combination of its constituent parts are highly curious. It is composed essentially of two distinct substances, an animal and an earthy matter. The animal matter consists of organic substances, both in its nature and in its arrangement, to cellular membrane; the earthy matter consists of phosphoric acid combined with lime, forming phosphate of lime. The cellular membrane is aggregated into plates or laminae, superimposed one on another, leaving between them intercellular spaces or cells, in which is deposited the earthy matter, phosphate of lime.

This structure of bone is rendered manifest by subjecting it to fire. If bone be placed in a charcoal fire, and the heat be gradually increased, it appears, on cooling, as white as chalk; it is extremely brittle; it has lost very much of its weight, yet its bulk and shape are little changed. This is such a warm substance that it is consumed by the fire, while the earth is left unaltered. Over the surface of a bone which has been treated are visible a number of minute crevices, the spaces which were filled, in the natural state of the bone, with the animal matter; and on breaking the bone across, the size and shape of the cavities which contained the marrow become manifest. If, on the other hand, the same bone be placed in an acid sufficiently diluted to prevent its injuring the animal membrane, and yet strong enough to dissolve the phosphate of lime,—if for this purpose it be macerated in dilute nitric or muriatic acid,—every particle of the phosphate of lime may be removed, and the animal matter alone will remain perfectly uninjured and unaltered. Accordingly, the remaining substance retains the exact figure and dimension of its organic constituents, and the same material properties and mechanical properties. It is so soft and flexible, that if either of the long bones of the human arm, that for example called the radius, be treated in this manner, it can with the utmost ease be bent into a knot. By the first process the earth is obtained, depoited of its animal constituent; by the second, the membranous matter free from the earth. In the bone both are combined; in every constituent atom of there is an earthy in intimate combination with an animal matter. The first gives it hardness; the second tenacity; the two together give it strength. But by analysing the bones, the various qualities, which in unorganized matter are scarcely compatible, are combined. By increasing the proportion of phosphate of lime any degree of hardness can be obtained: the bony portions of the ear, the bony portions of the teeth, for example, are as hard as flint, or even flint; but substances so hard would not do for the ordinary purposes of bone, because they would be brittle in proportion to their hardness, and would be productive of fatal mischief whenever they were subject to any sudden and violent concussion. But bone is made compact and strong by the elastic matter which is the basis of the structure, and not only acts as a strong cement interposed between the calcareous particles, but, by the increase of its relative proportion, is capable of modifying the rigidity of the thinnest bone. Bones not only differ so much from one another in their comparative hardness, according to the office which each has to serve, that no two bones possess the same degree of rigidity, but no bone is equally hard in its entire substance. When a section of a bone is made in such a way as to show its structure throughout, it is seen to consist of two varieties, a hard or compact, and an alveolar or spongy substance. In general the compact forms the external and the spongy the internal portion of the bone: the compact part of the bone possesses a more or less scarcely any visible arrangement, without apparent fibres and laminae; but towards the inner part of the bone the substance becomes less and less dense, until at length it presents the appearance of minute and delicate fibres, which intersect each other in every direction, forming the cells termed canaliculi (lattice-work). The transition from the compact to the spongy or cancellated part is not marked by any distinct boundary; the one passes into the other by insensible degrees, showing that there is no essential difference between them; and indeed it is evident, when examined in the densest part of the bone there is scarcely any trace of specific organization, it is made up of fibres and plates perfectly similar to those of the spongy or cancellated part, differing from it principally in its greater degree of condensation. Often in the centre of the bone there is scarcely even of the spongy matter, but a hollow space is left, which is filled up with a series of membranous cells in which the substance called marrow is lodged.

In the arrangement of the fibres in different bones, so as to adapt them to the specific purposes of each bone as an exquisite mechanism. Where the principal object is either extensive protection, or the provision of broad surfaces for the attachment of muscles, the osseous fibres are so disposed as to form flattened plates, as in the bones of the skull. When the bone is composed in a very small part, as in the limbs which have to sustain the weight of the trunk, and to confer extensive powers of locomotion, the bones are modelled into lengthened cylinders, generally somewhat expanded at the extremities for greater convenience of muscular connection, but the bone itself is almost constituted to resist the forces applied transversely, that is, tending to break the cylinder across; it has been often stated that a given quantity of materials could not possibly have been disposed in a manner better calculated for such resistance than those in the form of a tube or hollow cylinder. The hollow stems of vegetables derive their chief strength from
possessing this form. Bones also are rendered both lighter and stronger by being made hollow than if the cylinder had been solid; and as it is in the middle of the shaft that the strain is greatest, so it is here that the cavity is largest and the resistance most effectual.

The chemical composition of bone may be easily understood from the word itself. The earliest deposit is a white substance which contains the phosphates of lime; the animal matter is condensed albumen. Albumen constitutes the basis of membranous matter of all descriptions. As it actually exists in bone, it bears a close resemblance to cartilage, and is probably identical with it. Into the composition of bone there likewise enters a quantity of jelly, which may be extracted from it by boiling, and the younger the animal the larger is the proportion of jelly.

It has been stated that the central cavities of some of the larger bones are filled with a gelatinous or jelly-like colloidal matter contained in a series of membranous cells, which, like those in which the fat is deposited [Adipose tissue], do not communicate with each other. Even the pores and canals of bone also contain a kind of jelly matter, which is supposed to differ from marrow only in possessing a greater degree of fluidity. This jelly matter is secreted in longitudinal canals, which pass through the solid substance of the bone, together with its nutrient vessels. The use of the marrow, and of the modification of it which constitutes the jelly matter, is not well understood. Without doubt it serves the same purpose on an economy as the other oily secretions. [Adipose tissue]

All bones are covered by a membrane named, on account of its affording them an external envelope, periosteum. The outer surface of this enveloping membrane is connected to the periosteum of the surrounding cells by means of strictures, by means of which the outer layer of the periosteum is firmly adherent to the substance of the bone. This adhesion is effected by innumerable fibres or threads, which on examination are found to consist of blood-vessels. The periosteum is in fact the membrane on which the nutrient arteries of the bone rest, divide, and ramify in order to enter the osseous substance. These threads are much more numerous in the child than in the adult; and accordingly the adhesion of the periosteum to the bone is much firmer in the former than in the latter, as the quantity of blood distended by the arteries is greater. Moreover, in general, the inner surface of bones is also lined by a fine and delicate membrane, commonly termed the internal periosteum, the continuation of which forms the membranous bags in which the marrow is contained.

Great attention has been paid to the phenomena attending the growth of bone, and the facts ascertained relative to its progressive development are not only interesting and important in their own nature, but afford a singular confirmation of the correctness of the preceding statements as to its growth. The bone is composed of two portions. The one, of very early period of its existence, that is, about the seventh or eighth week after conception, the parts destined to become bone are found soft, gelatinous, and semi-fluid; but the figure of several of the larger bones can already be distinctly traced. As yet there is not a particle of bone contained in these gelatinous masses, nor anything approaching the consistence of a solid compact substance. It is merely a semi-fluid matter contained in a delicate membrane. The newly-formed arteries of the system, by the agency of which the different structures are to be developed, gradually penetrate the organized membrane, the arteries which are to form bone at length arrive at these pulpy masses. By degrees these masses are observed to acquire more consistence; and at length pass from a soft and semi-fluid state into that of a solid and firm substance, which assumes the appearances which resemble the properties of cartilage. This cartilage, at first transparent and colourless, after some time exhibits in different parts of its surface opaque whitish spots. These spots, when examined by the microscope, are found to consist of a number of delicate lines, which progressively increase in thickness, and form the bone. The bone is dispersed through them, indicating that the blood-vessels of the parts are so much enlarged as to be capable of admitting the red particles of the blood; and now particles of bone are copiously and rapidly deposited, inasmuch that the parts are increasingly formed and rigid, and this rigidity increases to such a degree that the blood seems to be scarcely capable of forcing a passage through its vessels, compressed as they are by the dense matter which accumulates around them in all directions.

Thus the first animal matter that forms the basis of bone appears to be jelly; for jelly, alburnum, a more highly organized substance, is soon substituted; as the process of ossification advances, the proportion of jelly gradually diminishes, while that of alburnum increases. The first deposition of bony particles takes place in cartilage; this cartilage, and a few particles of jelly matter are deposited, and this first-formed cartilage is replaced by a totally new deposition of animal matter, namely, the membranous substance which subsequently forms a constituent part of bone.

Such is the process of ossification, in regard to which it has been justly and beautifully said by Dr. Rogert, that as sculptors, before working upon the marble, first execute a rough model of an elastic material; so the first business of the arteries is to prepare a model of the bone, constructed, not with the same material of which it is afterwards to consist, but with another of a simpler and softer nature, namely cartilage. Until the other parts of the fabric have proceeded so far in their development as to have acquired a certain degree of fluidity, and to bear as well as to require the support of more massive and rigid structures, this flexible and elastic cartilage may be employed with great advantage as its substitute. A hard and unyielding structure would, in the early stages of its formation, be unsuited to the purposes of a frame, and as the fabric is enlarged, the necessity for mechanical support increases, and further provision must be made for resistance to external violence. The removal of the cartilage may be compared to the taking down of the scaffolding which has been employed for the support of a building. When the scaffolding is not taken down at once; each part is carried away piece by piece, as the operation of fixing in their position the beams and pillars of the edifice proceeds. The way is cleared at first by the absorption of the central part of the cartilage, and the earlier portion of the fibres are deposited in its room. Greater activity is now displayed in the arteries, which rapidly enlarge in diameter, assume more active functions, and hasten to execute their task by depositing granules of calcareous phosphate: these are laid down in the cartilage, and the part is afterwards arranged in well-marked regular lines, so as to form continuous fibres. When a great number of these delicate fibres are gathered together, and connected by other fibres, which shoot in various directions across them, a texture composed of an assemblage of long spicula or thin plates is constituted. In the cylindrical bones the spicula prevail, and are arranged longitudinally, parallel to one another and to the axis of the bone. In the flat bones the fibres have a radiated arrangement, shooting out from the spot where the first deposit took place as from a common centre. The fibres from different centres is not indiscriminate, but is regulated by definite laws. Each distinct bone is formed from a certain number of ossific centres, which altogether constitute a system appertaining to that bone only, and not extending to the adjacent bones. These pieces unite together and are united by a natural affinity, and they refuse to unite with the bony fibres proceeding from neighbouring centres and belonging to other groups.

Were this the whole of what takes place in the formation of bone, not much would remain to be ascertained, but it proceeds mainly from that by which a shell is produced; for a shell is the result of successive depositions of calcareous matter, forming one layer after another, in union with a corresponding deposit of animal membrane. But the subsequent changes which occur are in the constitution of the bone totally dissimilar to that of shell; for the addition of the parts that are once formed and have not been removed is subject to any further alteration. It is a dead though perhaps not wholly inorganic mass; appended indeed to the living system, but placed beyond the sphere of its influence. But bone is a living organ, and may be an integral part of the system, partaking of its changes, modified by its powers, and undergoing continual alterations of shape, and even renewal of substance, by the actions of the living vessels.

The form which had at first been rudely sketched slowly advances towards perfection in the course of its growth, and the general proportions of the parts are still preserved, the finished bone exhibiting prominences and depressions in the same relative situation as at first, and not only having
similar internal cavities, but being frequently excavated in parts which had before been solid. During all these gradual alterations of shape, however, there is no stretching of elastic parts, for all the osseous fibres and laminæ are rigid and unyielding, and in this respect retain an analogy with the walls of an amphitheatre. The bone is so formed as to lend itself in no other way than by the actual removal of such parts of the young bone as had occupied the situations where vacuities are found to exist in the old bone. We find, for instance, that in the early state of a bone there are no internal cavities; but the whole is taken up by collagenous tissue. At a certain stage of ossification cells are excavated by the action of the absorbent vessels, which carry away portions of bony matter lying in the axis of the cylindrical or in the middle layer of the flat bones. Their place is supplied by an abundant cellular tissue which grows over the hollow and when this exceeds, while new layers are deposited on the outside of the bone and at the end of the long fibres, the internal layers near the centre are removed by the absorbent vessels, so that the cavity is further enlarged. In this manner the outermost layer of the young bone gradually changes its relative situation, becoming more and more deeply buried by the new layers which are successively deposited, and which cover and surround it; until by the removal of all the layers situated nearer to the centre it becomes the innermost layer, and is itself destined in its turn to disappear, leaving the new bone without a single particle which had entered into the composition of the original structure.

It has been found that, by mixing certain colouring substances with the food of animals, the bones will soon become dyed with the same substance. This was first done by Mr. Belcher, who gives the following account of the circumstances that led him to notice it. Happening to be dining with a colico-printer on a leg of fresh pork, he was surprised to observe that the bones, instead of being washed, were not paved with a coating of the dye; and on inquiring into the circumstances he learned that the pig had been fed on the refuse of the dyeing vats, which contained a large quantity of the colouring substance of madder. So curious a fact naturally attracted a good deal of attention among his friends. He therefore took pains to ascertain the time required to produce this change, and to determine whether the effect was permanent or only temporary. The red tinge was found to be communicated much more quickly to the bones of growing animals than to those which had already attained their full size. Thus the bones of a young pig were tinged of a rose colour in twenty-four hours, and of a deep scarlet in three days; while in the adult bird fifteen days were required merely to produce the rose colour. The dye was more intense in the small bones, especially those in which the heart, the centre of circulation, while in bones of equal solidity, but more remote from the heart, the tinge was fainter. The bone was of a deeper dye in proportion to the length of time the animal had been fed upon the madder. When this diet had been continued for some time it became gradually more tinted, till it entirely disappeared.

From the whole of what has been stated it is manifest that bone possesses blood-vessels, nerves, absorbents, and all the parts that form the essential constituents of an organized and living body. It is as much alive as the heart or the brain. In its natural and healthy state it has indeed but few blood-vessels, and still fewer nerves, and the existence of absorbents is rather inferred than demonstrated, these vessels being too minute to be visible; but their existence is apparently implied from many of the phenomena which have been detailed, and which are wholly inexplicable but upon the supposition of the existence and action of these vessels. Moreover, bone is subject to all the diseases of living parts, inflammation, tumefaction, suppuration, and gangrene, and when diseased it often becomes quite insensible. There is indeed no difficulty in supposing that the animal matter is alive, but how is it possible for life to be attached to an earthly salt? Yet on a careful examination of this subject, as has been forcibly very recently pointed out by Mr. Belcher, it may be fairly said that there is no point out any essential difference between the earthly and the animal substance. Both are derived from the blood; both are deposited by vessels connected with the arterial system; both possess a specific determinate arrangement; both are capable of the most exquisite sensitivity, and again carried into the mass of the circulating fluids; both, before they are ultimately expelled from the system or are again applied to any other use in it, undergo decomposition, in order that part of their elements may be employed in forming new compounds, while the remainder may be rejected by some of the excretory passages. 'I should be inclined therefore,' says this physiologist, 'to say that the blood is not the producer of the bone, but that both are formed by different processes, entirely distinct from each other.' This opinion is, as is well known, also arrived at by the physiologist, who says that 'the bone is not the mere residue of the blood, but that the blood is necessarily a living substance, and that bone is not a dead, but a living substance, because the bone is so generally; but the phlosphate of lime or its elements while they are circulating in the blood or passing off by the kidney or alimentary canal, cease to be so, in the same manner as the carbon which is expelled from the lungs, and which in the mouth are not considered as being alive, although they may perhaps a short time before have been employed in the composition of a muscle or nerve. This view of the subject will lead us to reject the mechanical idea which has been so much entertained of the growth of the bone, which matter of the bones is simply deposited in the interstices of the membrane, and has its particles kept together merely by the cells in which they are lodged. I conceive that the earthy particles have an affinity for each other, and perhaps for the membrane by which they are combined in a form that belongs to them as necessarily as to any of the soft parts, although it produces in them a peculiar arrangement which may not be found in any other substance.' (Monro's Outlines of the Anatomy of the Human Body; Bostock's Elements of Physiology; Roger's Animal and Vegetable Physiology; Sir Charles Bell's Lectures on the Hunterian Preparations in the Museum of the Royal College of Surgeons, in Illustration of Anatomy and Physiology; Abernethy's Physiological Lectures; Southwood Smith's Principles of Physiology.)

BONES have been of late years very extensively used as manure, especially on poor and dry sands and gravels. Many cargoes from abroad have been imported for this purpose into the eastern parts of Britain. Bones have thus become probably the most valuable article of commerce with Germany, Belgium, and Holland; so much so that the governments of some of these countries have had it in contemplation to subject them to an export duty.

Experiments on bones as a manure were made long before their use was thought of for this purpose. Many experiments were made, and many bones in general, were not attended with a very favourable result, in consequence of the bones not being broken into sufficiently small pieces, or being put upon the land too fresh a state. But since mills have been erected to crush them to a smaller size, and the proper use of them has been ascertained, the advantage of this manure, in distant and uncultivated spots, where the carriage of common stable or yard manure would have been too expensive, and where it could not be made for want of food for cattle, is inacculable. By means of these mills bones have been broken down into small pieces and the bones, half-inch bones, and dust. Most of the bones procured from London and the manufacturing towns have undergone the process of boiling, by which the oil and a great part of the gelatine which they contain have been extracted.

At first sight we should be led to imagine, that having lost much of the rich animal matter which they contained, they would be proportionately less effective in the soil. This, however, does not seem to be the case from the comparative experiments which have been made. The bones do not, however, as a matter of fact, produce the same effects of oiling and boiling, and those which were quite fresh. All those who have used bones extensively report, that little difference can be observed between them; some even give the preference to those from which the oil and glue have been extracted. But oil and glue form exceedingly little of the bones, and this being so, is it to be explained? It appears, from the result of many experiments, that bones do not furnish much nourishment to the roots of plants until they have undergone a certain degree of decomposition. The fat and the gelatine, being intimately bound up with the bones, and which latter being not decomposed, may remain a long time in the earth without decomposition. As a proof of this, it has been found that bones which had lain in the earth for many centuries, on spots where ancient battles were fought, aforesaid, or on analysis, are found not to have undergone any great decomposition, even in the earthy parts, as fresh bones would have done. Bones analysed by Pourceroy and Vauquelin were found to consist of
It would seem, then, that the great effect of bones, as a manure, must depend on the phosphate of lime; and the effect of the bones in the cases of which I speak is founded on the exactness of the analysis. A close examination of the fields and pastures to which the bones have been added or ploughed in, has led us to surmise, that much of their importance depends on the mechanical texture of the bone, and on its power of absorbing and retaining moisture; for if a plant, which vegetates with bones, is cut down in a field manured with bones be pulled up, it will be almost invariably found that small pieces of bone are attached to the roots; and when these are minutely examined, the smaller fibres of the roots will be found to have grasped them, and to pervade their cavities, which will always be found more or less moist. The moisture, then, and a small portion of the remaining gelatin dissolved in it, forms the food on which the plant has thriven. The more the bones have undergone fermentation, the more soluble the gelatin will be. In its fresh state, it is only soluble in very warm water, and the oil rebels to the attacks of many of the stronger acids; but at the expense of a large part of the superiority of boiled bones. They have undergone a fermentation. The residue, although not deprived of all its animal matter, is much more porous, and will imbibe and retain moisture in its pores. The food of the plants is here readily prepared and dissolved, and kept in such wise as to prevent the danger of being washed through a porous soil or evaporated by the heat. The solid substance, which is chiefly phosphate of lime, has a stimulating effect, and assists that of the more soluble parts. But phosphate of lime is not soluble in water, and does not conduce to the growth of vegetation in the earth; its effect therefore is not so great as to account for the general result. The universal experience of all those who have used bones as a manure proves that they are of little or no use in very stiff or wet soils. In stiff clays the pieces of bone do not rot down, and in these soils, phosphates are necessary for their decomposition, and in very wet soists the advantage of these small but numerous reservoirs of moisture is lost. Hence it is easily seen why bones are of less use in such soils.

But it is ascertained that the effect of bones on the crop is much increased when they have been previously mixed in heaps with ashes, burnt clay, or light loam, or made into a compost with the dung of animals, and with vegetable substances. In this case, the fresh bones will evidently become more soluble. For bones when thrown into holes and left unboiled for fermentation will extract and decompose the oil and a great part of the gelatin, which, mixed with the other ingredients of the compost, will much enrich them; while the bony residue will be in the same state as it would have been if put out to rot. By this process, bones are mostly converted into manure. By comparing all the facts, we naturally come to the conclusion, that the most economical use of bones is to extract from them the oil and gelatin, which, if not of sufficient value for the manufacture of glue or of ammonia, may be used as a supplementary food for pigs, in the form of a broth or pot liquor, which, mixed with meal, will greatly accelerate their growth or increase their fat. For this purpose the bones should be broken in the mill to a moderate size, like those called natch bones; they should then be boiled a few hours to extract the lipoids; and by the addition of this, on cooling, will be found to form an animal jelly of more or less strength, which may be thickened by boiling, and finally dried into a glue or digestible powder, which will keep for a considerable time.

The price of fuel and attendance being calculated, it will be seen whether this operation is a real economy or not; if not, the bones may be allowed to ferment in a heap, being mixed with sand or coal-ashes. In this case, they may be ground at once to the size called half-inch; in the other, they must be passed again through the mill after having been boiled.

The mode of applying bone manure to the land is either by sowing from twenty to forty bushels of them per acre by the hand broadcast, as is done with corn, and harrowing them in with the seed; or by putting them into the drills by a machine made for the purpose, which is an addition to the common drilling machine. This is the most ap

proved method, and the crop for which they are best adapted is turnips, after the land has been well cleaned and tilled. About twenty-five bushels per acre is sufficient to produce a good crop on poor light sands, and it does not appear that beyond this number they have a proportionate effect. It is better therefore to repeat the dressing than to put on much at once. When used as a top-dressing for grass-land, they have, in some instances, produced a great and very durable improvement, when the quantity was large; but in most cases, a medium portion is advantageous to reserve them for turnips or corn. Bones have been drilled with wheat, at the rate of thirty bushels of bones and two and a half of wheat per acre, and a good crop (twenty-four bushels per acre) has been obtained on very poor soil: while they have produced almost no effect on any bones, in order to ascertain the effect, did not produce sufficient plants to cover the ground or return the seed.

When bones are compared with farm-yard dung the result has been various, and chiefly owing to the seasons and the nature of the land. In strong loams or in very moist seasons the farm-yard dung, put on at the rate of from ten to fifteen tons per acre, has decidedly the advantage, not only for the turnips but for the subsequent crops. On very dry gravelly soils and in dry summers the bones produced more turnips; and when the comparative cost is taken into consideration, bones may have added almost to any amount, if bespoken in proper time. Many farmers in England have, by bringing into cultivation by means of bones, as the only manure which could be procured, and without which they must have remained in a barren state. Bones have also been compared with rape cake and mild dust, but there has not been a sufficient number or proper spread of manure to test the result, but it is probable that these last, when they can be procured sufficiently cheap, would greatly assist the effect of bones if mixed with them, and would reduce the success of a crop of turnips more certain under such circumstances. Of this subject the practical farmer knows that a good crop of turnips is the foundation of all the subsequent crops in the course. A great advantage of manuring land with bones is that they introduce no weeds, which farm-yard dung inevitably does. This is probably the reason why they have never been used on land which has been fallowed; and turnips being the usual crop first sown on such light lands as are most benefited by bone-manure, the greatest number of experiments have been with this crop. That they are an excellent addition to the list of ammonia manures is well known. It is shown by the answers to queries made by the Donecator Agricultural Association, of which an interesting report has been published. Whatever difference there may be in the opinion of some of the numerous agriculturists who have sent their results on this subject to the editor, bones on different soils, all who have tried them to any extent have continued the use of them. This simple circumstance says more in favour of bones than the most elaborate argument, and the only question will be, at what expense they may be procured, and on what lands they have the best effect. When the immense quantity of bones from the cattle daily slaughtered is considered, and the readiness with which any commodity for which there is a demand is procured in commerce, there can be no great fear of a de
deficiency of them, for their price is likely to be increased by a great demand as to make it a matter of nice calculation, whether their use may be attended with profit or not. If once they are very generally used, their price will arrive at a maximum, and find its natural level. At present they may be obtained in London and at the principal ports for about 2s. per bushel coarsely ground, and 2s. 6d. to 3s. when in a finer state; and at that price, with a small addition for carriage, they will be found the cheapest manure that can be purchased for dry, gravelly, and sandy soils.

To which it will be observed that the grind bones consists of two iron or steel cylinders, with grooves cut transversely. The circumstance, the projections being cut so as to form strong teeth. These turn upon another by means of machinery, so that the teeth of one run in the groove between the teeth of the other, as may be seen in the annexed cut.

An instrument has also been invented for distributing
bones, ashes, rape-dust, and similar dry manures in the drills at the same time with the seed. It consists of a very simple addition to the common drilting machine, and is described under the word DRILL.

The cut represents Bonellia viridis, which is found in the Mediterranean.

BONET (JOHN PAUL), is said to have been attached to the secret service of the king of Spain; he was also secretary to the constable of Castile, out of friendship towards whom he undertook the instruction of his brother, who had been deaf and dumb from the age of two years. Only one person is known to have approached to success in the art of instructing deaf-mutes, previous to Bonet. This was Peter Ponce, also a Spaniard, and a monk of the order of St. Benedict, who must be regarded as the first instructor of the deaf and dumb. It does not appear that Bonet had any acquaintance with the means pursued by his predecessor; he represents himself as the inventor of the methods which he describes. (De Gerando, De l'Education des Sourds-Muets, tom. i. p. 312.) ‘Great knowledge and uncommon learning,’ says the translator of De l'Epée’s method of instructing the deaf and dumb, ‘qualified Bonet for the province of tuition; in which he succeeded beyond every hope. The work which he published at Madrid in 1620 is now very rare: it is entitled Reducción de las Letras, y arte para enseñar a hablar los Mudos. It commences with showing that the deaf-mute must be made to distinguish and to form the letters of the alphabet, which for this purpose are reduced to their most simple elements. Having remarked that the deaf are only mute by reason of their deafness, he explains how various kinds of knowledge may be imparted to them by means of sight, to which they are unable to arrive by the ear. These means are indicated by nature, the language of action being a natural language. The deaf and dumb who have never associated together would very soon come to understand each other by the use...
The other works of Bonet attest his industry, but are of less utility: 'Mercurius Compilatus, seu Index Medico-Practicus,' Geneva, 1683, fol.; 'Medicina Septentrionalis Historia,' Geneva, 1685, 2 vols. fol.; 'Polyalthia,' 3 vols. fol. Geneva, 1690, 1691, 1693. This is a bulky commentary on Johannitana Syntagma Nosocomia.

Bonet being made a baronet died on the 29th of March, 1659, in the seventeenth year of his age. He possessed great knowledge, and was distinguished for his modesty and modesty. (Eloy, Dictionnaire Historique.)

BONFADIO, JACOBO, was born in the beginning of the sixteenth century at philosopher, was born on the bank of the lake of Garda. He studied at Padua, and afterwards proceeded to Rome, where he became secretary to Cardinal di Bari, with whom he remained three years, which he mentions in his letters as the happiest of his life. He was then established in Padua, where he died, Bishop of Cardinal Ginucci, but here he met with an enemy in the person of another dependant of the Cardinal, on whose account Bonfadio left. He was on the point of going to Spain with an envoy of the Duke of Mantua to Charles V. when the envoy suddenly died. He then went to Naples, where he became intimate with Pietro Cardesecchi, who was afterwards burnt at Rome for heresy. From Naples Bonfadio wandered about several parts of Italy, until he was invited by Bembo, who was then living at Padua, to come to his house and take the habit of a Jesuit. In 1537 he became assistant to the Tructor. Bonfadio appears to have remained at Padua five years. From Padua he now and then visited the banks of his native lake, and also occasionally Coloniosa, a villa of his learned friend Marc Antonio Flamino. He has praised, in his letter to the Duke of Mantua, the scenery of those places. At one time he had the idea of founding an Academy on the banks of the lake of Garda, and he applied to Count Martimengo and other noblemen of Brescia to counteract his project. Having accepted in 1543 the project of the professor of Bologna, who was also said to have been in the service of the prince of Carignan, and to have continued his employment as a teacher of the deaf and dumb for many years.

BONET, THEOPHILUS, an eminent physician, was born at Turin, near the end of March, 1629. His family was originally Italian and of noble rank, but his ancestors had removed from Rome to the south of France about a century previous, in order to enjoy the free exercise of their religion. His grandfather being compelled to have recourse to some means of gaining a livelihood, chose the profession of medicine, and obtained such eminence, that he was invited to Turin to become physician to Charles-Emmanuel, Duke of Savoy. But he appears to have possessed too much independence of mind to have retained the court favor. Of the period of his life, particularly from 1556, Andrew Bonet was born. He also practised medicine, and after losing his first wife he removed to Geneva, where, having married a second time, he had two sons, John and Theophilus. The hereditary celebrity of the family determined his son to study medicine, and though the son arrived at great eminence, he left no work to testify his ability. Theophilus, after having visited many of the most celebrated universities, took the degree of doctor of medicine in 1645. Soon after this the Duke of Longueville appointed him to private practice, but he quickly rose to eminence by the success of his practice.

During the course of his practice he was diligent in collecting observations on the progress and terminations of diseases, which formed the basis of his subsequent publications. His earliest work was 'De Morbis Medicorum, id est, Diagnosticon, Animadversiones et Observationes Practicas,' Geneva, 1668, 2 vols. 12mo. Each time this work was reprinted he enlarged it and altered the title, so that the edition of 1697 was called 'Lavabitius Medicus extensius,' 4to. Geneva; and that of 1687, 'Methodus Vitandorum errorum qui in Praxi occurrunt,' 4to.

Incurable deafness having compelled him to retire from practice, he devoted his time to digesting his observations, and published his celebrated work, in 1679, entitled 'Bonet's Practica,' which a large part of medical men used to consult. It appeared in 1700, 3 vols. folio. This formed the basis of the great work of Morgagni, 'De causis et sedibus morborum,' which highly esteemed the labours of his predecessor. Littauud also availed himself of this valuable repertory of facts in morbid anatomy.

No. 291. [THE PENNY CYCLOPAEDIA]
able opinion of his character and learning. He asserted the authority of the Roman see over the churches of Illyricum, which was then in a state of political anarchy, and his letters were consequently written from Boniface to Rufus, bishop of Thebolonia, and also between the two emperors, Arcadius and Honorius. Boniface died A.D. 423, and was succeeded by Celestine I.

BONIFACE II. succeeded Felix IV. in 530. It is recorded of him that, although a native of Rome, he was sent by Ostrogoth Alaric to become a deacon of the Roman clergy assembled in the Basilica Julia chose Dioscorus, while the rest met in the Basilicas of Constantine for the election of Boniface. The schism lasted only twenty-eight days, when Dioscorus fell ill and died. Boniface was then elected without opposition, and in the elections of bishops, and he also condemned the practice of a bishop appointing his own successor. Platina, Vita Pontifici.

He died in 532, and was succeeded by John II.

BONIFACE III. was elected in March, 607, and died in November of the VI. year. He obtained the imperial Phocas the acknowledgment of the supremacy of the see of Rome over all other churches. This circumstance renders his pontificate remarkable. He was succeeded by

BONIFACE IV., who consecrated the Pantheon, having first removed the images of the heathen gods, and dedicated it to the Virgin Mary and all the martyrs. He transformed his paternal house in the country of the Marsi into a monastery, on which he bestowed all his property. He died in 615, and was buried in St. Peter's church. Boniface IV. was canonized by the church, and his body was later transferred to the basilica of Rome. He was succeeded by Benedetto, who was himself succeeded in 619 by

BONIFACE V., a Neapolitan, who died in 622, and was succeeded by John III., the native of Tuscany, and son of the Bishop Adrian, succeeded Formosus in 625, and died fifteen days after his election. He was succeeded by Stephen VII.

BONIFACE VII. Cardinal Franco or Francone, was elected in a popular tumult, when Benedict VI. was seized and strangled in 974. Boniface himself was expelled from Rome in the following year, having incurred general detestation through his licentiousness and cruelty. Boniface is not considered a legitimate pope, though his name is registered as such in most chronological tables. He returned to Rome in 985, and put John XIV. in prison, where he died of hunger, as it is reported. Boniface again assumed the papal dignity, which he retained a few months, till August of the same year, when he died, and John XV. was elected pope.

BONIFACE VIII. Cardinal Benedetto Gaetani of Anagni, succeeded in January, 1294, Celestine V., whom he had persuaded to abdicate on the ground of incapacity, and whom he afterwards confined in the castle of Fumone, where Celestine died a few months after, under suspicious circumstances. Boniface interposed between Charles II. of Anjou, king of Naples, and the French at the election of Albert of Orléans to the see of Rome. He made the latter consent to give up Sicily to Charles. But the Sicilians would not be surrendered to their hereditary enemy; they proclaimed Frederic, James's brother, their king, and resisted both the arms of Charles and the intrigues and the threats of Boniface, who launched his excommunications against them without effect. In 1297 James of Aragon came to Rome and was induced by Boniface to turn his arms against his brother Frederic, on which condition the pope granted him the investiture of the crown of Sicily.

In the contest about the succession to the German empire, after the death of Rudolf of Hapsburg, Boniface took the part of Adolf of Nassau against Albert of Austria, Rudolf's son. At the same time Boniface waged a war of destruction against the Colonna, a powerful feudal family, which held possession of several towns and estates in the countries of Rome and Naples. The origin of this quarrel is not clearly ascertained. It appears that two cardinals of the house of Colonna had opposed Boniface's election, and although no papal letter ever came from Boniface accused them of having dissipated the treasures of the church, of holding correspondence with Frederic of Sicily, and other charges. The two cardinals wrote to the French and other kings against Boniface, complaining of his disputed election, which they considered as his own affair. Upon this the pope excommunicated the whole family of Colonna and their adherents, calling them heretics, and declaring that they had forfeited their honours and estates and property of every sort. Further, he proclaimed a crusade against them, besieged Preneze, which he took and put to the sword, and banished the whole house of Colonna, relics of the same family. The two cardinals escaped to France, and Sciarra their uncle was obliged to conceal himself in the forests near Anzio, whence he afterwards escaped by sea only to fall into the hands of pirates.

Boniface proclaimed the first jubilee in the year 1300, granting by a bull a plenary indulgence to all those who should visit the sanctuaries of Rome in that year. This attracted an immense multitude of foreigners to Rome. The pope, from his house in Rome, which he himself, recogins the number of strangers at 200,000 at one time, had the number of 700,000, in the circle of Asti states the number of all those who visited Rome during that year at two millions. This jubilee brought to Rome a vast quantity of money. Before Boniface the plenary indulgence had been granted only to those who went to the crusades for the deliverance of the Holy Land.

Boniface, still aiming at the reduction of Sicily, sent for Charles de Valois, brother of Philip le Bel, king of France. On arriving at Florence Charles supported the faction of the Nejet, by which Dante and many others were exiled. He then went over to Sicily, but after a desultory warfare peace was made, and Frederic was acknowledged as king of Trinacria in 1303, on condition of his paying to the Roman see a tribute of 3600 onza, or 15,000 florins. A merchant travelled from France to Rome in the year 1305, to carry to King Philip le Bel. The pope pretended to share with the king the tithes levied on the clergy; he also created the new bishopric of Pampures without the king's consent, and he appointed the bishop his legate in France. The bishop behaved insolently to the king, who ordered hym in charge to the Archbishop of Narbonne. Upon this Boniface excommunicated the king, placed his kingdom under interdict, and wrote to Albert of Austria, confirming his election and inviting him to make war against France. Frederic assembled the states of the kingdom and laid before them twenty-nine charges against the pope, accusing him of simony, of heresy, of licentiousness, and even of sorcery, and appealing to a general council of the church. Some of the charges were either invented or exaggerated by Philip, who was a most unprincipled man, although at the time Boniface's conduct was far from irreproachable. The next measure of the pope was to proclaim all Philip's subjects released from their allegiance. The king resolving to put an end to this, his dangerous struggle, sent Guillaume de Nogaret, a notary, with unceasing letters for the partizans of the Colonna and the other enemies of the pope. Nogaret was joined by Sciarra, who had escaped from captivity. The pope was at Anagni, when Nogaret and Sciarra suddenly entered the town followed by a strong body of horsemen, and arrested Boniface himself. Nogaret was for taking him to Lyons, where the council was to assemble; but Sciarra insisted upon Boniface abdicating, abused him, and even struck the old man with his gauntlet. Boniface behaved with dignity and firmness; he was kept three days in confinement, during which it is said he would not take any food. At last Cardinal del Fesco induced the people of Anagni to rise and deliver the pontiff, and Sciarra and Nogaret were obliged to leave the town. Boniface returned to Rome, but his health had received so much injury that he was unable to sit up for about nine years of a most turbulent pontificate. F. Dupuy and A. Baillet have written the history of the quarrel between Boniface and Philip le Bel. Boniface was one of the most strenuous assertors of the apostolical supremacy of the pope over princes and nations, and in spiritual matters. He was an invertebrate persecutor of the Guibelines, for which Dante has alluded to him at length in canto xxvii. of the "Inferno."

BONIFACE IX., Cardinal Pietro Tuscanelli, a Nepos of Boniface VIII., was elected in 1399 by the cardinals at Rome after the death of Urban VI. This was the time of the great Western schism as it is called, which began between Urban and Clement, styled the VItth, who held his court at Avignon. Clement having died in 1394, the cardinals then elected another, that of Benedict XIII. Boniface however continued to exercise the papal authority at Rome, regardless of the Avignon popes and conclaves. Endeavours were made by several
souvereigns to assemble a council and put an end to the schism, but both Boniface and Benedict were averse to this measure.

Boniface died at Rome in 1404, and was succeeded by Innocent VII. The church of Rome has ever since acknowledged Urban and Boniface and their successors as legitimate popes, and considered Clement and Benedict as anti-popes. [Benedict, Anti-pope.]

During his pontificate of nearly fifteen years Boniface was involved in petty quarrels, but afterwards recognised the more fortunate Ladislaus as king. Perugia and other towns of Umbria and the Marches acknowledged the pope as their suzerain in 1378, and the province of the Marches, being addicted to a worldly policy, having seized upon the ecclesiastical revenues for temporal purposes, and enriched his brothers and nephews.

BONIFACE, SAINT, a native of Devonshire, was born about A.D. 866. He became a monk, and resided for a time in a convent at Southampton, where he acquired reputation for learning and piety. When thirty-six years of age he set out for Rome, where he expounded to Pope Gregory II. his wish to preach the gospel to the heathen nations of Germany. Pope Alexander IV. and Pope Urban II. supported his scheme and appointed him the bishop of Mainz, from Northumberland, as well as Kilian, an Irish bishop, had preceded him. The pope having sanctioned his vocation, Boniface joined Willibord in Frisia, from whence he repaired to Thuringia, Franconia, and other parts of Germany. There he was met with the acrimony of idolatrous and Christian rites, and the people plunged in ignorance and barbarism. For more than thirty years he laboured in converting and civilizing the rude natives, and he well deserved the title which has been given him of 'the Apostle of Germany.' He founded four cathedrals, Erfurt, Bamberg, Aichstadt and Würzburg, with a school attached to each, and he established numerous monasteries both for monks and nuns. These monasteries were generally built upon uncultivated grounds, which were cleared and tilled, and the monks, a whole community, kept in close contact with the diffusion of Christianity. The monastery of Fulda, founded by Sturm, one of Boniface's disciples, was the means of reclaiming a vast tract of ground which had been till then covered by forests. In discussing in our days the question of the use and abuse of monastic institutions, we ought not to overlook the fact, that monks were the great civilizers of modern Europe in the dark ages which followed the destruction of the Roman Empire. Boniface was made archbishop of Mainz, and metropolitan of all the new dioceses on the right bank of the Rhine. He was despatched to Rome in another capacity as his arduous task, and Willibald, Wunibald, Burchard, Luillus, Lebin, Willhaid, and the nuns Lioba, Thecla, Walberg and others, obeyed his summons. Boniface was supported by Carloman, and afterwards by Pepin, sons of Charles Martel, who, by authority or influence, placed a garrison in his hands. 

Without the protection of the Frank prince (he observes in one of his letters to his friends at Winchester) I could neither govern the people nor protect the priests and virgin consecrated to God; without his prohibitions, without the penalties which he denounces on those who refuse to obey me, vain would be the attempt in this country to abolish heathen ceremonies or idolatrous sacrifices. (Epistolæ S. Bonificati, quoted by Dunham in History of the Germanic Empire, vol. i.)

In reading the regulations of Boniface for the order of the monks included in his garrison, we are struck with the low state of morality which he found in Germany, of the difficulties he had to encounter, not only on the part of the heathens, but from the converts themselves, and of the beneficial effects which his injunctions and example must have had on the people at large. In 753 Boniface again visited Frisia, a country still in great measure pagan.

Having assembled a multitude of converts he pitched tents in a field for the purpose of giving them confirmation, when a band of heathens fell upon the encampment, and killed or ate the bishop and several of the sacred procession. In the year 757, Joannes, a disciple of Boniface, was sent to Frisia to propagate the gospel, and he returned much mazed and killed. (Vita S. Bonificati in Malbon, tomo iv., and Dunham's History of the Germanic Empire.)

BONIFACIO, a town of Corsica, on the S. extremity of the island, facing the coast of Sardinia. It is a fortified town, has a good harbour, and about 3,000 inhabitants. The town is built on a hill which projects into the sea. Bonifacio was originally a colony of the Genoese in the 14th century. The country near Bonifacio is one of the most fertile and pleasant districts of Corsica. It produces corn, fruit, and has good pastures. Bonifacio is 44 m. S.E. of Ajaccio, in 18° 57' 40" W. lat. (BONIFACIO, STRAITS OF, dividing Sardinia from Corsica. The narrowest part between Longosardo in Sardinia and the southernmost point of Corsica, E. of the town of Bonifacio, is about 10 m. wide. At the E. entrance of the Straits are several clusters of islands, the principal of which is the island of Cargese, belonging to Sardinia. North of this Corsican coast is the island of Cavallo, and between that and Maddalena is Santa Maria, with several other islets and rocks, which make the Mediterranean sailors in general avoid passing through the Straits, unless they are compelled. The islands are arranged in a straight line along the coast. The islands in these Straits were noted for contraband trade during the maritime war in the time of Napoleon.

BONIN, or ARZOBISPO ISLANDS, a group of islands in the North Pacific, lying about N. by E., extending from 32° 44' N. lat., as seen to the southward to 26° 39', and probably running much farther in that direction. In longitude the kohn portion is comprised by 143° and 144° E. long. The only account of them is from the visit of the Blossom in 1877; and Captain Beechy in Observations in the Solomon Islands, gives the description of a group called Yolas del Arzobispo in a work published many years ago at Manilla (Navegacion Especulativa y Pratica), as to leave no doubt of their being the same. They had been expunged from the chart all but three, called Holy Baby, Holy Cats, and Holy Soil; the Shaloo, one of the first, had passed to the N. and S. without seeing any other than these; but in 1823 they reappeared in Arrowsmith's map.

They consist of three distinct groups: the northern, called Parry's Group, are mostly small islands and rocks. The central and southern, called Beechey's Group, are larger, separated from each other by narrow and deep channels. In the southern group the islands appear to be still larger and higher, but of this portion little is known, as Captain Beechy had not time to examine them. It appears that in 1850, three small islands were anchored among this southern group, and that Mr. C. gave his name to the port, and was the first who furnished any certain information concerning this archipelago.

The islands are of volcanic formation, and smoke is seen to issue from some of them: they are steep and high, and wooded to the shores. The coast is broken, and full of grottoes. They: in many places basaltic columns of a grey or greenish hue appear, resembling the Giant's Causeway in miniature; olivine, hornblende, and chalcedony are found. The shores are surrounded with sharp rugged rocks, and often with coves: the sea is generally calm and deep. They are quite uninhabited, but at the time of the Blossom's visit two of the crew of a whaler which had been wrecked in Port Lloyd were living on one of the islands, and had got a piece of ground under cultivation. The rest of the crew of three men and ten dogs, and two preferred remaining. The islands abound in the cabbage and fan palms, the former of which is an excellent vegetable, areca, pandanus, tamanu of Otaheite, and various other trees; the sea also contains abundance of turtle, ray, eels, cray-fish, and a great variety of others, of the most beautiful colours. Of birds, there are brown herons, plower, rails, snipe, wood-pigeons, crows, and small birds: also a species of vamara bat, some of which measured three feet across the extended wings, with a body eight inches long. These islands are not marked on the charts, but are shown on the map, is derived from Japanese accounts of a group called Bon-In Sima; but setting aside the geographical inaccuracy of the position there assigned them, it appears from the description given by M. Abel Remusat, in the Journal des Scavans, Long, 1824, and the chart of the English Discovery, that they appear to abound in good harbours, and are now frequently visited by whalers, who go to them for turtle, fish, and the cabbage palm. (Beechy's Voyage to the Pacific and Bering's Strait.)

BONN, one of the eleven minor circles of the circle of Cologne, which forms that part of the Rhenish provinces belonging to the crown of Prussia, which is designated the

X 2
province of Cleves, Juliers, and Berg." It consists of a portion of the former possessions of the archbishops of Cologne, and contains within an area of about 105 square miles, 1 town, 55 villages, and 28 hamlets, 76 churches and other places of worship, 98 public buildings, 2,376 houses, and 6,898 dwelling-houses. The Rhine, with the exception of the burgomastership of Villingen, which lies on the right bank of that river, is its eastern boundary. The soil is throughout productive, and favourable to the growth of all descriptions of grain; the average annual produce of wheat in good years is estimated at about 392,800 Berlin bushels, or 72,800 British imperial quarters. Wine and tobacco are also raised. The population, which was 35,203 in 1816, 36,952 in 1825, and 42,447 in 1831, is at present about 44,800. Exclusive of the city of Bonn, the universal university circle contains one gymnasium, and one Protestant and forty-four Roman Catholic national or elementary schools. In every forty inhabitants there is not more than about one Protestant. The burgomastership of Bonn, one of the nine into which the circle is divided, contains the town and university of the same name, a place of some antiquity, situated on a gentle eminence, in a pleasant and fertile country, on the left bank of the Rhine. In records of a remote date it was called Bunna, a word which Arndt derives from the Celtic Bahn, a spot containing productive fields, pastures, and meadows. Bonn became head-quarters of the sixth Roman legion, and, according to Antoninus's 'Itinerary,' was afterwards kept up as one of the Roman strong-holds on the Rhine. It rose ultimately to be a place of some note, and was the residence of the bishops of Bonn, whose see was confined ad 70. According to Tacitus (Hist. iv. 20), the Roman troops under Herennius Gallus were defeated near Bonn by the Batavians under Claudius Civilis; the ditches of the place were filled with dead bodies, and numerous were the arrows from the arrows of their brother combatants. Bonn and Nevigrum, and such are repeatedly mentioned in the subsequent account of the Batavian contest as places where the Roman generals mustered their forces. Bonn is less frequently alluded to it is affirmed by some, though scarcely on sufficient grounds, to have been the place of Christian baptism in the 8th century of the Christian era, in consequence of the preaching of Maternus, bishop of Cologne; and it is known that Helena, the mother of Constantine the Great, about the year 316 built the church in this town, on the site of which the Minister church was afterwards built. In the year 355 Bonn was destroyed by an irruption of German tribes, and in 359 was rebuilt by the Emperor Julian. Under the Frankish sovereigns it is said to have borne the name of Chelles, and in 1240 the Rhine at Bonn, in his second campaign against the Saxon army (1181), it was almost ruined by the Normans. In 1240 it was surrounded with walls and a ditch by the archbishop of Cologne, who conferred a variety of immunities upon it: from the 13th century, it was the chief and only the archbishops of Cologne. The Emperor Charles IV., was scouring the Rhine here in 1346, about which time it had risen into sufficient importance to conclude a treaty of defensive alliance with Cologne and other towns on the Rhine, when it undertook to furnish an auxiliary of 500 men. During the Thirty years' war Bonn was exposed to great sufferings and vicissitudes. In 1673 the French, who had possessed themselves of the place, were besieged in it by the prince of Orange and Montecuccoli, and surrendered after a slight resistance. Having possession of it fifteen years afterwards, they extended and greatly strengthened its fortifications. In 1689 it was taken by Frederick III., elector of Brandenburg, after a three-months' siege; and in 1702 it was captured by the duke of Marlborough, the operations of the siege had been conducted by the famous Marshal Marath Coehorn. The fortifications were razed in 1717; and in 1777 Maximilian Friedrich, elector of Cologne, founded the academy, which was enlarged into a university in 1784. This university was dissolved by the French, and remained in a state of ruin and neglect until Bonn's possession of the town, but was re-established upon a more extensive scale by the presentation of Prussia, on the 18th October, 1818, the twenty-fourth article of the act of the congress of Vienna having transferred it to him as part of the provinces of the Rhine. This renders the Rhine its eastern boundary: it is skirted on the south by the former electoral palace, and on the north and west by the Minster church, and a succession of gardens which stretch as far as the banks of the river. It has at present the appearance rather of a modern than of an ancient town, and though it cannot be termed a well-built place, for several of the streets are narrow and ill-lighted, its appearance at a distance, with its吶the empire of the Rhine 吗● 路 section of the country 吗● 路 the river also renders the atmosphere damp. Bonn forms a circular figure of nearly equal diameter from north to south and east to west: the distance from the Cologne to the Coblenz gate does not exceed ten or twelve minutes' motion, with the current. The river here is navigable in a substantial manner, twenty-nine public edifices, eight churches and chapels, nine mills and manufactories, five gates, and a population of about 12,000 (1789, 9460; 1800, 8833; 1811, 9167; 1823, 10,860; and 1825, 11,526), besides the garrison and between 700 and 800 students. The inhabitants derive the principal means of their subsistence from the university, from their fields, gardens, and vineyards. The chief manufactures in the town are cottons, silks, and sulphuric acid. The buildings without the gate are on the increase, and dispose of their produce through the commission (Verschaffungscommission), as to be the town to the open areas the market-place is the most spacious; but the square planted with trees next the Minster, and thence called the Minster-square, is the finest. There is a remarkable edifice in Bonn to the Minster or church of St. Cassius, an ancient Gothic structure, probably of the twelfth or thirteenth century. In the interior is a bronze statue of St. Helena, kneeling at the feet of the cross, as well as basso-reliev in white marble, representing the birth and baptism of the Saviour. In the church of St. Remigius, there is a fine altarpiece in oils, in which Spielberg the painter has represented the baptism of Clovis, king of the Franks, by the patron saint. The town-hall, which is on one side of the market-place, is a large and imposing edifice, and consists of a double flight of stone steps in front. Bonn also has a gymnasia; is the seat of the superior board of mines for the Rhenish possessions of Prussia, of two tribunals for civil and criminal affairs, and of a central department for taxes and crown revenues; and the associations it possesses an academy of naturalists, styled the 'Leopold-Caroline Academy' (which was first instituted at Schweinfurt in 1652, received extensive privileges from the emperors Leopold I. and Charles VII., was afterwards re-established at Rhoen in 1705, and removed to Bonn in 1818), and the society of the Lower Rhine for promoting the sciences of natural history and medicine. Upon the re-establishment of the university in the year 1818, Frederic- William, the present king of Prussia, appropriated the educational institutions of the university to the southern seminaries; and when the rescript under which it was re-opened his majesty expresses his expectation that 'the university will proceed in the spirit of the act for its endowment, and promote true piety, sound learning, and wholesome morals among the youth resorting to it for study.' It received the title of 'the Rhenish University of Frederic-William,' in the year 1828, and is composed of five faculties, Protestant theology, Roman Catholic theology, medicine, jurisprudence, and philosophy. There are attached to it 12,000 students, three of which, the medical, juridical, and philological, consist of several professors (late Professoren), and four seminaries, viz., one for students of Protestant theology, and another for students of homiletic catechetical Protestant theology, a third for philologial students, and a fourth for the natural sciences. It has a library of about 50,000 volumes, a medical institute for clinic, and another for poly-clinic, with which an establishment for the cure of invalid students is combined, a clinic for surgery and diseases of the eye, another for obstetrics, an anatomical theatre and museum, a cabinet of surgical instruments, botanical gardens, a natural history museum, a museum of natural history, geological collections, an apparatus for natural and experimental philosophy, a museum of antiquities, &c., and an observatory. At a distance of less than fifteen minutes' walk from the town lies the country residence of the former electors of Cologne, Clemens, near the village of Poppelsdorf, which contains the collections in natural history, geology, &c., the chemical and
BON

Yorkshire, of Ripple in Worcestershire, and of East Dero-
ham in Norfolk, and a prebendary of St. Paul's. Much
of this promotion was due to the favour of Cromwell, whose
schemes for the reformation of religion Bonner promoted.
In 1533 he was appointed one of the commissioners for
students; at the close of 1826 they amounted to 1002;
at that of 1829, to 925; but the numbers at the end of 1834
had declined to 897. There are five elementary schools
in the town, as well as a free-school for 309 poor children,
several private cabinets of coins, engravings, &c., an excel-
 lent library of scientific publications and a mineralogical
collection attached to the board of mining, and several
benefent institutions. The agricultural institute, with
an area of 120 acres devoted to its purposes, and a ma-
nufacturing establishment founded and supported by
Bonnings at Poppelsdorf. Bonn lies in 59° 44' N. lat., and 9° 44'
E. long.

BONNEFOY or BONFIDIO, EDMUND, a writer
on Oriental law, or law of the Eastern Empire, was born 20th
October, 1556, at Chabellin near Valence, in France. Having
applied himself to the law, he was early appointed colleague
to the celebrated Cujiacius, in the chair of law, in the uni-
versity of Valence, in which situation Cujiacius thought so
highly of his virtues, and also of his talents and acquire-
ments, as in one of his works he dedicated to the dead, that he were be on
his death-bed, and asked, like Aristotle, to name his successor,
he could name none but Bonnefoy. Bonnefoy was near
being assassinated in the massacre of St. Bartholomew, and
was only rescued from the fury of the people by his friend Cujiacius. Governor
of Geneva, had appointed a to chair; he lectured three times a week on
Oriental jurisprudence,—a chair for which he was eminently
qualified by his knowledge of the languages, particularly
Hebrew, Greek, and Latin. In 1573 he published *Jura Orientalis*;
and two other books in Latin; in 1576 he published a Greek text was accompanied by a Latin translation by
the author, and was meant to comprise the laws civil and
eclesiastical of the Eastern or Greek empire. The first
book contains the constitutions of the emperors of the East,
from Constantine to MichaelPalaeologus; the second con-
tains the decrees of the archbishops and patriarchs of
Constantinople; and the third the decrees and letters of the
other patriarchs and pontiffs. Bonnefoy died at Geneva,
6th February, 1574, being then about thirty-eight years of
age. The historian De Thou, who studied under him, gives
him an excellent character, calling him *homus probus et simplex.* ('De Thou, Hist. lib. 59; Verdier, Bibl. Francaise,
Malte-Brun.)

BOSS, EDMUND, Bishop of London, died 1569.
He was born at Hanley in Worcestershire, and according
to tradition was the natural son of a priest named Savage
by Elizabeth Fordham, who afterwards married Edmund
Bonner, a Sawyer at Hanley. Strype, who wrote in 1721,
asserts that Boss was of noble birth, and that he was citi-
zening by his authority Baron Lechom, whose ancestor had been
an intimate friend and patron of the bishop. The opinion of
Bonner's contemporaries was that Savage was his father.
An epigram written on the picture of him in Fox's *Acts
and Monuments* 'whipping Thomas Hinsnow, says,

"Nomen nee matris, nee gentis patria.
Qui patre Savage natum, fause que Bonner
Dispelle: hic est Romanos Otiosium.*

In the year 1519 he was admitted a student at Pembroke
College, Oxford (then Broad-Gate Hall), where in 1530 he
took on two successive days the degrees of Bachelor of the
Canon and Civil Laws, and he was ordained about the same
time. In 1535 he was admitted to the degree of doctor,
and had acquired a high reputation. Cardinal Wolsey made him one of his chaplains and mas-
ter of his faculties and jurisdictions. In consequence of
these offices, Bonner was attending on the cardinal at
Cawood, where the latter was arrested; and Stow mentions
that, at the very moment when he had completed the
hearsay, the news came that Cardinal Cawood with the king's warrant for
Wolsey's arrest, the cardinal and his household were at
bed in the hall at Cawood, and his great cross fell on the
head of Bonner and drew blood; wherewith Wolsey said,
shutting his head, ‘Must omne pertinax; quae teneat, cum
draw he a signer, I must stay...’ says Stow, ‘this must
not be taken for a sign or token of that which followed.’

Soon afterwards we find Bonner chaplain to Henry VIII., in-
habituated of the livings of Blaydon and Cherry Burton in

After the death of Edward VI. Bonner was restored by
Queen Mary. His first act was to depose the bishops in
his diocese, and set up three processions in St. Paul's
before the queen's ordinance to that effect. It would be
to tedious to follow him in all the long list of executions
for religious, which make the history of that reign a mere nar-
rative of bloodshed. Fox enumerates 125 persons burned
in his diocese; and his hearth was during this reign; and
a letter from him to Cardinal Pole (dated at Fulham, 26th
December, 1556) is copied by Holinshed, in which Bonner
justifies himself for proceeding to the condemnation
of forty-two persons on the altar the self-same in substance that was hanged and
shod upon the cross, he (Hooper), like an ass (as he is an
ass indeed), falsely changed and turned the word that into
as, like an ass, saying that I had said as it hanged, and as
it was alied upon the cross. At another time he said to one
of his accusers that he spake like a goose, and to another,
that he spake like a woodcock.

When Queen Elizabeth succeeded to the throne, Bonner,
with the other bishops, went to meet her at Highgate (19th
November, 1558) at Whittington, kneeling on their
allegiance, which she very graciously accepted, giving
to every of them her hand to kiss except Bishop Bonner,
who she omitted for sundry severities in the time of his

In the year 1559, he was summoned before the privy council,
and on the oath of supremacy being tendered, and his re-
}anus to take it, he was deprived a second time of his
bishopric and indicted for a prenuniation. He escaped
the penalties attached to this charge, but he was confined for
the rest of his life to the Marshalsea, where he died on
September 5th, 1569.

The public acts of Bonner's life sufficiently show the
character of the man; but there are anecdotes of him which
afford additional proof, if any were wanting, that a certain
amount of tenderness of heart and humanity were
not taken to the Marshalseas from the council where the
oath had been administered to him, a man exclaimed—"The
Lord confound or else turn thy heart!" Bonner answered
"The Lord send thee to keep thy breath to cool thy porridge,"
After his deprivation a man called out to him—'Good morrow, Bishop Quondam': 'Farewell,' answered he, 'knave semper.'

Burnet says of him that he little understood divinity, but was a great master of the canon law, wherein he was excelled by very few in his time.

Besides the authorities quoted above, Wood's *Athenae Oxonienses* and the *Biographia Britannica* contain valuable notices of Bonner; the article in the latter is written with great care and accuracy. For his career and death he settled a pension of 500l. per annum. His superior temper did not permit him to enjoy his good fortune; and his dishonorable conduct in presenting to the Academy of Antient Music a madrigal as his own, though the composition of Lotti of Venice, convinced his executors of its imposturity. In 1733 he then went to reside in Paris, where he wrote much sacred music for the Chapelle du Roi, and at the peace of Aix-la-Chapelle was invited to Vienna by the emperor, to compose music for the rejoicings on that occasion.

The exact period of his decease does not appear, but it is supposed that he almost attained his hundredth year. For the King's Theatre he composed several operas, now entirely forgotten; and in 1721 he published a volume of *Comedie et Duetti*, dedicated to George I., a subscription for two guineas for the privilege that he gained by 100l. These are engraved on copper, and the rank, as well as number, of the subscribers shows by what patronage Bononcini was at first supported.

BONNYCASTLE, JOHN, late professor of mathematics at the Royal Military Academy, Woolwich, where he died May 15, 1821. He was born at Whitchurch in Buckinghamshire, and came to London early, where he married at the age of nineteen. His wife dying soon after their marriage, he became tutor to several noble families, residing at Euston, in Northamptonshire, till he obtained a place at the Woolwich Academy, where he finally became professor. These particulars are all that we find in the periodical publications of the time of his death. He is stated to have been a good scholar, and much attached to poetry; his poetry particularly to Shakespeare.

Bononcini is known by a large number of excellent elementary works, which being still on sale, it is not necessary to enumerate. His *Guide to Arithmetic* has long had a great circulation. His treatises on mensuration and astronomy are very good of their kind; but his *Elements of Algebra* (not the abridgment, but the work in two volumes, octavo, 1813) is a very excellent performance, and shows great knowledge of the state of the science. He had not, it seems, by his death, fallen into partial neglect; for he was the chief architect of the mechanism of algebra, and his almost singular felicity in separating the most striking and powerful parts from the rest, render his work very useful to the reader.

Bononcini passes for the translator of Bossuet's *History of Mathematics*, but a certain confidence in the *Gentleman's Magazine*, for 1821, p. 492, states, as of his own knowledge, that he only wrote the preface, and added the list of mathematicians at the end, the translation being by Mr. T. O. Churchill. His name however is prefixed to the work.

BONPLAND, a planter producing a kind of fever bark called Angoula. [Galipera.]

BONUS HENRICUS, a kind of weed, formerly supposed to possess medicinal properties. [Chenopodium.]

BONZES is the name by which the priests of Buddha are usually designated in Japan, and from whom the name in the Japanese language is bonzen, which word is supposed by Mr. B. H. Hodgson *Journal of the Royal Asiatic Soc.*, 1855, vol. ii., p. 293) to be a corruption of the Sanscrit bandya (vandya, 'laudable, deserving praise?') They go with their head entirely covered, either in the shape of kami-magor, or long-haired men. The highest in rank is the dairi, or spiritual sovereign of Japan, who resides at Mito. Till towards the conclusion of the twelfth century (A.D. 1185) the power of the dairi in Japan was nearly absolute; since then the supreme government has become vested in the dajogun, or secular commander-in-chief of the empire, and the influence of the dairi in temporal affairs is now next to none, though he still continues to enjoy the honours of a merely nominal sovereignty. (Taitting, *Iliad of Japan*). The province is divided and the counties are separated by F. Schaeber, *London, 1822*, 4to. pp. 3, 300, 301.)

The Bonzes are under a vow of celibacy, and form a large corporate body of male and female ecclesiastics. They are divided into two sects, hostile to each other, and externally distinguished by the coloring of their habits, the upper part of the body being in black and the other in grey. They maintain their influence chiefly by the popular belief in the efficacy of their intercession for others by prayer. Once in every fortnight they deliver a public religious discourse in the temples,
usually before numerous congregations. The Jesuit missionary, Gaspar Villa, who attended several public meetings of the higher classes of the preachers whom he heard, and of their impressive and dignified mode of delivery. Even the female Bonzes are said occasionally to preach.

The Japanese priesthood comprises individuals of all ranks of society, and the ranks of priests, the sons of kings, are known to have entered the order of Bonzes, but the majority belong to the lower and poorer classes. Many Bonzes earn their livelihood by superintending funerals. All claim it as the exclusive prerogative of their order to speak upon the religion of BuDdha, the doctrines of which they will not allow to be touched upon by any one else. The principal moral precepts which they inculcate are five, viz.—not to kill, not to steal, chastity, veracity, and abstinence from spirituous liquors.

The birds are common as well as for the female Bonzes, some of which have their own fixed annual revenues, while others are maintained by voluntary contributions from the people. The discipline enforced in these convents is described as rather strict. At different hours during the day the sounding of a bell summons the inmates to their common devotions. In the evening the prefect assigns to every one a special theme for his meditations. After midnight all assemble to sing hymns before the altar. Their meals take in common, and those who conform strictly to the rules get their portion of fish and flesh, as well as wine and all spirituous liquors. Some of the convents are said to contain large libraries.

There is a sect of Bonzes distinguished by the name Iko, the members of which are permitted to marry, but only those who have become familiar with the effects produced by the blows or shot of their persecutors. In the case of most other animals which, from not knowing his power, have suffered man to approach them to their destruction, alarm has been so often taken, the idea of danger has been so strongly associated with those safety has been sought in flight; but the wings of the booby are so long and its legs so short, that, when once at rest on level ground, the bird has great difficulty in bringing the former into action, and, when so surprised, will make no resistance to man, but put on a show of resistance with its beak, which is, to be sure, generally despised by the aggressor.

In the cases recorded by Bligh, the birds were probably fatigued by wandering too far from the rocky shores, which forms their ordinary haunts. They have been seen constantly on the wing over the waves which beat at the foot of the crags, intent on fishing. Though so well furnished with claws, they are said to swim but seldom, and never to dive. Their mode of taking their prey is by dash- ing down from on high with uncaring aim upon those fishes which frequent the surface, and instantly rising again into the air. They walk with difficulty, and, when at rest on land, their attitude is nearly vertical, and they lean on the stiff feathers of the tail, like the cormorants, as a third point of support. The ledges of rocks or cliffs covered with herbage are the places generally selected for the nest, and there, in great companies, they lay their eggs, each hen bird depositing from two to three. The young birds, for some days after their exclusion, are covered with a down so soft and thick, that they resemble powder puffs made of swan's down.

The boobies seldom wander more than twenty leagues from land, to which they usually return every evening, and their appearance is considered by mariners as a sure token of their vicinity to some island or coast.

**GANNETS OR BOOBIES OF WARM CLIMATES.**

The state of our information as to this division of the genus is by no means satisfactory; for the species are not well determined, and we may, by the example of the above alluded to, Sula fusca of Brisson, and others, Pelecanus Sula of Linnéaus, Le Pou brun of the French, the Booby of Sloane and Ray.

The colour of this species is blackish-brown or ashy-brown above and whitish beneath; the head and the naked skin about the face is reddish; the orbits and base of the bill are yellow, and the point of the bill is brown; the legs are of a straw colour.

In length the brown booby is about two feet five inches, the bill measured between the nostrils and a half inch or thereabout and the tail ten: the young birds are spotted with white and brown.

It is almost impossible to open the pages of the old voyagers who have fallen in with these boobies without finding some interesting accounts of their habits, of which the latter are subjected by the frigates or man-of-war birds. [FRIGATE] LESSON, indeed, doubts this. He says, 'the boobies have been so named because it has been supposed that the frigates compelled them to dispense with the fish which they had taken; but this appears to us to be
erroneous. The booby is warlike, he lives fearlessly near the frigate, and swallows the fish which he has captured in peace. Buffon, Cuvier, and Temminck, on the contrary, evidently give credence to the narratives of the frigate persecution, and indeed it is difficult to believe that so many eye-witnesses should be mistaken.

Peuliffe says, 'I have had the pleasure of seeing the frigates give chase to the boobies. When they return in bands towards evening from their fishing, the frigates are in waiting, and dashing upon them compel them all to cry for succour, as it were, and, in crying, to disgorge some of the fish which they are carrying to their young ones. Thus do the frigates profit by the fishing of the boobies, which they then leave to pursue their route.' Leguat, in his voyage, thus writes: 'The boobies come to repose at night upon the Island Rodriguez,* and the frigates, which are large birds, so called from their lightness and speed in sailing through the air, wait for the boobies every evening on the tops of the trees. They rise on the approach of the latter very high in the air and dash down upon them like a Falkon on his prey, not to kill them but to make them disgorge. The booby, struck in this manner by the frigate, gives up his fish, which the frigate catches in the air. The booby often shrieks and shows his unwillingness to abandon his prey, but the frigate mocks at his cries, and rising, dashes down upon him anew till he has compelled the booby to obey.' William Dampier observes that he remarked that the man-of-war birds and the boobies always left sentinel near their young ones, especially while the old birds were gone to sea on their fishing expeditions; and that there were a great number of sick or crippled man-of-war birds which appeared to be no longer in a state to go out for provision. They dwelt not with the rest of their species, and whether they were excluded from their society or had separated themselves voluntarily, they were dispersed in various places waiting apparently for an opportunity of pillage. He adds, that one day he saw more than twenty on one of the islands (the Alcanres), which from time to time made sorties to procure booty. The man-of-war bird that surprised a young booby without its guard gave it a great peck upon the back to make it disgorge (which it instantly did) a fish or two as big as one's wrist, which the old man-of-war bird quickly swallowed. He further speaks of the persecution of the parent boobies by the able-bodied frigates, and says that he himself saw a frigate fly right against a booby and with one blow of its bill make the booby give up a fish just swallowed, upon which the frigate darter with such energy that he seized it before it reached the water. Cocker and others mention similar occurrences. Nuttall says, 'the boobies have a domestic enemy more steady, though less sanguine in his persecutions, than man; this is the frigate pelican or man-of-war bird, who, with a keen eye desiring its humble vassal at a distance, pursues him obliquely down into the sea, and obliterates all its wings and bill to surrender his flabby prey, which the pirate instantly seizes and swallows.' * * * The booby utters a loud cry, something in sound betwixt that of the raven and the goose; and this quaking is heard more particularly when the birds are parading in the air, or, when assembled together, they happen to be seized by any sudden panic.'

Their nests, according to Dampier, are built in trees in the isle of Aves, though they have been observed in other places to nestle on the ground. They always associate in families in the trees. The young are covered with a very soft and white down. Nuttall says that they abound on rocky islets off the coast of Cayenne, and along the shores of New Spain and Caracas, as well as in Brazil and on the Bahamas, where they are said to be very numerous. In summers he adds, they are not uncommon on the coasts of the Southern States. The flesh he describes as black and unsavoury.

GANNETS OR BOOBIES OF COMPARATIVELY COLD CLIMATES.

The Gannet of the English; the Solan* Goose, or Solan-Goose, of the Scotch and English; Sula of the Fâroe Islands; Nannau of the Germans; and of the ancients, Canna or Canna are the only recorded names of this bird. The French call it the Pou de Bassan and Oie de Bassan; the Germans, the Solen-Gans, or Schollen-Gans; the Dutch, Zwaan of Gent; the Danes, Gans and Gann of the ancient British; Der Bassanische Pelikan of Bechstein; Wetzer Tolpeck of Meyer; La grande Pou and Le Pou tacheté of Buffon; Anser Bassanus of Sibbald, Gesner, and others; and Anser Scoticus, Sula Bassana, and Sula Maj or of Brisson; Sula Holmeri of Celsius; Sula alba of Meyer; Pelecanus Bassanus of Linnaeus; Pelecanus Bassar优us and Pelecanus fuscus of Gmelin; and Gannet Corvorni of Penn.

Its geographical distribution may be stated, as a general proposition, to be over the arctic regions of the old and new world, for it is one of those marines birds which is found on each side of the Atlantic, though in its migrations to the north it is said to have been seen plunging for sardines as low as the mouth of the Tagus. In Europe the strongholds of the solan-goose seem to be in Norway and the Hebrides. St. Kilda, and the Bass in the Firth of Forth, are favourite haunts. Pennant observed their northern migrations in Caithness, and say they were passing the whole day, in flocks of from five to fifteen each. They appear migratory on the shores of Holland, and are seen on the coast of Cornwall at the end of the summer, arriving with the pelican, and disappear with the terns. They are recorded according to Pennant; but Montagu observes that they have been frequently seen in the English Channel during the winter, and then as late as the month of April. In Ireland they breed, and are numerous; and they are occasionally seen in Greenland. Oddly enough, Pennant observed that they appear on the coasts of the United States, especially to the south of Cape Hatteras. On考察 the eastern coast of America, and the neighbouring coast they are seen in numbers in the month of October, associating with the velvet ducks and scoters. Bonaparte (Prince of Musignano) notes it as rare and occasional at Philadelphia.

To give the idea of the multitudes of these birds, we will select one or two accounts from the many that might be quoted. The surface of the Bass island, according to Dr. Harvey, is almost entirely covered in the months of May and June with their nests, eggs, and young; so that it is scarcely possible to walk without treading on them. When in flight they overshadow like clouds, and make such a stunning noise, that it is scarcely possible to bear your next neighbour. The sea all around is covered with them, and

* These may have been the species known in the island by the name of Gannen-bay, apparently referrible to Sula candida, Brisson, and Pelecanus Fis ciger, Linnaeus, Zoö, Præct. 1816, p. 39.
† Nuttall observes that these separatists were probably the males after incubation.
the flocks in the distance can only be compared to vast swarms of bees. Martin states that the inhabitants of the small island of St. Kilda consume annually upwards of 22,000 young birds of this species, in addition to an immense quantity of their eggs, which form their principal support.

The same author says that at the small isle of Boreas the hounds were capable of capturing and killing the geese, and their excrements were in such quantity, that they gave a tincture to the sea, and at the same time suffused the boat and clothes of the party. The Gannet Rock in the Bay of the St. Lawrence is about 400 feet in height, and of several acres in extent. In the last decade of June, according to Audubon, this rock was covered with innumerable gannets upon their nests, so crowded or closely arranged as to give the appearance of a huge mass of snow, while the hovering crowds seen around that inaccessible mass seem to be only occasionally presented at a distance the appearance of a snow-storm.

Before we enter into a description of the habits of the gannet, it may not be uninteresting to give a sketch of its organization, which is somewhat peculiar, and admirably adapted to promote the buoyancy of the bird and the rapidity of its descent on its prey. Montagu's observations on this part of its economy (the situation and connection of the air-cells, see Supplement to Ornithological Dictionary, article 'Gannet') are very interesting, but as the researches of this and many other descriptions from which we will be sufficient to refer to the former; and we proceed to give Mr. Owen's notes of the examination of a gannet that died in the garden of the Zoological Society of London in 1831. It will be seen, on reference to Montagu's statement, that the air-cell with which the animal is so abundantly supplied, the skin could not be artificially inflated through the lungs.***

*** It is also clear that there is no direct communication between the sides.

In the examination, writes Owen in the Proceedings of the Zoological Society, the body was opened directly from the head to the air-cells, which, in this bird, as in the pelican, have a most extensive distribution. We commenced by a gentle but continued inflation through the trachea, a pipe having been introduced into the upper larynx: in a short time the integuments of the whole of the lateral and inferior parts of the body exploded, and the integument of the body) especially that which is situated in front of the os foricinum. Being thus satisfied that they all had a free communication with the chest, we next proceeded to see at what points these communications took place, and in what degree the air-cells communicated with each other. For that purpose the air-cells on the left side of the body were laid open, and, shortly after, those of the opposite side collapsed, indicating the existence of apertures of communication, although the septum which ran along the middle line of the body appeared to be complete. Communication between the lateral air-cells of the same side of the body from the os foricinum to the side of the pelvis; but the air-cell in front of the os foricinum remained still tensely inflated. The lateral air-cells had a free communication with the cavity of the chest at the axilla, at which part the air had entered these cells during the inflation. The pectoral muscles and those of the thigh presented a singular appearance, being, as it were, cleanly dissected, having the air extended above and below them; the axillar and inguinal parts were likewise draped by any surrounding substance through these cavities. We traced the air-cells down the side of the humerus, ulna, and metacarpal bone, into all of which the air entered, and even into the bone corresponding to the first phalanx, which agrees with what was observed by the author (cf. Aeronaut, 1835, p. 92). As none of these proceedings had any effect on the air-cell in front of the os foricinum, which still continued distended, it was evident that inflation by the humerus could not have filled it except through the medium of the air-cells. We observed that the feathers of the integument from this air-cell to see its shape and extent: this required to be done with great care, as it adhered very closely to the skin and roots of the feathers; it was of a globular form, about four inches in diameter, and communicated with the pelage in such a manner that it could not be easily detached. Numerous strips of muscular fibres passed from various parts of the surface of the body, and were firmly

attached to the skin; a beautiful fan-shaped muscle was also spread over the external surface of the air-cell anterior to the os foricinum. The use of these muscles appeared to be to produce instantaneous expulsion of the air from these external cells, and by thus increasing the specific gravity of the bird, to enable it to descend with the rapidity necessary for the purpose of its living prey while swimming near the surface of the water.

This is a beautiful adaptation of means to an end. The descent of the bird on its prey has been not unaptly compared to that of an arrow, the beak of the bird forming the arrow-head, and the body and wings the feathered shaft of the weapon; we here have the secret of its heavy fall; the same machinery restores the buoyancy at the proper moment, and the bird rises with its fish aloft.

Some idea will be formed of the rate of the gannet's descent from the following note by Pennant:- 'About four years ago* one of these birds flying over Penzance (a thing that rarely happens), and seeing some pike-harls lying on a fl-panck in a cellar used for curing fish, darted itself down with such violence, that it struck its bill quite through the board (about an inch and a quarter thick) and broke its neck.' To this Pennant adds that these birds are sometimes taken at sea by a deception of the like kind. The fishermen fasten a pike-harld to a board and leave it floating, and the gannet is decoyed to strike its bill in it. The gannet has immortalized this mode of booby-catchings in those droll lines with which our readers are doubtless familiar.

There are some parts of Aristotle's description of his 

careßovóδεος (catacarrata) (Hist. Anim. ii. 17. i. 12.) that lent themselves to the writer's suggestion. Bochart and Michaelis both leave the question in doubt, and Cambus seems to the opinion that it is a gull (La-

urus Cataractarum, Linn.); but no gull precipitates itself into the sea with the violent plunges described by Aristotle (ix. 12.).

Pennant hints in the catacarrata of Juba (Pliny, x. 44) some characters of the gannet, but gives no more than its habits. Bochart and Michaelis both leave the question in doubt, and Cambus seems to the opinion that it is a gull (La-

urus Cataractarum, Linn.); but no gull precipitates itself into the sea with the violent plunges described by Aristotle (ix. 12.).

The bird hardly deserves the reputation which its alliance with the other seabirds has in some places procured for it. Its habits and its struggles for liberty show that the self-preserving instinct is as strong as in other birds except at the breeding-season when every other feeling seems to be merged in the ardour of incubation. Thus it has been stated that some of their number always keep watch at night, and that the sentinel, by varying his intonation, apprizes the flock of the approach of danger. The specimen sent by Dr. Borlase to Pennant was killed at Chantre, near Mountbay, but not till after a long struggle with a water-paniel, assisted by the boatmen, for it was strong and pugnacious. * The person who took it, adds the doctor, observed that it had a transparent membrane under the skin, with a globular mass of air beneath it, without obscuring the sight or shutting the eye; a grand provison for the security of the eyes so weighty a creature, whose method of taking its prey is by darting headlong on it from a height of a hundred and fifty feet or more into the water.

The organization above alluded to gives the gannet great buoyancy when swimming, and it swims high like a gull. When one which Montagu kept alive was placed on the water of a pond, nothing could induce it to attempt to dive; but Dr. Borlase, from the observation of its feeding habits, noticed that it was often seen diving, the whole head under water, as if searching for fish, it appeared to Montagu that the prey is frequently taken in this manner.

Withered grasses and sea-weeds, 'blessed by nature, a sun and shadow form the nest, which is placed on the ledges of the overhanging precipice, or in the fissures of the rock. Martin says that they frequently rob each other, and that one which had pilaged a nest flew out towards the sea with the spoil, and returned again as if it had digested the stomach of the new victim. A parent bird, though at a distance from his nest, had observed the robbery, and waited the return of the thief, which it attacked with the utmost fury. 'This bloody battle,' adds the narrator, 'was fought above our heads, and proved fatal to the parent, who fell into the sea, and our men took him up, and presently dressed and set him free.'

* From a note in the letter of Dr. Borlase, to whom it appears that Pennant was indebted for his communication, the time alluded to must have been about 1750.

* The gannets are possessed generally by fly coastwise.

* The cicatizating membrane. [Birds.]

No. 292.

[THE PENNY CYCLOPAEDIA]
The number of eggs are stated at one, two, or even three, if the two first laid are taken. Temminck gives two as the number, others three, where none have been abstracted. They are white, equally pointed at each end, rough on the surface, and less than those of a goose. These birds sit close together. It is said that the male and female hatch and fish by turns, and that the fisher comes back to the nest with five or six herring in its gorged, all entire and undigested, which the hatchet pulls out from the throat of its provider and swallows, making at the same time a loud noise.

The young birds are a favourite dish with the North Britons, and Pennant observes that, during the season they are constantly brought from the Bass Isle to Edinburgh, where they are sold roasted, and served up as a what. Our readers will remember that the relishing Solan goose, whose smell is so powerful that he is never cooked within doors, formed a part of Mr. Oldbuck's dinner, though the same in which the odoriferous offering was presented excited the antiquary's just indignation.

The proprietor of the Bass is said to derive a considerable profit by taking the young and sending them to market, and by an old Scottish law he has a right, it is said, to visit the neighbouring isles and drive away his wandering gannets to his own domain.

The variations in the plumage of the gannet are very great, and, as in the instances of many other birds, the changes have given rise to the record of species which have no foundation but the natural alteration in the feathers covering it.

Old birds at the age of three years. Summit of the head and occiput of a clear ochreous yellow. The rest of the plumage milk-white, with the exception of the quills and the bastard wing, which are black. Bill of an ash grey at the base, but white at the point. Naked membrane surrounding the eyes bluish, and that which forms the prolongation of the opening of the bill and extends to the middle of the throat, dusky blue. Iris yellow. Legs dusky, in front bluish-yellow (Temminck says clear green); connecting membrane of the forward toes very strong, and nearly as transparent as glass (Temminck says blackish). Nails white. Tail coniciform, or wedge-shaped. The two exterior quills have the end of the barbs truncated, according to Temminck. Length two feet seven to two feet nine inches. The female is less than the male.

Young, a few days after their exclusion from the egg. The covering is a white and lustrous down, making the nestlings look like powder puffs.

First year. All the plumage of the upper parts spotless, blackish-brown. Lower parts brown variegated with ash-colour. Male, naked or irises brown. Tail rounded.

One year old, or second moult. Head, neck, and breast of an ash brown, covered with small lanceolated white spots very closely approximated. Feathers of the back, rump, and wings of the same colour, and marked with similar tufts of the same, but much more condensed. Lower parts whitish, variegated with ash brown. Tail and quills brown. The first conical with white shafts. Bill ash brown, but whitish towards the point. Naked parts of a bluish-brown. Iris yellowish. Front of legs and upper part of toes greenish-brown. Membranes of an ash brown. Nails whitish.

Two years old, and during the moult. At this age the bird is already partly covered with white feathers, while the rest of the plumage is still brown and spotted with white. The young of the age of one and two years wear the title major of Britain, Pelagia matricula of Gmelin, Le Grand Pou and Le Pou tachét of Buffon, and the Great and Spotted Booby (the head of which is given by Catesby) of Latham.

BOOK-KEEPING. Book keeping is that art by which all the transactions of commerce are so methodically recorded as to exhibit a perfect picture of a merchant's affairs.

When we consider that property embarked in commerce is in a state of constant flux, by which it undergoes perpetual transformations, and reflect upon the intricate nature of many mercantile transactions, and the multifarious nature of joint adventures and foreign exchanges, we cannot hesitate to admire the ingenious though unknown contriver of a system which enables the merchant not only to register with clearness every fact touching his estate, but to ascertain with certainty all those facts whenever he chooses to collect them together.

As an art it is not easy to overrate its value. The wonder indeed is, that both in and out of trade there are any persons who are insensible to its importance. To every man engaged in business the utmost accuracy of accounts is essential, yet it is notorious that in this great trading community the practice of book-keeping, particularly among retailers, is extremely loose and unsatisfactory.

As an invention book-keeping is undoubtedly modern, being with great probability referred to the fifteenth century. Venice is said to be its birth-place, and the first known author was Lucas de Burgo, who published in 1493 a regular treatise in the Italian language. France, England, Italy, and Germany, have subsequently produced a great variety of works, all of which the true principle of an account down with sufficient perspicuity; but students in search of serviceable instruction should consult the most recent authors, who, being either practical men themselves, or in close communication with those who were so, have greatly simplified the plan of their predecessors, and by adopting successive expedients to the real exigencies of trade, have introduced a high degree of elegance and neatness into their methods, combining accuracy with expedition and brevity with clearness and completeness, which is the perfect perfection of the art.

In order to accomplish these objects, every event affecting the property must be recorded in such a manner as to show in the simplest form and with the utmost perspicuity all the essentials of each transaction, that is to say, the subject-matter of it, the date of its occurrence, the person on whose account and the person with whom it takes place, together with the mode of its performance.

It is evident that in very large concerns there must be always a tendency to intricacy and confusion, where concurrent operations are in constant progress, and circumstances of great variety are crowded into a short space of time. Malcolm, who published his New Treatise at Edinburgh in 1718, is therefore justified in declaring it to be a work of no small skill and labour to evolve out of this confusion the least statement which a perfect balance-sheeter presents. Yet it is in large concerns, generally speaking, that fulness and facility are to be found, because the conductors, strongly impressed with the ruinous consequences of obscurity, take effectual means to guard against it by maintaining an establishment and a system commensurate with the extent of their business. The principle of book-keeping is of such inflexible rigour, that it never admits of relaxation under any conceivable circumstances, although it
adapt itself with equal facility to every possible matter of account.

With regard to the particular plans which ought to be put in practice by individuals it would be vain to enter into minute directions, since every person engaged in trade is in some degree versed in book-keeping, and of affording a guide to them it may have occasion to construct a set of books for any particular undertaking.

The outline of the art of book-keeping may be conveniently sketched by the words 'Inwards,' 'Outwards,' 'On Hand.'

Everything brought into the concern, either at its origination or in subsequent dealings, is, of course, property 'Inwards,' but the generic term 'Property' must, in respect to book-keeping, be subdivided into as many species as the nature of the particular business requires. The broad subdivision is into Cash—Bills—Book-debts—Stock, and, in conformity with it, every regular house of business keeps a separate place for the registry of all its transactions under one or other of these heads.

That the phrase is perhaps in its frame, containing on the left-hand page separate spaces for the date—the person who has brought any cash 'Inwards,' and the exact sum, all ranged in a horizontal line. These sums are placed under one another, so as to be easily cast up in a column, at the end of which sum total column, a running balance is kept showing where the amount of each entry has been carried forward into another book to the credit of each payer respectively. On the right-hand page provision is made in the ruling for the same particulars, in the same arrangement, respecting each separate transaction. If a posting column also to shew where each entry has passed onward to the debit of the receiver.

Solomon, according to the city proverb, was a wise man and Sampson was a strong man, but neither could pay away money that he had never received. It follows as an unanswerable argument that the left-hand side of a cash-book, correctly kept, can never amount to a less sum than the right-hand side. The difference, if any, of the totals will so accurately point out the balance remaining on hand, that should any discrepancy appear, the book-keeper has, in that circumstance, a convincing proof of error, and instantly addresses himself to its discovery.

The cash-book being familiar to the generality of persons, is best fitted for exemplification, but, in truth, every account, when well kept, is equally simple and exhibits the very same phenomenon. Whether it be the left-hand side of the account in the book-keeping sense of the term, is a chronological collection of all the events by which the property of a concern has been affected by the person or thing in question, the events 'Inwards' being ranged on one side and contrasted with the events 'Outwards' on the other side. The book-keeper therefore historiographer of the property.

Bills, which form the second head of subdivision, are either receivable or payable, and each description requires a book to itself. They are upon the concern in directly opposite ways, bills receivable being one of the avenues through which debts are collected from the world, and bills payable being one of the channels through which the concern discharges its obligations. From this consideration it is easy to show that as a bill, when it has passed as a bill payable, appears as a bill receivable in the books of the party for whom he accepts it, and this circumstance elucidates the nature of book-keeping in general, since what is true of bills is equally true of all other transactions. The same indistinction takes place universally, so that if two men accurately record their mutual dealings their books must be counterparts of each other, exactly dovetailed at every point of their connexion. It sometimes happens that a man's own acceptance is remitted to him, in which case the events are as receivable and bill receivable. The bills receivable book should contain spaces for all particulars, both inherent and relative. Those inherent in the bill itself are,—the drawer—his residence—to whom payable—on whom drawn where payable—date—time—when due—amount. The relative or contingent particulars are,—when received from whom—on whose account—folio where credited in another book—when and to whom paid away—folio where debited in another book.

On the Continent it is customary with those who negotiate foreign bills to copy into their bill-book the names of all endorsers. With inland bills such minuteness is not necessary and, as a matter of fact, is almost universally neglected. The bills-payable book contains the same inherent particulars, except the name of the drawer, which is in fact the concern itself. The relative circumstances are also recorded, but in a reverse order, to correspond with the opposite character of the transaction. Both books are furnished with a column for a running series of numbers, written also on the face of each bill respectively, by which means it is pointedly referred to in subsequent entries, and readily identified when occasion arises.

Book-keeping makes a personal demand for which no acceptances have been given. The record of each sale being originally made in a sold day-book, with full particulars as to quantities and prices, the sum is carried forward into a ledger to the debit of the buyers, who are respectively charged under their names with the value delivered to them, each account having a distinct folio or division to itself. This constitutes a list of 'debts receivable,' and is called the sold ledger.

The bought ledger, on the contrary, exhibits a list of 'debts payable.' This ledger is under the names of persons from whom goods have been received into the concern, and is founded upon entries, with full particulars, in a book kept for the purpose called 'invoices inwards,' or 'bought day-book.

The remaining subdivision is stock, a term loosely employed, sometimes to signify all the property possessed by a concern and sometimes the surplus property—more strictly called capital—in the concern, after deducting every obligation. Its more definite sense is limited to goods of all descriptions having been manufactured or acquired. With regard to stock, it cannot be denied that its comings and goings are exactly as much entitled to a regular record as any other portion of the property, since that which is stock to-day may become book-debt to-morrow. Stock-receivable is the title given to the case, in which the course of time form part of the balance at the banker's. There can be no reason whatever why the banker's account, the bills receivable, and the sold ledger, should be carefully kept, which does not apply with equal force to the stock account. The method here adopted of giving a summary of the entire range of book-keeping, is simple. Each description of goods, bought or made, should have a piece of its own, either a book or a page as the case may require, for an accurate register of the dates and quantities 'inwards,' or 'outwards,' whether they are purchased or manufactured, enter the denominations 'inwards' or 'outwards,' whether the delivery 'outwards' take place to a buyer or only from one department to another within the concern. For example, in a brewery the account of malt should show the quantity deposited in the malt-room compared with the quantity withdrawn from the same department to give the balance of malt on hand by deducting the smaller from the larger total, exactly as in the instance of the cash-book.

One of the fundamental and indispensable laws in perfect book-keeping is that every account must be specific. When the account is with persons, the discharge answers in value to the charge; but when the account is of things the discharge must answer in kind.

Thus if a brewer receives inwards 1000 quarters of malt his books show that he has received 1000 quarters of malt, and that he accounts to the next man as such. But it follows from this how that quantity was disposed of. By charging to the buyers the quantity resold, and charging to the account of his own mash-tub the quantity actually put into it, he gives himself the means, and the only means, of knowing whether he has had the full benefit of all his malt; and if he finds a deficiency, he can instantly address himself to the discovery of the cause, just as he would have done if his cash had been deficient.

There is one miscellaneous error in some of the more ancient treatises on book-keeping, and that is the assumption that the youthful student should be effectually guarded. It is sometimes stated that among the devices of book-keeping imaginary accounts are raised. Nothing can be further from the truth. The book-keeper, if he understands his duty and adheres to it, knows well that the imaginaries would be altogether out of place, and plods his way from fact to fact, with painstaking perseverance, using his utmost
care to prevent the admission of whatever is false, and the omission of any fact bearing upon the property.

It is customary, even in modern treaties intended for the use of schools, to divide book-keeping into two kinds, under the names of double and single. The fallacious representation of so important a subject cannot be too speedily explicated, as there is reason to think that the absence of system, so prevalent in the book-keeping of retail traders and professional men, may be ascribed to this original vice in their education.

There is this in common between the two, that the transactions, as they occur in business, may be primarily registered in the same way by both methods—that is to say—single entry has its cash-book, its bill-book, its day-book, and its ledger, for personal accounts; but even in these, it is completely the caprice of the book-keeper free from the control of principle, that matters the most distinct in their nature are frequently jumbled together, bills receivable and stock being confused with cash, and the day-book being projected, from its only proper purpose, into a receptacle for all sorts of incongruous transactions.

But here the similarity ends, and here begins the superiority in power and beauty of double entry, historically called the Italian method.

The method, grounded itself upon the scientific axiom that "the whole is equal to the sum of all its parts," is satisfied with nothing less than a perfect equilibrium between the total amount of all the debtor accounts on one side, compared with the total amount of all the creditor accounts on the other. On this principle, at this ultimate, the bookkeeper by examining, at every step of its progress, the same equilibrium between debtor and creditor in each entry; and by suffering no event either inwards, internal, or outwards, to take place without a self-balancing entry, it secures at last its great object of painting a perfect picture of what is going on when all these separate parts are collected together as a whole.

It effects this purpose by resorting to every original entry, that whether that entry relates to the delivery of goods inwards or outwards, or to cash, or to bills, or to wages, salaries, bounties, fees, or any other item, or to any of the numerous labours of body or mind which constitute the ground of debt from one man to another. For these original entries too many treaties unskilfully refer the learner to one general waste-book; but the true theory of a waste-book is, that it is that book where the first entry of a fact is made in the handwriting of the person who was cognizant of that fact; and to preserve the chain of responsibility unbroken throughout any establishment, it is an excellent regulation to make each person answerable, by means of his own particular accurate account, for whatever he does in his own department. In this corrected view, the cash-book is the waste-book for cash, the bill-book is the waste-book for bills, the day-book is the waste-book for goods, and so on through all the original books.

A double entry gives the original particulars are digested into various heads of account, without the omission of a single event.

The act of digesting these original entries is technically called journalizing, because they are collected together in a book called The Journal, where they for the first time put off their individuality, and are massed together according to some rule of affinity previously established in the mind of the book-keeper, who is held to this indispensable condition, that he must raise exactly as much matter of account to the debit as to the credit.

The distinction between single and double entry becomes apparent in the different ways in which they dispose of the very same facts. Thus, suppose the book-keeper by double entry to be occupied with the invoices inwards, and to find that since he made his last Journal entry from that book, his employer has contracted debts amounting in the whole to 3690l. 18s. 4d. By the contrivance of journalizing, the book-keeper not only states this total, and assigns the amount due to each creditor, but he charges also the accounts to and from, as a matter of course, in each instance the particular reason why each debt has been contracted, and charging the amount of it to that reason; or, in other words, he considers the sources from which his employers must seek a return of their outlay, and charges them in the ledger as such.

To avoid multiplicity, let us suppose three causes to have given rise to this amount of debt, and these three causes to have been the purchase of Iron, the repair of Premises, and the supply of provender to the Stables. It is evident that each of these causes differs from the other two in its nature, and at the annual summing up it is of great importance to distinguish them in the accounts. The first cause is the purchase of an article for manufacture. The second is a permanent addition to the cost and value of the place. The third is one of the expenses of trade. Double entry requires and provides for the statement of this important distinction. Single entry indifferently or ignorantly satisfies itself with adding to the personal credit of the parties the amounts respectively due to them, omitting altogether a separate record of the reason why the debts were contracted, and thus shutting out some of the most interesting points of information.

According to the customary mode of book-keeping by double entry, the supposed facts would take the following form in the journal, the word 'sundry' being an abbreviation for 'sundry accounts:'

<table>
<thead>
<tr>
<th>Iron</th>
<th>3690l. 18s. 4d</th>
<th>Dr. to sundries</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jones &amp; Co.</td>
<td>1250</td>
<td>Dr. to sundries</td>
</tr>
<tr>
<td>Smith &amp; Co.</td>
<td>500</td>
<td>Dr. to sundries</td>
</tr>
<tr>
<td>Thompson &amp; Co.</td>
<td>2450</td>
<td>Dr. to sundries</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Premises</th>
<th>1250</th>
<th>Dr. to Carpenter &amp; Co.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill for repairs</td>
<td>450</td>
<td></td>
</tr>
<tr>
<td>Stable</td>
<td>1250</td>
<td>Dr. to Chandler &amp; Co.</td>
</tr>
<tr>
<td>Bill for hay &amp; straw, etc.</td>
<td>850</td>
<td></td>
</tr>
</tbody>
</table>

These journal entries are then carried forward to the ledger, where not only the personal accounts are credited, but the impersonal accounts are debited. Turning to the balance sheet of this company, the bookkeeper finds the folio appropriated to all transactions in Iron to be, perhaps, 29—the Premises account to be at folio 36, and the Stable account at 16.

He accordingly opens folio 29 in his ledger, where he had previously written the word 'Iron' in large characters at the top of the page, and annexing the proper date, posts the sum of 3174l. 15s. to the debit of that account, and refers in a column ruled for that purpose to the page of the journal. He then looks to his index for the accounts of Jones & Co., Smith & Co., and Thompson & Co.; or if there had been no previous dealings with them, he opens an account with each of these parties on separate pages of his ledger, and posts to their credit the several sums which he finds in the journal, carefully stating in his ledger the page in the journal where the entry came from, and in the journal the folio of the ledger where the entry is gone to, in conformity with an irreversible rule that no entry should, in any instance, be carried forward from book to book, without a distinct reference in each book to the page of the other.

After posting the three supposed journal entries, the ledger will exhibit the same facts in a new form.

The attentive reader will have taken notice that the iron purchased of Thompson & Co. on the 24th of the month is journalized in the same entry with the iron purchased twenty-three days before, from Jones & Co., and will infer that in many instances in book business, such a delay might be highly inconvenient, especially in cash and bills. Such an inference is quite correct, and the only pretext that can be alleged for persisting in single entry is, that it carries
the events directly from the original books into the ledger without the dilatory intervention of a journal.

The writer of this article has for many years been in the habit of employing a method which combines the quickness of single entry, as it regards the personal accounts, with the satisfaction of double entry, as it regards the general books of the company. He considers this 'combined method' well worthy of the attention of all who either as principals or book-keepers are interested in the accounts of any extensive business. By the method here alluded to a summary ledger is kept, and this is the only ledger that has a journal attached to it. These two books, namely the summary journal and summary ledger, are devoted exclusively to the personal accounts, together with the bank's, travel's, and other personal accounts of that nature. The records are collected into the journal from the subsidiary books in convenient periods, whether weekly, fortnightly, or monthly. According to this method the debits contracted, by the supposition above, for Iron, Premises, and Stable, would be placed respectively to the credit of the parties in the bought ledger, as soon as the accounts could be examined and passed.

On the other hand, every payment made against the purchases, whether by cash, by bills receivable, or by bills payable, would be charged to the proper personal account in the bought ledger at the very moment of making the payment. The bought ledger would, therefore, in all respects exhibit the state of every account it contains, and may be referred to at any time, with the certainty of finding the last event recorded. This is the advantage of single entry, that there is no journal to obstruct the progress of the record, and that the accounts are kept at all times in the proper state, and appears without delay in its proper place, namely the personal account to which it relates.

The summary journal, in registering these same purchases, throws away all consideration of particular persons, and neither the clerks of reference, by raising a single account comprehending them all under the general name of 'bought ledger,' thus:

<table>
<thead>
<tr>
<th>Dr. to Bought Ledger</th>
<th>Credit</th>
<th>Dr. to Bought Ledger</th>
<th>Credit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jones</td>
<td>200 lots</td>
<td>5 0 0 0 1000 0 0</td>
<td>Smith</td>
</tr>
<tr>
<td>Thomson</td>
<td>14 0 0</td>
<td>5 0 0 0 707 0 0</td>
<td></td>
</tr>
</tbody>
</table>

Upon the face of this balance-sheet, double entry speaks at once to the eye, and informs the parties to the account not only of the amount of debt incurred, but the means of discharging it, by showing the property divided into proportions of salable (Iron), mortgageable (Premises), and consumable (Stable); thus distinguishing the effects into those which are more or less available and those which are unavailable for the discharge of immediate obligations.

If a short series of pro forma suppositions is added to the above, the value of the balance-sheet will be more distinctly seen in the strong and steady light it sheds upon the vital question of price.

Suppose, then, that the conductor of the business has sold out 4000l. consols at 92 1/4 less brokerage—that he has paid the proceeds directly into his bank's hands for the use of the business—that he has effected sales of 550 tons of iron at 7l. 10s. 0d., and has, by the same means, purchased 600 slabs of wood at 7s. 6d.—then he has received out of these accounts cash to the amount of 750l. 16s., and 18 bills, amounting to 2323l. 12s., besides allowing 12l. 12s. in abatements and discount—that out of these cash receipts he has paid taxes 22l. 10s., other charges to the amount of 25l. 16s., and bank interest 60l.—that he has settled Chandler and Co.'s demand by a cheque on his bankers for 63l. 14s., abating 10d.—that he has drawn checks for salaries and other charges to the amount of 51l. 7s. 6d.—then he has accepted a bill addressed to his bankers at 2 months to Jones and Co. for 60l., deducting 24 per cent. in discharge of their demand—that he has accepted a bill (No. 2) at 6 months to Smith and Co. 1257l. 16s., and another bill (No. 3) at the same date to Carpenter and Co. 452l. 8s. 6d.—that the bill accepted at 2 months have fallen due and been regularly paid by the bankers, and that the two acceptances at 6 months are still running—that he has compromised a debt of 14l. 6d. for 106 in the pound, which he received in cash, forming the account of 3l. 4l. of 750l. 16s., and that further that of the 18 bills receivable, No. 8 had fallen due and been received in cash, value 8l. 14s., and that six others, namely, 1, 4, 5, 12, 13, 16, amounting to 89l. 17s. 4d., had short notice. The banker's, had fallen due and been regularly taken up in full by the acceptor, except Mr. All- swen, who, requiring the assistance of 551l., had 251l. lent to him out of the cash, and a bill receivable (No. 7) for 30l. Suppose also a horse to be bought, by check 33l. The original entries recording the above transactions would be made as follows:—The sale of the consols and disposal of the proceeds would first appear in the summary journal—the sales of iron would be stated with particulars of date, person, quantity, and price in the sales day-book, according to the order in which the sales are carried forward into the sold ledger, according to the division of persons. The cash-book would show in the order of time the various sums received from the particular buyers, whose accounts would be immediately credited in the sold ledger. The bills payable book would show in its ultimate entries both the names of the buyers from whom each bill had been received, and show the page in the sold ledger where it had been carried to his credit. With regard to abatements and discounts, the sold ledger and the bought ledger should each have a sufficient number of folios set apart to contain a list of all such allowances regularly recorded at the time of their occurrence; and these allowances, under the names of 'discounts outwards' and 'discounts inwards,' should be journalized at convenient periods in the summary journal. The bills payable book would show the date and amount of each acceptance, with a reference to the folio in the bought ledger where each drawer has been debited.
These transactions, when digested in the journal, would give rise to entries of the following effect:—

- Bankers, £500, less Brokerage.
- Sold Ledger.
- Amount sold as per Day Book, page 1 to 23.
- 550 Tons.

Cash
- Sold Ledger, as per Cash Book.
- £495 0 0
- BILLS PAYABLE, No. 8.
- £76 17 0
- £767 10 0

BILLS PAYABLE
- £475 4 6
- £670 0 0
- £69 10 0
- £86 8 6
- £16 7 0
- £283 11 9

BILLS PAYABLE—Chandler & Co.
- £33 0 0
- £58 17 9

BILLS PAYABLE—Johnson & Co.
- £25 0 0
- £250 0 0

When these entries have been properly posted in the summary ledger, and added to the accounts already there of
- Premises, Iron, Stable, and Bought Ledger, the general effect will come out in the following balances:

| Bankers | £5617 6 6 |
| Cash | £41 4 6 |
| Bills receivable | £1255 6 6 |
| Sold Ledger | £199 2 9 |

| Iron | £127 5 6 |
| Precious | £455 4 6 |
| Stable | £63 14 10 |
| Horse | £25 0 0 |

| Taxes | £95 10 0 |
| Charges | £84 13 9 |
| Discount outw. | £18 13 9 |
| Bad debts | £14 7 0 |
| £994 15 10 | £994 15 10 |

| Profit and Loss.
| Bankers | £495 0 0 |
| Bills payable | £575 0 0 |
| Cash | £500 0 0 |
| Depositable | £750 0 0 |
| Stable | £500 0 0 |
| Horse | £500 0 0 |
| £495 0 0 | £1000 0 0 |

| Profit and Loss.
| Taxes | £320 0 0 |
| Discount | £12 10 0 |
| Bad debts | £14 7 0 |
| £475 0 0 |

Should a stock-taking be determined upon at this point, the book-keeper, grounding himself upon his balance-sheet, transfers to an account of 'profit and loss' all those balances which represent absolute loss or absolute gain, independently of existing property, because they are matters of mere account, and not of matters of opinion. Under the supposed state of things, he would therefore of his own accord make the following entries in his journal:—

| Profit and Loss.
| Bankers | £565 7 6 |
| Cash | £41 4 6 |
| Bills payable | £1255 6 6 |
| Sold Ledger | £199 2 9 |

| Iron | £127 5 6 |
| Precious | £455 4 6 |
| Stable | £63 14 10 |
| Horse | £25 0 0 |

| Taxes | £95 10 0 |
| Charges | £84 13 9 |
| Discount outw. | £18 13 9 |
| Bad debts | £14 7 0 |
| £994 15 10 | £994 15 10 |

| Discount in.
| Balance of discount in. | £475 0 0 |

The balance-sheet being presented to the employer in the improved state thus produced, is examined, item by item, to ascertain that the property mentioned in the ledger is in actual existence. The cash, the bills payable and receivable, and the balance at the banker's, are disposed of in a few minutes, in all concerns which have the least pretension to regularity of accounts. The sold ledger and bought ledger ought to be thoroughly investigated, and the balance, if any, appearing in the summary ledger, ought to be sustained and elucidated by a schedule of the debts composing that balance, not only for the sake of proving that so much property really exists in the sold, and that all the demands have been discharged from the bought, but also for the purpose of proving to the propounder the specy collection of those debts which may have fallen behind in point of time. With regard to iron, it would be seen by the ledger that 651 tons had been bought and 550 tons had been sold. There ought, therefore, to be 101 tons on hand;—more or less than cannot be without either errors or fraud. After satisfactory proof of the fact, a valuation may be made, either at the market price or the cost price, according to the purpose intended by the stock-taking, which is sometimes to pay out the share of a deceased or retiring partner, sometimes to admit a new one, and sometimes in salutary compliance with an annual custom. Suppose in this case the valuation to be £5 p. ton, the consequence would be the following journal entry:

| Iron.
| Profit and Loss.
| Dr. to Profit and Loss.
| £505 0 0 |
| Loss. Balance of iron account in Ledger 16 5 0 |

£499 15 0

Suppose the consols were sold out half a year before, and consequently a dividend due; suppose, also, the value of provender in the stable to be 21/. 8s. 6d.; the horse to be considered one-seventh less valuable than when he was bought, and the premises to have undergone a deterioration of 10 per cent, these matters would be thus recorded in the journal:

| Profit and Loss.
| Dr. to Surplus.
| £505 0 0 |
| Balance Ledger. |

| £35 0 0 |
| £35 0 0 |
| £409 8 6 |
| £407 0 0 |
| £45 6 4 |

Consols.
- Half Year's Dividend due on £4000
- £215 14 9

£215 14 9

The effect of all these entries, when posted in the ledger, appears in a new balance-sheet, which now presents the actual state of the concern, with every account in the ledger adjusted to the same moment of time; for the book-keeper who does not, on these occasions, refer every account to the same moment of time discover that sort of ignorance in his art which Hogarth exposes and satirizes, for the benefit of other artists, in his celebrated picture of 'False Perspective.'

| NEW BALANCE-SHEET.
| Bankers | £3661 7 7 |
| Cash | £41 4 6 |
| Bills payable | £1255 6 6 |
| Cash at bank | £193 0 0 |
| £3197 5 6 |
| £3197 5 6 |
| £3197 5 6 |
| £3197 5 6 |
| £3197 5 6 |

| Iron | £500 0 0 |
| Precious | £500 0 0 |
| Stable | £500 0 0 |
| Horse | £500 0 0 |

| £500 0 0 |
| £500 0 0 |
| £500 0 0 |
| £500 0 0 |
| £500 0 0 |

The proprietor of the concern, with these authentic data before him, easily collects together all the accounts which are similar in their nature, and draws from the result the most useful practical inferences. Thus, he finds that in cash and cash-like accounts he possesses a Property of £1917 5 6

Out of which his bills payable will require 2174 15 0

To which he adds his horse | £500 0 0 |

£3661 7 7

And finds a free disposable fund of £3527 10 6

Having thus marshalled the floating against the floating accounts, he compares the fixed with the fixed, and finds the profits, horse, and stable to constitute a Total of £158 8 6

£158 8 6

more or less unavailable, from which deducting The Profit | £230 19 0 |

for which he is his own creditor, he adds The Difference | £227 9 6 |

to the above disposable fund | £3527 10 6 |

£3527 10 6

and perceives that if the price of consols is the same as when he sold them out, he can replace them, together with the dividend, even although his premises, horse, and provender should yield him only 227 l. 9s. 6d. If he continues in business, he periodically extracts from his books the same sort of information, and by comparing the results in the same way ascertain the progress he has made in a given time. In this case the means of living are supposed to be derived from sources independent of the business. If the proprietor had drawn any money for private purposes, he
would have been charged with it in a separate account under his own name.

So, where several partners are interested in any undertaking, the books are kept as if they were the books of one individual, with each partner being debited or credited in his personal account, and the book is adjusted each day, or brings inwards. At the stock-taking the account of profit and loss is balanced by transferring to the private account of each partner his respective share.

In the new balance-sheet, the reader will have remarked that, in place of each account representing the concern itself under different aspects, the debtor side forming an inventory of property so digested as to show at once what and where the several heads of property are, the creditor side exhibiting the nature and amount of the demands upon and liabilities of the concern, the total payable, for example, shows the amount which the concern is bound to provide for the satisfaction of claims which will be brought against it for actual payment; the account of consols shows the sum of money which the proprietor has embarked in this particular undertaking; and the account of profit and loss points out the amount of advantage he has derived from his transactions, provided all the accounts on the debtor side should realize the sums standing against them.

Another view suggested by this analysis of the new balance-sheet is, that although it may seem at first sight indifferent whether a man is his own debtor or his own creditor, since, in either case, he has no actual payment to provide for; yet in reality it makes an important difference to a man as a commercial being, whether or not he is, by the increase of profit and loss standing at the debtor or creditor side of his balance-sheet; since on the debtor side it indicates the absence or destruction of propriety, and on the credit side it indicates the absence or destruction of obligation.

This is in the strict sense a very strong view, for it is for profit that the labours, cares, and hazards of trade are encountered, and in books well kept the issue of the struggle is pointed out by this account of profit and loss. In the progress of the business sketched above more profits would accure, and would be recorded to the credit side of that account, but at the same time expenses and other outgoings upon the property would likewise be going forward, and would ultimately array themselves under the several heads for which the concern would be its own debtor. The important question is on which side the preponderance shows itself.

At this point it may be advisable to admonish the young accountant not to be led away by a sophism which will frequently assail him, viz., that whether he keeps his books by one method or another the result is the same. Whoever would be a success in business must understand that it is not only to ascertain the actual state of a concern, but to know what that state ought to be in virtue of all its transactions, that will immediately see the impossibility of arriving at that complete knowledge by single entry. One example will render this clear. Suppose that throughout the year the credit would be found as heavy by single as by double entry, but it is by double entry alone that you can ascertain whether that quantity is the right one. If you wish for satisfaction, as you naturally must, on so interesting a point, double entry gives you at once, and with what satisfaction, of course, that satisfaction which single entry drives you to obtain through the laborious "uncertain process of picking out," carrying within itself no principle of certainty, and harassing the mind with the consciousness of perpetual liability to error. Single entry is in fact a mere summary, and is therefore an insufficient and unreliable index as far as they go, but so incomplete and disjointed, that they throw no useful light upon the past progress of affairs, and are utterly incapable of showing what the present facts ought to be.

Double entry is of quite a different character. It begins, proceeds, and ends in as much certainty as human fallibility admits of. Whatever may become of the property in a concern, the matter of account is subject to no possible diminution. Not a single atom can be admitted into its calculation, the credit which is due to the sale of goods on account of the credit of one and to the debit of the other. Not an atom within the sphere can change its character, as, for instance, when a bill receivable is paid in cash, without producing a credit in the account it has abandoned, and a debit of equal value in the account it has entered.

BOOM, a commune in the province of Antwerp, ten miles south of Antwerp, with which it communicates by means of a paved road. The town stands on the banks of the navigable river Rupel; it contains 1045 houses and 6223 inhabitants. A considerable trade is carried on between this place and Antwerp, Mechlin, and Brüssel, which is much facilitated by the navigation of the Rupel and the Maas, both of which rivers empty into the town.

Great numbers of bricks and tiles are made here; the building of vessels for river and canal navigation is also carried on; there are two large salt-refineries and seventeen breweries, besides distilleries, rope-walks, tanneries, and establishments for flour manufacture. The town supports two communal schools, in which sixty-five boys and eighty girls are taught. (Die. Geog. de la Prov. d'Anvers, par Van der Maelen.)

BOONDE, a municipality in the S.E. quarter of Rajputana, under the protection of the Anglo-Indian government, between which and the Rajah of Boondee, Bishen Sing Behauler, a treaty was concluded in February, 1818.

The territory of Boondee formerly comprehended the petty state of Kotaah, and with it occupied that division of the province of Ajmeer (Rajputana) which is known as Harrasootee or Haravati, a name derived from the ruling family, who are of the Hans tribe. The boundaries of Boondee are Kotaah on the S. and E., the frontier being about five miles from the village of Gumbeehool; Jeypour and Onjara on the N., and Jajghur on the W.

The Rajah of Boondee having brought upon himself the enmity of the Maharattee chiefs, Holkar and Scindia, in consequence of the aid afforded by him to the British army during the late war with the French, he was expelled by them from the greater part of the territory and more than one-half of the revenues of the principality were exacted by those chiefs in the name of tribute. The subsequent success of its operations against Holkar and Scindia having enabled the British government not to insist upon a restoration of the province to its former extent, but the portion which was paid to Holkar by the Rajah of Boondee was remitted to the latter, together with certain pargannes, of which Holkar had taken possession. By another article of the treaty of 1818 the Rajah of Boondee was induced to sell certain lands at a low price to a company of English investors, amounting to 1,37,000 rupees (9000L. per annum). In addition to the pecuniary relief thus afforded to the Rajah, he received, under this treaty, an accession of territory to the extent of 2300 sq. m., including the town of Petam. (Rajputana.)

(Mill's Brit. India; Report of Committee of House of Commons on Affairs of India, 1833, political section.)

BOONDEE, the capital, in 25° 28' N. lat. and 75° 42' E. long. Properly speaking, the town consists of two parts, the old and the new. The former is built round a large square, which, on the north side, opens into the principal street of the town, which is to the W. of the modern buildings, is nearly deserted by the inhabitants, and for the most part in ruins: it contains however some fine pagodas, and some fountains. The new town is inclosed by high stone walls and connected with the old above mentioned by a fine broad road commanding it. The greater part of the houses are built of stone, and are two stories high. The principal street has a very striking appearance. At one end stands an extensive temple, dedicated to Krishna, covered with groups of elephants, and at the other end the great palace of the Rajah, built on the side of the hill: the intermediate space is occupied by two rows of shops fantastically ornamented.

At the lower end of the street and near the temple are figures of the natural size, cut in stone, of a horse and an elephant—those of the former being the more remarkable.

On the N.E. side of the city is a lake which is supplied with water during the rainy season by another great lake artificially formed by embankments on the high ground. The pass through the hills to the N. of the city is more than 6 m. long, and at three spots is defended by barriers. Near to one of these barriers is a summer residence of the Rajah, and some Hindu temples. Adjoining the second barrier is the cemetery of the Rajah's family, containing many highly ornamented tombs, with figures of elephants and war-horses. (Hodgson, in J. As. Soc., vol. iii.)

BO'OPS, a genus of fishes of the order Scaphopodottii, and, according to Cuvier's arrangement, belonging to the fourth family of that tribe called sparidii or sparids.

This genus is chiefly characterized by the species possessing trenchant teeth; the mouth is small and not protractile. The species are generally of brilliant colouring. Most of them occur in the Mediterranean.
Boo salpa (Sparsus salpa of Linnaeus) is of an oblong-ovate form: the ground colour of its body is bluish, which are several longitudinal yellow stripes.

This city is the largest and most important in the country, and is the capital of the province of Candeish, on the N.W. bank of the Tuptee River, 29° 19' N. lat. and 76° 15' E. long.

This city is one of the best built in the southern part of Hindustan; the houses are generally constructed of brick, and occasionally of stone. The streets are wide, and paved with stone; the market-place is a large and substantial building, but the city is without architectural ornament. The principal mosque is the only building which is an exception to this remark. It is of gray stone, with a large number of domes and minarets. The city has a handsome minar of an octagonal form: in front are a fine terrace and a reservoir of water.

Boorhanpore, which had been the seat of government for the Soubr or Viceroyalty of Candeish by Aungzebe, was taken, together with the rest of the Soubr, by the Maharattas, about 1769. In October, 1803, shortly after the battle of Assaye, this city was taken by a detachment of the army under General Wellesley, but was restored to the Maharajah, Dowlut Rood Scindia, on the conclusion of peace in the month of December in the same year, and the city has since continued subject to his government.

The principal commerce of the place is carried on by a peculiar sect of Mohammedans, known as Bobrah, but who call themselves Khans and are descendants from one Renza, son of Mohammed, who lived in the age immediately succeeding that of the prophet. These people, to judge from their personal appearance, are of Arab origin, and they adhere to the Arabian costume; many of them are very wealthy, and inhabit the city. The mosque and cemetery are about two miles from Boorhanpore.

The Tuptee is here a narrow river, and fordable in the dry season. Water for the supply of the city is brought by means of an aqueduct from a distance of 4 m., and is plentifully distributed over every street. The gardens, which grow abundantly in the neighbourhood of the city, are said to be the finest in India.

Boorhanpore is distant from Osjein 154 m., from Bombay 240, from Nagpoor 255, from Poona 285, from Agra 505, and from Calcutta 573 m., travelling distances.

(Mill's Brit. Ind.; Hamilton's Est. Ind. Gaz.)

BOORO, an island in the Eastern seas, situated between the S. E. coast of Celebes and Amboyna, between 3° and 4° S. lat. and 126° and 127° E. long.

This island is of an oval shape; its length from E. to W. is 25 m., and its average breadth about 40 miles. The inhabitants of the coast, who are Mohammedans, acknowledge the authority of the Dutch settlers, but are governed immediately by their own chiefs, or orang capos. The inhabitants of the interior, which is thickly forested, and is composed of the aboriginal Horsford, do not intermarry with the orang capos, and subsist upon wild fruits and the produce of the chase.

The south side of the island was formerly much infested by the Papuas, and was in consequence deserted by the natives.

At Cajilli or Booro bay, at the N. E. end of the island, is Fort Defiance, the settlement of the Dutch. This part is frequented by South Sea whalers for shelter during the monsoons, as well as to obtain wood and water, which are plentiful. The principal productions are rice, sago, and various kinds of dye and aromatic woods, for which many Chinese boats are frequent. The export of lac, and the collection of naphtha, is a native of Booro, and its product, known in Europe as Cajput oil, may be obtained in considerable quantity.

Stavrovius' Voyages, vol. 1; Forrest's Voyage to New Guinea; Porter's Tropical Agriculturist.

BOOTAN, or BHootAN, a name formerly employed to designate an indefinite tract of country to the N. E. of Hindustan, is at present limited to the Alpine region, which extends from the banks of the river Teesta eastward, and terminates to the N. of Assam, as it is supposed, at least 100 miles. As the width of the country is about 86° 40', the length of the country may be 150 miles, or nearly so. Its extent from N. to S. is only about 100 miles, and is supposed to be included between the parallels of 28° 30' and 28°. Thus, Bootan would occupy an area of 2000 square miles, that of Sikkim.

It is bounded on the W. by the territories of the Raja of Sikkim, on the N. by Tibet, and on the S. by Bengal and Bahar; but we are not informed what people inhabit the country along its eastern borders, and it is only conjectured that they are the Ankas or Akas, a nation which possesses the mountains N. of Assam, and is otherwise little known.

The extensive plains which occupy the southern regions of Central Asia, and are known as the table-land of Tibet, are situated at a great elevation above the sea. There are good reasons for supposing that on an average this elevation is between 7000 and 8000 feet. The distance between this table-land and the low plains on the banks of the Ganges, hardly exceeds in a straight line eighty miles, and as these low plains, where they approach nearest the table-land, are hardly 300 feet above the sea, it is easily conceived that the descent from the table-land to the low plain is so steep as to be exceedingly rapid and uneven. Bootan occupies the whole of this descent and a narrow tract of country at the foot of it.

As far as our information goes, the surface of Bootan is covered with numerous masses of rock, many of which rise to a considerable height. Between the mountains the valleys, which are extremely narrow, extend south and north, or nearly so, and are traversed by rivers, which, for many miles, are a succession of cataracts and rapids. Few parts however of this country exhibit different physical features.

Recent observation has shown that elevated plains are generally, if not always, bounded by high lands, which rise considerably above the level of the plains, and it would appear as if in all cases the mountain chains of the Arabian desert, or the Caspian shores, or the Himalaya range, which lie considerably above the table-land; for the mountain-passes by which the Himalayas are traversed are found to attain an absolute altitude of between 15,000 and 16,000 feet. The summits are still many thousand feet higher, and a few of them rise above 25,000 feet.

Bootan includes the southern declivity of the Himalaya range, and here on the boundary of Tibet stands the Changali which rises to about 25,000 feet; somewhat more to the east is Mount Ghassa, whose elevation has not been determined. The number of passes over the Himalaya in this country is said to be eighteen, but we have information only about one, the Soomoonang-pass, which traverses the range to the west of Changali, and according to the calculation of Bergbass, deduced from the thermometrical observations of Saunders, is 15,744 feet above the level of Calcutta.

The Mount Né, or the famous Née Shee Pass in Kumoon, which according to Webb rises 16,569 feet above the same level.

The northern parts of Bootan, which belong to the Alpine region, extend southward from the boundary of Tibet and extend in breadth for the most part of twenty miles, the slope of which is more than 5000 feet above the sea, and in many places less. The valley of Tassaudoon, according to Bergbass, is 4811 feet above Calcutta, and that of Panukka is still much lower. This rapid descent constitutes the character of the northern districts of Bootan. Summit which forms the summit of this range is covered with a thick carpet of mountain-masses of bare, black rocks, which, as they decline in height, begin to display short herbage, with here and there a straggling barberry-bush. Farther down, the holies make the most conspicuous figure on the slopes, and give way in some places to hazle and to birch, except when it is nearly vertical. The rivers rush forth like torrents, foaming violently among huge masses of rock that obstruct their tortuous course, in which they dash from one side to the other. Their progress is only interrupted by numerous falls, which continue sometimes for great distances, and whose volume is continually increased by the streams which descend from the contiguous heights with the quickness of an arrow. The spray rising from the numerous water-falls
loads the atmosphere with vapour, and renders the air extremely chilly, even in summer. In September or October the frost begins in the more elevated parts, which are uninhabited for four or five months of the year. In summer however they are visited by numerous herds of chowrytalled cattle and their herdsmen, as they offer abundant pasture. At the approach of winter, the cattle are removed to a few deep gians. Continuous to this inhospitable Alpine region is the most pleasant and best cultivated part of Boottan, which occupies about one-half of the whole country, extending about fifty miles from north to south. The mountains, though still covering by far the greatest part of the surface, probably never, or rarely, attain the height of 12,000 feet, and they descend with gentle declivities. These, as well as their summits, are clothed with high trees, especially pines and firs; and in some places a wide and very beautiful plain, on which no oak has been found. The valleys are open, and in many places they present to the husbandman a level from one to two miles broad, but he has extended his dominion to a considerable distance up the gentle declivities of the adjacent mountains, where he cultivates rice and the grains of Europe, while his orchards produce apples, pears, peaches, apricots, oranges, and walnuts, and the uncultivated spots are covered with strawberries, raspberries, and blackberries. The rivers which traverse the larger valleys bring down from the mountains a large quantity of timber, but the slope of the valleys is not very great, they continue their course by a tranquil though rapid current, while the smaller streams, which descend from the neighbouring mountains, rush down with the violence of torrents. Numerous villages, however, are situated on these streams, which unite and drain the hills and along the banks of the rivers. The climate resembles that of the southern countries of Europe. At Tassiaudon, in summer, the thermometer never descends below 60° nor rises above 80°. The summer is the rainy season, and the day is often filled with showers. The rains, as well as the western monsoon in the low plains of Bengal. In winter the country is for some time covered with snow, except at Panukka and Andipore (Wandipore) in the valley of the Tahan-tien, where snow is almost unknown. Indeed, thus, this is a region of great variety, for Mount Ghasa, descends more rapidly and much deeper than the other valleys, and Saunders found the temperature at Panukka nearly equal to that of Rungpore in Bengal. The inhabitants of that place are careful not to expose themselves to a vertical sun, while those of Ghasa feel all the rigour of winter, and are chilled by perpetual snow; yet both these places are in view of each other. On account of this mildness of the climate, the Dabraj, or sovereign of Boottan, has chosen Panukka for his winter-residence, thereby enabling him to go and come further north than Tassiaudon, where he passes the summer. 

Before the rivers reach the low plains of Bengal, they still descend another slope, which in somewhat more than ten miles sinks from upwards of 3000 feet to less than 300. Here the same story is related, of course the rivers, that they often do not present along the rivers room enough for men and horses to pass, and the roads have consequently been made on the side of high mountains along deep precipices. The sides of the mountains are in many places covered with trees, and there are two commercial passes by them; in other places they are covered with forests of fine trees, which however are useless, being inaccessible: they consist of saul, bamboo, plantains, and others peculiar to this tract, and known to the natives by the names of borough. They are all dressed down in a manner very similar to the way in which they dress in Europe. Some are clothed with moss and with creepers of surprising length and thickness, and not less remarkable for their flexibility and strength; hence they are an excellent substitute for rope. Agriculture in this district is confined to a few small spots; for though the rocks are covered with a rich and fertile soil, it is hardly over level enough to be cultivated. Cattle, however, and hogs find abundant food in the spontaneous produce of the woods. This region is exposed to the full south-west monsoon, and is unhealthy, at least to strangers, a season which begins in June, and continues till September. The swelling of the neck called in Switzerland goitre is more frequent here than in other parts of Boottan. 

To the south of this mountain-region, and only divided from it by a few miles of gently sloping ground, extends the Tariyani, noted all over Bengal for its forests and its unhealthiness. It belongs partly to Boottan. This region, which runs along the whole extent of the Himalaya range from the Brahmapootra to the Sutlej, and has on an average breadth of twenty or twenty-five miles, is an entire swamp. Numerous springs issue from the base of the mountains, and unite in rivulets; but as the country is a perfect level, the declivity of the soil is not sufficient to carry off the abundant inundation. During the rainy season it becomes stagnant, and forms a swamp abounding with the most exuberant vegetation. The soil is covered with rank grass, reeds, fern, and underwood, among which the bamboo grows to the height of thirty feet, and as thick as a man's wrist. It is overgrown by the most compact and loftiest timber of the forest. From this exhaustless store the remotest provinces of India, but especially Bengal, derive an ample supply of the best materials for constructing boats, and for all purposes of building. This swampy country is inhabited by numerous tribes of native men, such as tigers, and wild buffaloes; but the exhalations from such a surface of vegetable matter and swamps, increased by an additional degree of heat reflected from the hills, render the air highly injurious to the health of man. It is consequently very unhealthily inhabited, and by a very miserable class of people. Goitres are frequent among them.

Travelling in a country like Boottan is by no means easy and convenient. In the Tariyani it is performed by means of elephants; but in the mountainous parts, which have no elephants, must be undertaken on foot. This is the case which purpose the Tangan horse, the native breed of this country, is the only one that is suitable. Sometimes persons must be carried over some steep parts of the mountains on the backs of men. But every kind of communication is so slow and exacting that it has not shown great industry in building bridges. The great variety of these bridges, and their being always adapted to the river and other circumstances, evince no small degree of ingenunity and judgment. They are generally very neatly arches, and support the bridge in such a manner that they are laid horizontally from rock to rock. Over broader streams, a triple or quadruple row of timbers, one row projecting over the other, and inserted into the rock, sustain two sloping sides, which are united by a horizontal plate of wood or iron. These bridges are very strong, and the whole bridge forms nearly three sides of an octagon. Piers are very seldom used, on account of the unequal heights of the banks and the extreme rapidity of the rivers. The widest river of Boottan has an iron bridge, consisting of a number of iron chains, which support a wattled platform; and two chains are stretched above parallel to the sides, to support a wattle bordered, which is absolutely necessary to the safety of the passenger, who is not quite at his ease till he has landed from this swinging, unsteady footing. At another place a bridge is formed from two parallel chains, round which creepers are loosely twisted, from which suitable planks are suspended, the end of one plank resting upon the end of the other, without being confined. Over deep chasms, two ropes, commonly of rattan, are stretched across the river, and a rope is thrown from one mountain to another, and they are encircled by a hoop of the same material. The passenger places himself between them, sitting in the hoop, and seizing a rope in each hand, slides himself along with facility and speed, over a track sometimes almost perpendicular.

The most considerable river of Boottan is the Tehin-tien, which traverses the whole country from north to south, rising in the mountain-range between the Chamalari and Mount Ghasa, and running by Tassiaudon. Being several miles wide, it was formerly thought to contain two parallel streams, the Pa-tochen, which rises near Para and the Ha-tien, it finds a passage between the mountains of the lower range, from whence it is precipitated in tremendous cataracts, and rushing with rapidity between the high cliffs and rocks that oppose its progress, it descends at length into the plain a few miles east of Buxedwar, and finally joins the Brahmapootra, not much below Rangamuty, under the name of Gedadhar. Its whole course may be about 130 miles. Parallel to the Tehin-tien, but farther to the east, runs the large river of Chusan-tien, which is of a different character. Farther down the course of this river is not known, but it is sup
posed, after having descended from the higher hills, to flow through the flat surface of the district of Bijee, and to join the Brahmaputra several miles below its entry into Bengal.

The rapidity of all the rivers of Bootan is far too great to allow farther navigation or irrigation. The latter circumstance however is not of great importance, as the level country along their banks is of very small extent, most of the cultivated ground being situated on the sides of the hills, from which numerous rills descend. The slopes are cut in cut, and the water which is conveyed down them by the descending streams, which are made to overflow the beds successively. The natives show much industry in the cultivation of their fields, which are always neatly dressed. Rice, green-corn, wheat, barley, and sugar-cane of the polygenum of Linnaeus, which produces a triangular seed, nearly the size of barley, and is the common food of the people in many places. The level tracts along the Tehin-thien yield two crops in the year; the first, of wheat and barley, is cut in June, and the rice, which is planted immediately after, enjoys the benefit of the rains.

Horticulture is less attended to, though the country is fitted for the production of every fruit and vegetable common without the tropics, and in some situations will bring to perfection many tropical fruits. The most common fruits are apples, pears, peaches, apricots, mulberries, oranges, pomegranates, and walnuts. The apples are coarse, harsh, and ill-tasted, but the peaches and apricots are excellent. The vine, however, is not so useful. The banana is also cultivated, as are turnips, which are equal to those of the northern countries of Europe. They also grow shallots, cucumbers, gourds, and melons. The sugar-cane is cultivated at Andipore.

In the rocky soil, near the mountains covered with snow, a species of rhubarb plant (rheum undulatum) is found, and in some other parts a kind of cinnamon tree, the leaves of which are much used in cookery in Bengal, and known by the name of teezant. Paper is made from the bark of a tree.

Of domestic animals only horses, cattle, and hogs are kept. The horses are nearly all of them of a peculiar species, indigenous in Bootan, and found in none of the neighbouring countries. They are called tangun, vulgarly tannian, from Tangustan, the general appellation of the mountains of Bootan, but they are chiefly bred in the valley of the Pa-thien, the tributary of the Tehin-thien. They are usually thirteen hands high, and remarkable for their just proportions, uniting in an eminent degree both strength and beauty. They are short-bodied, clean-limbed, and though heavy yet extremely quick; are commonly of a piebald colour, with various shades of black, bay, and sorrel upon a ground of the purest white. Those of one colour are rare, and not so valuable in the opinion of the Bootesees, though much more esteemed by the English in India to which country a great number is annually exported.

The chowytail cattle, or yak (bos grunniens) [Asia, p. 482], pastures in summer among the snow-topped mountains which constitute the boundary between Bootan and Tibet, and in the winter it descends into the deep gorges farther to the south.

Wild animals are so extremely rare in the mountainous districts of Bootan, that Turner does not notice any, except a kind of monkey, the hummowint of India, the largest in this part of the world. The elephant is rarely met with. They have black faces, surrounded by a streak of white hair, and very long slender tails. They are only found in the mild climate near Panukka, and are held sacred by the Bootesees as well as by the Hindus. Bees are common, and managed with great care. Among the troublesome animals, leeches and a kind of pestiferous fly are noticed.

The mineral riches are little known, and still less used. Of metals only iron and copper are found, and only the former worked. There are no towns in Bootan, and even large villages are rare, consisting generally of not more than ten or twelve houses. Only the palaces of the lamas, of the Daeb rajas, and the governors of the provinces, and the numerous fortresses, deserve notice; a drawing and description of the palace of Tassudun are given in Turner's Embassy to the Court of Teshoo Lama, p. 90, 91. The fortresses are always built on very advantageous sites, generally at the confluence of two rivers.

The natives of Bootan, called by the Hindus Bootesees or Botiyas, belong to a very extensive nation, which occupies the higher regions of the Himalaya range westward to the valley of Cashmere: in Bootan alone they are in possession of the whole mountain-tract. The structure of their temples and their festivals prove that they belong to the same race which is spread over the south of Eastern Asia, and comprehends the Birman as well as the Chinese.

The Bootesees are Buddhists; but in their religious ceremonies they differ widely from other nations. The ceremonies of the Mandarins are small to their kings and gods, and the Buddhism is preserved.

They are never opened, and the whole divine service of the people consists in processions made round the temple, accompanied with the mystical words, 'Om man ni padme hum.' The men form the head of a temple, and if travelling on horseback, diamond and walk by. Near the temples are many tall flagstaffs, which have narrow banners of white cloth, reaching nearly from top to bottom, and inscribed with the same mystical words. Besides this there is a high rail, without, the usual size of fifteen feet in length, six feet high, and two thick, with a central part distinguished by being thicker and higher than the sides. On both faces near the top are inserted large tablets, with the same mystical words out in relief.

The import of these words, according to the explanation of Schmidt, is 'The jewel of the Buddhistic fullness is truly revealed in the Padma (Lotus) flower.'

They consider the Dharma Raja as an incarnation of the Divinity, and he is their religious chief as well as their temporal. He is also their legislator. Besides the head of the divinity, he takes no part in the internal or external affairs of the country, which are entirely left to the management of the Daeb Raja, except that the Dharma Raja appoints one member of the state council. This council consists of three members, chosen from the tribe of whom the Daeb Raja can do nothing of consequence. This sovereign has to receive the public money, and to distribute it among the officers of government, or to employ it for the support of religion, all which is done according to custom.

The number of priests, called gylongs, is considerable, and amounts to upwards of 5000. Their principal duty consists in the study of the religious books, which seem to be numerous, and full of metaphysical distinctions. They are excluded from all commerce with the other sex, and are not permitted to cultivate the ground; but they may enter into trade, and accept public offices.

The Bootesees do not kill any animal, but they eat the meat of those which have been killed by others, or have died a natural death. No woman eats the meat of the first day with warm water, and the following day they are immersed in a cold river. No religious ceremonies are observed on entering into matrimony. Rich people take as many wives as they like, and among the poor four or five brothers have only one wife, the eldest being as belonging to the eldest brother. Thus we find in Bootan both polygamy and polyandary. Women abandon themselves to a depraved life up to their twenty-fifth or thirtieth year, after which they marry. The dead are burnt, and the gylongs officiate on such occasions; the ashes are thrown into the river. On the house of the burned person flagstaffs are erected, in order to accelerate the regeneration of the owner.

Bootan has some commerce with all the neighbouring countries, and the country trade is that with Bengal and Tibet. The commodities for Bengal consist of Tungan horses, linen-cloth, muscows, chowries, oranges, walnuts, and mungit (a kind of red colour): they are brought to Rungpore, where they are exchanged for woolen cloth, coarse cottons, indigo, sandal-wood, assagadis, and spices, all which articles are consumed in the country or sent to Tibet. The same commodities are sent to Nepal and Assam, with the addition of rock-salt. Part of the commodities brought from Bengal are sent to H. Laos, in Tibet, with rice, wheat, sugar, and pounded gold and silver, in exchange.

The Bootesees import from Cutch Behar cattle, horses, dried fish, betel, tobacco, and coarse cottons. Commerce in Bootan is monopolised by the government, the governors of the provinces, and their officers. (Turner's Embassy to the Court of Teshoo Lama, and Kirkman Kent Bose, in Asiatic Researches, X.)

BOOTS (from the Greek θοτος, boe, 'an ox'), one of the old constellations. Its name signifies the herdman.
In the preceding, we have availed ourselves of the edition of Flamsteed’s Catalogue, just printed by the Adairly, under the superintendence of Mr. Baily. We have entirely followed his magnitudes so far as they go; and the queries attached to a letter indicates that it is the letter which has been commonly used, but which has not been admitted by Mr. Baily in his revision of the nomenclature and restoration of Bayer. We shall adopt the same plan in future. The numbers are Flamsteed’s: those in () are Pazzii’s: those in [ ] are Piazzi’s in Booth, Barton. This eminent actor was descended from an antient and honourable family, being the third son of John Booth, Esq., a near relation of Henry Booth, Earl of Warrington, in Lancashire. He was born in 1681, and educated at Westminster by the famous Dr. Busby. Becoming at a very early age remarkable for the grace of his action and the sweetness of his voice, he was selected to perform the character of Phaethus in the ‘Achilles’ in Hereford, at which he gained the curiosity of all the scholars. The great applause he met with on this occasion was, by his own confession, the first spur to his theatrical ambition; and on being removed to Cambridge at the age of seventeen, to the great annoyance of his parents, who had intended him for the church, he ran away from Trinity College, and joined a company of strolling players. The misdeeds of some of the actors, while at Bury in Suffolk, caused the dispersion of the company, and young Booth returned to London in great distress. He was speedily forgiven, and kindly received by his family: but his stage-fever had by no means abated, and in one of its fiercest paroxysms he absolutely engaged with a Mrs. Miss to perform at Bartholomew Fair, where he achieved such renown, that Betterton heard of him, and was prevented engaging him for Drury-Lane only by the fear of offending the noble family to which he was related. Shortly afterwards Booth formed an acquaintance with Ashbury, the manager of the Dublin theatre, who chanced to be in London, and with him he went to Ireland. In June, 1698. His first appearance in Dublin was in the part of Oronoko, and his success, decided from the commencement, continued for two years increasing daily, when he determined to return to England, and having by letter reconciled himself a second time with his family, he acceded to the recommendation to Mr. Betterton, who with great candour and kindliness engaged and assisted him to the extent of his power. In 1701 Mr. Booth made his first bow in the Theatre Royal, Drury-Lane, in the character of Maximus, in Lord Rochester’s ‘Voyage to France.’ His reception was enthusiastic, and he shortly established himself in public favour, as second only to his great friend and instructor Betterton. In 1712, on the production of Mr. Addison’s ‘Cato,’ Mr. Booth performed the principal character, and in Cookson’s ‘Friendship,’ as Mephistophiles, he received fifty guineas, collected in the boxes during the performance, as a slight acknowledgment of his honest opposition to a perpetual detator, and his dying so bravely in the cause of liberty. The managers of the theatre also presented him with an equal sum, in consideration of his talents having secured the play; and shortly afterwards Queen Anne, at the request of Lord Bolingbroke, granted a special license recalling all former ones, and nominating Mr. Booth joint manager with Wilks, Cibber, and Doggett. In 1727 Booth was attacked with an intermittent fever, and continued forty-six successive days without intermission, and from the effects of which he never perfectly recovered. In 1729 he was prevailed on to play, for seven nights only, in The Double Falsehood, and they were his last performances. After his removal to his country seat, in Walton-in-the-Green, he expired, May 10, 1733, of a complication of disorders, in the fifty-third year of his age. Mr. Booth was twice married; first in 1704, to a daughter of Sir William Barkham of Norfolk, Bart., who died in 1710 without issue; and, secondly, in 1718, to a lady of the name of Sanger. He was a very beautiful and wealthy actress, who survived him, but also without issue. His will, a copy of which is printed in the London Magazine for 1733, bears strong testimony of his regard for her, and assigns his reasons for bequeathing to her the whole of his fortune, which he acknowledges he received from her on the day of their marriage, but which he had diminished at least one-third.

Booth’s masterpiece as an actor is said by Cibber to have been Othello, but his favourite part was the far less important one of the Ghost in ‘Hamlet,’ a performance, says Macklin, which has never been imitated successfully. His tone, manner, and gait were so solemn and unearthly, that the audience appeared to be under the impression that a positive spectre stood before them. The soles of his shoes were covered with velvet, as well as the edges of his frock, which he glided more than walked over, thus completing the illusion. Victor, speaking of his person, says he was of a middle stature, five feet eight, his form rather inclining to the athletic, though nothing clumsy or heavy, his air and manner of speech, the gravity with which he studied his profession, and his obvious sweetness in his countenance. His voice was completely harmonious, from the softness of the flute to the extent of the trumpet: his attitudes were all picturesque; he was noble in his design, and happy in his execution. He was an amiable, good-hearted man, a lively companion, and deficient of his own abilities, by which means, says his biographer, he acquired the love and esteem of every one. So much was he in favour with the rich and noble of his time, that even lords had no need to wait in order to see him. He was not a nobleman in the kingdom, says Cetoth, who had so many sets of horses at his command. The chariot-and-six of some one or another was sure to be waiting for him every night to take him to the play, after the play, to Windsor, where the King’s servant was to prepare for him and to bring him back the following day in time for the theatre.

Boothia. [N. West Passage.] Boothon, an island of the eastern seas, lying off the S.E. extremity of the island of Celebes. The 3rd parallel S. and the 133rd meridian E. intersect the island, which is about the middle of the island. Boothon is about 85 m. long from N. to S., and its average breadth is about 20 m.: it is separated from the island of Pangansane, or Passangane, by a narrow strait, the water in which is deep enough to allow the passage of large vessels: this passage is called the Strait of Boothon. The island is mountainous and woody, but is well cultivated in parts, yielding abundant crops of rice, maize, yams,
and the usual variety of tropical fruits. Fowls and goats are reared for food, and buffalo are pretty numerous.

On the east side of Bopaul is a deep bay, called by the Dutch Dauela, or Mistake Bay. There is danger in calm weather of ships being drawn by the set of the currents into this bay, in which case many anist of about 340 m. in the

coming in of the east monsoon. When Mr. De Clerk was on his voyage to assume the government of Banda, he was detained during a whole year in this inlet.

The inhabitants profess the Mohammedan faith; those who reside on the coast speak the Malay language. The island is an independent government under the king, who rules likewise over the neighbouring small

island. The Dutch East India Company formerly maintained a settlement on the island, to which they every year sent a small army and a small Navy. The company then made a treaty under a contract with the king of Bopaul, to whom the company made an annual payment of 360 guilders (about 30l.) as an equivalent for the privilege, and for the assistance which he bound himself to give them in destroying the

trees. The title of the existrator. (Stavronin's Voyages; Forrest's

Voyage to New Guinea.)

BOPAUL, or BHOPIAL, a small independent principality in Central India, lying between 22° 53' and 23° 43' N. lat., and 80° 41' and 81° 15' E. long. From E. to W. is 120, and its extreme breadth from N. to S. 60 m.; its area is computed at about 5000 sq. m. This

principal is bounded on the N. and W. by the dominions of the Mahatta Chief Dowlat Rao Scindia, and on the S. and E. by the dominions of the Nerbouda, in the possession of the British East India Company; the river Nerbouda forms a natural boundary throughout the whole extent of the S. and W. Bopaul is one of the native states of India under British protection; but the Company's government has not found it necessary to invade the coast. The principal products of the soil are rice and sugar, both of which are shipped in abundance to the East Indies.

A hilly tract, forming part of the Vindyha mountains, passes through the capital of Bopaul from E. to W. The soil is generally fertile, especially in the valleys, where it consists either of a loose, rich, loamy soil, or of a more compact stony soil. The principal vegetables grown are rice, sugar-cane, and wheat; the latter is the chief article of export. The principal trees are the mango, the cashew, and the coconut.

Boracite. [Luther.]

BORACIC ACID, formerly called Homberg's sedative soda and sedative salt of borax, is a compound of the elementary body of boron and oxygen. It exists not only as above mentioned, but also in large quantity in combination with soda in the East Indies, forming borax or the bicominate of soda. Further, it is a common constituent of the solutions of salts of boracic acid, termed borates, it is procured by dissolving four parts of it in sixteen parts of boiling water, and adding one part of concentrated sulphuric acid to the filtered solution. The resulting solution is a boracic acid for the soda, sulphate of soda is formed, and the boracic acid separated crystallizes as the solution cools: it is to be allowed to drain, to be redissolved in boiling water, and again crystallized to separate the sulphuric acid which adheres to it. In order to precipitate entirely from this acid, Berzelius recommends that it should be fused in a platinum crucible, and again dissolved in boiling water and crystallized.

Boracic acid has the form of small, lightly brilliant colourless prisms, shining with a gumy lustre. This acid is insoluble in water; its taste is not strong, and scarcely at all acid. It reddens litmus paper but slightly, and turns turmeric paper brown, as the alkalis do. Water at 60° dissolves about 1-26th of its weight of this acid, and boiling water nearly one-third. Boracic acid may be shown by the following experiment: Boracic acid is added to a solution of malachite; a yellow precipitate of carbonic acid, the alkali carbonates with effervescence, and at a red heat it expels most of the volatile acids from their bases.

Boracic acid is composed, according to

2 equivalents oxygen 24° 94 1 do. boron 10° 91 1 do. boron 8

Boron, a compound of boracic acid and soda, is a robust and hard substance, which is used in the mineralogy. Boracic acid is used in chemical investigations, and was formerly employed in medicine.

Borates are the salts which contain boracic acid: of these the only important one is

Borax, a compound of boracic acid and soda, the correct appellation of which is carbonate of soda. This salt is imported from the East Indies under the name of tincal or rough borax. It is supposed to be the substance called by Pliny chrysopolita. Geber in the seventh century mentions borax: its nature was pointed out by Geoffroy in 1733 and
Baron in 1748. It is said to be brought from Persia, Ceylon, and also from Tibet, from a lake entirely supplied by springs, a fifteen days' journey from Teeso Lumbro the capital. Tiucal as imported is mixed with a fatty matter, which may be separated by acids.

The crystals of tiucal are bluish or greenish white, and are sometimes nearly transparent, but more commonly opaque. They are soft and brittle. The primary form is an oblique rhombic prism. Tiucal is purified by solution in water and crystallization, and is then sold as borax.

Borax has rather an alkaline and sweetish taste, acts like alkali upon turmeric paper, and is soluble in twelve parts of cold and two of boiling water. It effloresces slowly by exposure to the air, and when two pieces are rubbed together in the dark they become luminous. When moderately heated, borax swells and loses about four-tenths of its weight, and assumes the form of a light porous friable mass, and is called calcined borax. When very strongly heated, it melts into a transparent glass. It is composed of, according to Thomson:

| 2 equivalents boric acid | 69°38 | 2 equivalents | 48° |
| 1 do. soda | 31°32 | 1 do. | 32° |
| 10 do. water | 90°10 | 8 do. | 72° |

Borax is also prepared, both in England and France, from soda and the boracic acid imported from Tuscany. This salt is little employed in medicine, but is used extensively both in chemical investigations and in the arts as a flux.

The primary form of common borax is an oblique rhombic prism, variously modified; but it has been found by Mr. Payen that if a saturated solution of borax at 174° be slowly cooled, it deposits crystals when the temperature is above 103°, which are in the form of the regular octahedron. These crystals contain only half as much water as those just described.

BORAGINEAE, a natural order of regular-flowered mono- or dicotyledons, which are readily distinguished from all others by having their ovary deeply divided into four lobes, from the middle of which arises a single style. They are moreover characterized by their flowers being arranged in a gyrate manner before they expand. The common borago is often taken as the type of this order, and in fact represents not only its peculiarities of structure, but sensible properties; for all the known species agree in having an insipid juice, and their surface covered over with stiff white hairs, which communicate a peculiar asperity to the skin, whence these plants were formerly called apert-folie, or rough-leaved. Some few of the species, with perennial woody roots, yield from those parts a purplish colouring matter, used by dyers under the name of alkane. Anchusa tinctoria, Liotaspernum tinctorium, and some kinds of Onosma, are the best known for this quality.

BORA'SSUS, a kind of palm-tree, called Tala in Sanscrit and Palmira by the English, in imitation of the Portuguese, who name it Palmeira brava. It is defined by Roxburgh as having discous hexandrous flowers; the calyx and corolla in the males consisting each of three distinct pieces, and in the females of from eight to twelve in a confused state; and the ovary of three cells, changing to a three-seeded drupe. There is but one species according to writers on Indian botany; but it is not certain that more than one distinct palm is not confounded under the common name of Palmira. That which is recognized is called Borsus fuselliformis. This plant grows all over India both on the continent and in the islands, where it is esteemed of the greatest use on account of its pungency and sugar which are extracted from it. Its trunk is from twenty-five to forty feet high when full grown, and is perceptibly thicker at the base than at the summit. The leaves are fan-shaped, about four feet long, and placed upon stalks of about the same length, which are spiny at their edges; each leaf is divided into from seventy or eighty rays, which are ragged at the end, and the largest of which are placed in the centre. The fruit is about as big as a child's head, three-cornered, with the angles rounded off, and a little furrowed. It consists of a thick, fibrous, rather succulent, yellowish brown rind, containing three seeds the size of a goose-egg. When young the shell of the seed is so soft that it may be readily pierced by the finger, and the pulpy matter which it then contains is cool and sweet and refreshing; but when ripe all this changes to a hard bluish...
Dr. A. T. Thomson states, that when bichromate of soda and honey are mixed in equal portions, a chemical union takes place, by which a deliquescent salt is formed. This likewise happens when the bichromate is added to a solution or mixture of honey and water.

The taste of borax is sweetish, slightly alkaline, and refrigerant.

In Britain borax is chiefly employed as a local application to pimply sores, particularly of the mouth of children, and is applied either in powder, dissolved in water, or mixed with sugar or honey. If the opinion entertained by Dr. Thomson be correct, that it is the new salt resulting from the union with honey which is the useful agent in these cases, and not the bichromate, although the last method is the only proper one: it is also the most agreeable, and therefore to be preferred, especially when the honey of roses (mel rosorum) is employed to form the compound.

The compound of borax with honey of roses, added to a proper quantity of warm water, forms, when cold, a very efficacious gargle in many cases of ulcerated sore-throat. But the employment of borax is much too limited in Britain. It possesses an influence over the uterus similar to that of ergot of rye, which renders it as useful in protracted parturition, as is the warmer boric acid to the child. (Hufeland's Journal, December, 1823, p. 114; and November, 1824, p. 123.)

It is also serviceable as a refrigerant in slight febrile affections. But its external employment is more worthy of notice: in diseases of the mucous and follicular parts, it is of great efficacy. A weak solution of it in rose-water, kept constantly applied by means of a thin linen cloth, over the redness which often affects the nose of delicate persons, relieves the sense of heat, and removes the florid colour. Many other cases of this kind have been observed in a similar way. It is also a very useful application to inflamed piles, and also to chilblains. (Geri. Magaz. fur Pharm. vol. xxii. p. 36.)

BORBORUS (Ipheroeris of Latreille), a genus of dipertous, or two-winged flies, of the family Muscidae. Its chief characters exist in the posterior thighs, which are much compressed, and the two basal joints of the posterior tarsi, which are considerably larger than the following. The head is covered in front by a reflexed tibia, and the tarsi are minute. The tarsi diverge, and are sometimes almost as long as the fore part of the head. The second cell of the posterior extremity of the wing (the last of the two which occupy the middle of its length) is closed before it reaches the margin.

These little flies are found in marshy places, and on putrid substances, but more particularly dung heaps, in which probably their larvæ reside; they are always abundant amongst cucumber frames, and are of a brownish colour: most of the species when expanded would scarcely measure a quarter of an inch in length.

BORDA, JEAN CHARLES, born at Dax, May 4, 1733, of an ancient family, distinguished in the military service. He showed an early taste for mathematics, and overcoming the objections of his father, began his studies in military engineering, but afterwards entered the dragoon regiments. This change he made in order to remain at Paris, where D'Alembert, to whom he had been presented, had recommended him to fix himself, and look forward to the Academy of Sciences. In 1756 some mathematical memoirs procured him admission into that body. He was at the battle of Hastenbeck in 1757, after which he returned to the engineer service (into which he was admitted without examination), as interfering less with his pursuits. He was immediately employed at a sea-port, and this circumstance decided his future career. From this time to 1769 he published various memoirs as well on hydrostatics as on pure analysis. He tried, both by experiment and theory, various matters connected with navigation and ship-building. In 1771 he entered the naval service. In 1771 he embarked in the Flora for America, with MM. Verdun and Pingré. The object of the voyage was to find methods of improving the performance of watches at sea; the observations, &c. made were published in 1775, under the title of 'Voyage fait par ordre du roi, &c. par M. M. de Verdun.' &c. In 1778 he was sent to two years' survey the Canary Islands. He ascended the peak of Teneriffe, ascertained its height, and corrected some tables he had formerly made for finding the distance of a ship from it by means of its apparent height. Here he introduced into the French naval surveys the use of reflecting instruments, instead of determining
positional compass-bearings. He served under D'Estraing in 1777 and 1778, and in 1782 was sent with a sixty-four gun ship to convey troops to Martinique. He then joined De Grasse's squadron, and being detached with a small force of frigates on a cruise, he found himself, on the clearance up of a wind, in such an advantageous situation that he attacked and defeated a Spanish squadron. He defended himself stoutly, enabled the rest of his ships to escape, and was then obliged to give up his own vessel (the Soleil) a perfect wreck. On reading this extraordinary account of a single ship defending itself for three hours against a squadron in the event, a condition given to it at the beginning of the action, we thought it might be safe to compare it with the official account of the English admiral, and we find another version, namely, that in the month of December, 1782, the Soleil fell in with the squadron of Sir John Fielding, consisting of the Ruby of 60 guns, commanded by Captain Collins, overtook her by dint of sailing, and captured her in forty-one minutes, a perfect wreck, the only circumstance in which the two accounts agree, and on which the admirals take occasion to harry each other. The event forms part of the États in the 4th volume of the Mémoires of the Institute.

A sketch of this kind is not the place to describe inventions or methods, which will be found in their proper places. In 1765 Meyer had proposed a whole circle of reflexion, and in 1780, the inventor of the binnacle. In 1785, he accounted for his own improvement of the idea, since so well known, in 1787, under the title of Description et usage du Cercle de Reflexion. The recurring circle (a further modification of the idea of Meyer) was not described by himself, but appears as far, so far as we can find, in the Exposé des Opérations, &c., (94 pages) published in 1791 by the three commissioners, Cassini, Méchain, and Legendre, appointed to superintend the French part of the junction of the observatories of Paris and Greenwich.

In 1790 he found by experiment the length of the pendulum at Paris (which at that time was contemplated as the basis of the new system of measures). His means and result are described under Pendulum. From that time to the end of his life he was employed in the improvement of his methods for executing the means of forwarding the great survey: the methods for measuring the base were formed under his inspection, and he was in fact the inventor of most of the original instruments employed. It has been said that his skies of the present millennium, as we may call them, are for him experimental philosophy for which the French have since become distinguished, and it certainly appears to us that there is some truth in the observation.

In the meanwhile he had charged himself with the expediency of the plan of a large atlas of logarithmic lines, &c., corresponding with the new division of the circle into 400 degrees. These were published in 1801, under the title of Tables Trigonométriques Décimales, &c. (An. ix.) with revision and an explanation, by Delambre.

Borda was of a delicate and lively turn. Whereby, he is said to have been able to make two translations from French into Latin at once, in different terms, from dictation, one for himself and one for his next class-fellow. He was fond of poetry and the antient writers, and particularly attentive to the songs of Borda A' Riu, one of the classes of agricultural occupiers of land mentioned in the Domesday Survey, and, with the exception of the villani, the largest. The origin of their name, and the exact nature of their tenure, have been variously interpreted. Lord Coke (Inst. lib. i. §. i. fol. 5 b. edit. 1628) calls them 'boors holding a little house with some land of husbandry, bigger than a cottage.' Nichols, in his 'Introduction to the History of Leicestershire,' p. xiv., considers them as cottagers, taking their name from living on the 'branched land,' (bord) which the ploughman refused by Domesday itself, where we find them not only mentioned generally among the agricultural occupiers of land, but in one instance as 'cires aulam manentes,' dwelling near the manor house; and even residing in some of the buildings of the church. In two quarters of the county of London, at the time of forming the Survey, as well as in king Edward the Confessor's time, there were 116 burgesses, and subordinate to them 100 bordarii, who aided them in the payment of the gold or tax. (Dom. Ed. Book, tom. i. fol. 203.) In Norwich there were 420 bordarii; and 20 are mentioned as living in Thetford. (Ibid. tom. ii. fol. 116 b. 173.)

Bishop Kennett says, 'The bordarii often mentioned in the Domesday Inquisition were distinct from the serviles and were the owners of a small servile condition, who had a bord or cottage with a small parcel of land allotted to them, on condition they should supply the lord with poultry and eggs and other small provisions for his board and entertainment.' (Gloss. Paroch. Antiq.) Such also is the interpretation made by Mr. Bodley, in the History of Norfolk. Brady says 'they were drudges, and performed vile services, which were reserved by the lord upon a poor little house, and a small parcel of land, and might perhaps be domestic works, such as grinding, threshing, drawing water, cutting wood, &c.' (Paroch. Antiq. of Norfolk.)

Bopo, as Bishop Kennett has already noticed, was a cottage. Bordarii, it should seem, were cottagers merely. In one of the Ely Registers we find bordari, where the brieve of the same entry in Domesday itself reads cotarii. Their condition, which here makes a considerable bend, having the city on its concave bank, which is lined with extensive quays; and as the buildings extend to the greatest distance from the river about the centre of these quays, and cover a narrower space as they approach the extremities, the whole is of the plan of the small cities of ancient Greece. Half a mile below the town the bend of the river is so great, that a line or chord drawn from N. by W. to S. by E. and joining the two extremities or horns of the crescent, not only includes a portion of the river, but also of the opposite or convex bank, and still leaves much more room for a line or chord (measured on the Plan of Bordeaux, published by the Society for the Diffusion of Useful Knowledge) is about two miles: the distance between the same points along the bank of the river is about two miles and a half; and along the convex boundary of the town towards the open country, more than four miles and a half: the greatest breadth from the river towards the country, drawn from W. by S. to E. by N., is about a mile. Bordeaux is a very antient city. It was an important place, in the time of the Romans, where a sea-port was founded by the Rhodians, and erected by the Ionian Greeks, and designated Antioch of the Gironde. In the geography of Strabo it is mentioned as the Aspros (emporium), or chief trading-place of the Berō-γρατος (in Latin Bituriges), who were surname coloni (locei) according to Strabo, Ubicici or Vibiscii according to others, or Vibiscii according to Aurelius Victor; and they were a Celtic nation (a branch probably of the Bituriges Cubi who inhabited the province of Berri), and had settled within the limits which Cesar assigns to the Aquitanii. Strabo describes the town, which he calls Bosphoros (Bourdigal), a small port to the west of the city of Bordeaux, and meaning a place up to which the sea (or tide) flows. Ptolemy writes the name in the same manner as Strabo; but

* The former of these two is now the prevalent mode of writing this name: in the time of M. D'Anville the practice seems to have been more variable; D'Anville himself gives some reasons for preferring 'Bourdigu.' Derrienne, the Benedictine, in his History of Bordeaux, contends for the latter, but says that custom has established the use of 'Bordeaux.' - It is observable that Verneus says this is an old form, more ancient than that of Bordeaux; and in a very ancient map of France in the British Museum (Venice, 1696) it is written Bordus.
the Latin writers give Burdigala and Burdigala. The importance of Burdigala is shown by the circumstance, that it was made the capital of the province of ‘Aquitania Secunda’ in the subdivision of the Gallic provinces, about the middle or latter end of the fourth century. Ausonius, a Latin poet of the fourth century, himself a native of this place, has left a description of it in his poem *Claris Urbis*, or *Ordo Nobilium Urbium*, from which we take the following extract:

*Impia landuum condemno silentes, qui te, O patria, festinam Baccho, buoylique, unique, Maris linguisque hominum, procerumque senata, Non inter primas memor: quas consuls orbis Exiguit, immittis dutem contingere laudes. Non puder his nubias: Nece amit barbara Rheni Om, nec Arcto domus est gladiis in Hamo; Burdigala est nata salus: clementia curit. Milis ubi, et rigue largis ingenuitatem terre; Verti regis, tenebrosque borea, lugubre subvenit. Fecundas squamose imitata fuita mentis.*

*Claris Urbis*, xiv, B.

*I have long been condemning my impious silence, in not mentioning among the chief [cities], thee, O my country, renowned for wine, and streams, and men; for the manners and talents of thy inhabitants, and [thy] council of the nobles—as though conscious of the small [extent of my native city], I hesitated to touch upon unmerited praises. No blame do I feel for this reason. Not mine the barbarous bank of the Rhenum, nor is my city dwelling in the northern Hamus. Burdigala is my birth-place, where the temperature of the sky is mild, and great the liberality (i.e. fertility) of the watered earth. Long is the spring and short the winters; and close at hand are wood-crowned eminences.* The waters are ruffled with tides like those of the ocean. The form of the walls is quadrangular, and so lofty with its high towers, that [their] summits pierce the airy clouds. You will admire the well-arranged [distinctas, adorned] streets within, the disposition of the houses, and that the broad-ways [plateae] still [justly] preserve their name: and then [you will admire] the gates corresponding to the streets which cross at right angles, *directa compit* and the bed of the stream from a spring, flowing through the midst of the city; and when Father Ocean has filled this with his up-flowing tide, you will see the whole water covered with fleets.*

Besides the stream mentioned in the above extract, Ausonius notices another which supplied a handsomely adorned and copious fountain, and which he calls Divina. The site of the Roman Burdigala, as we gather from the above extract, was a quadrangle: the greater diameter of this quadrangle extended nearly from E. to W. The gates appear to have been fourteen in number: four on the north, and as many on the south side, and three each on the eastern and western sides. La Porte Basse, the last of the gates, was demolished about twenty or twenty years since. Of the walls and towers some remains it is probable exist still. The stones used in the foundations of the walls were of a great size. Two Roman edifices survived the various devastations of the city, and came down to modern

* As the country on the west side of the Garonne is flat, we must suppose the port to refer to the hills on the opposite bank.

* Called the Divina (now La Divaise) of the dock which was formed in its channel (now covered over) no vestiges remain. See Elias Vinetus, Commentary on Ausonius.
days. The ruins of one of these, the amphitheatre, or, as it is called, Le Palais Galien, 'the palace of Gallienus,' yet remained, and was visited during the foundation of the baths of Julian, called Palais Tutele,' as it is called by Venet, was demolished when Louis XIV. rebuilt Château Trompette, in the latter part of the seventeenth century. It stood on what was the esplanade of the castle, which has in its turn been demoli-
ished. The only part remaining of the theatre was a few fragments of the theatre, which form a part of the church of the church of Charles Medoc. Its greater diameter when entire was 226 French, or about 241 English feet; its smaller diameter 166 French, or 177 English feet; its external elevation 60 French, or 64 English feet. During the Revolution the site was sold as national columns, and the arena defaced with a number of little houses, to which, the most perfect remains of the amphitheatre were made to serve as foundations, or for the erection of which the stones of this interesting monument of a former age were appropriated. The circuit of the arena may be traced however all round, and there remain many arches constructed with alternate courses of brickwork and of small square stones When Venet published his L'Antiquité de Bourdeau (1574), this building was in much better preservation. He has given an engraving of it, and Palais Tutele was so admired by some that it has been a temple consecrated to the tutelary genius of the city. It consists of a baseament about 96 English feet long by about 70 wide, and 23 or 24 high, upon which had been erected twenty-four Corinthian pillars, supported by columns, which were placed at the side, and six at the front. Upon these columns were supposed to have been placed the statues of the emperors of the first and second centuries. But the pavement over these columns was taken away, and the pavement over the columns was taken away, and the columns were cut up for building material. (Stuart's and Revett's Antiquities of Athens, last edit. vol. iii. p. 120 note.) There are few other remains of Roman antiquity. Some inscriptions and some statues, part of them mutilated, which have been found, have been collected together by Milliet in his Manu Mudi de la France; Devienne, Histoire de Bourdeaux.)

Notwithstanding these remains of antiquity have been found in the city, some learned men (and among them Adrian de Valois), misled by some passages in Gregory of Tours and a number of inscriptions, which are attributed to Roman Burdigalia was on the site of the Gallo-Roman town, and that it was not till the sack of the city by the Saracens that the citizens transferred their abode to the other side of the Gironde.

Under the Romans Burdigalia was not the scene of any important historical event, except the assumption of the purple by Tetricus (one of those commonly but inaccurately designated 'the thirty tyrants'), in the reign of Gallienus, in the third century: it derives its reputation rather from the zeal with which literature was cultivated. Annonius has sung the praises of its numerous professors. Devienne, in his 'Histoire de Bordeaux,' tells us that in the school of this city religious profession formed no bar to entrance; that Christians and Pagans studied there alike, and that even females and virgins were among the students.

Early in the fifth century (412) the Visigoths first attacked Gaul and possessed themselves of Burdigala and other places. Being obliged to withdraw into Spain, they burnt part of this city. After some years they became masters of the land, and it continued in possession of their kingdom, of which Tolosa or Toulouse was the capital. Under its new masters Burdigala declined; and the persecution of the Catholic Christians by the Arian Visigoths is represented as one cause of its downfall. After the death of the last Visigoth king, in the sixth century, a civilization went on under the hands of the Frankish conqueror Clovis, who, after the battle of Vouillé, in which he defeated and slew Alaric, king of the Visigoths, wintered in this town. In the troubles which agitated France under the Visigoths after the death of Clovis, the city of Bordeaux, when the successful ambition of Charles Martel seemed to promise a more vigorous government and greater internal tranquillity, this unfortunate city was attacked by the Saracens, and being unable to resist their fury, the greater part of the public buildings were burned, and the inhabitants nearly all put to the sword. This event occurred about 723 or 732.

Domestic troubles, caused by the attempts of the Dukes of Aquitaine to become independent of the kings of France, agitated the south-west of France, after the defeat and expulsion of the Saracens by Charles Martel: but that the chief of the dukes had been dispossessed by Charles Chauve (the Bald), who reigned about the middle of the ninth century, with the duchy of Gascony, of which it became the capital. But prosperity in those dark ages only rendered it more the object of attack; Burdigala, or, as we may call it now, Bordeaux, was taken twice, and underwent a more complete destruction than any which it had yet experienced. The houses were almost entirely destroyed, and the unhappy Bordeaux abandoned for a time their native city.

When the Normans received from Charles the Simple, about the close of the ninth or beginning of the tenth century, the province called from them Normandie, they desisted from ravaging the rest of France; and Bordeaux was rebuilt and repopulated, and became again the residence of the Dukes of Gascony, who were built here the castle or palace of L'Ombrante. Upon the union of the counties of Angoulême and Gascony, the dukes abandoned Bordeaux for Poitiers, which had been the capital of the duchy of Guiane; and Bordeaux was reduced to the capital of a county, to the possession of which it gave titles. Yet it still continued to be an important place, and it may be questioned whether it did not resume its rank of ducal capital; for here it was that Louis VII. of France (le Jeune) espoused Alienor or Eleanor, heiress of the united duchies of Guiane and Gascony. The divorce of this princess, and her subsequent marriage with Henry the Second, count of Anjou and Duke of Normandy (Henry II.), caused Bordeaux to become part of the extensive dominions which the English monarch possessed in France.

Bordeaux now became the capital of Guiane, a duchy formerly held by the districts of Bordeaux, Agenoys, Quercy, Perigord, Limousin, and Saintonge. This province remained to the English kings when Philip Augustus, in the beginning of the thirteenth century, stripped them of all their other French possessions. Among those who held during this period the title of Duke of Guiane was the Duke of the English crown, were Richard Cour de Lion, during the lifetime of his father, Henry II.; and Richard, duke of Cornwall, better known as king of the Romans, brother of Henry III. In the reign of this last-named king, the Hotel de Ville of Bordeaux was erected, and, in the time of the last Duke of Burgundy, was restored and rebuilt, and in the time of Philip the Second, the Duke of Burgundy, was restored. In the time of the last Duke of Burgundy, was restored and rebuilt, and in the time of Louis XIV., when the town was again erected and the new Hotel de Ville was built, which was afterwards much extended.

When the capital of Guiane was transferred to Bordeaux, the people of Bordeaux were so enraged at the change, that they rose in open rebellion against the government of Guiane. The people of Bordeaux were so enraged at the change, that they rose in open rebellion against the government of Guiane. But the desire of the people of Bordeaux was gratified, and the town was restored to its ancient state. But the desire of the people of Bordeaux was gratified, and the town was restored to its ancient state. But the desire of the people of Bordeaux was gratified, and the town was restored to its ancient state.

The consequences of the revolution of the twelfth century were felt in the disorders which followed, and the reign of Edward I. was marked by a series of civil wars, in which the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved. But the disorders continued, and the king was often involved.

In the reign of Edward I. of England, a dispute having arisen between the King of France, Philippe IV. (le Bel), Edward, whose attention was occupied by his wars in Scotland, agreed to deliver up Bordeaux and the rest of
Guineau to the French, upon a promise that it should immediately be restored. This was intended to satisfy the indignation of Philippe, to whom Edward owed fealty for his French possessions. When the cession had been made, and restoration, agreeably to the convention, was demanded, Philippe insisted that it was to be restored; and it was not until ten years after that the king of England re-entered into the possession of this part of his inheritance. Edward II., son and successor of Edward I., having quarrelled with Charles IV. (a Bel) of France, lost all Guineau except Bordeaux, and one or two other places; Guineau was given up by Charles, not to Edward himself, but to his son Edward, prince of Wales. This was in the early part of the fourteenth century. Either by Edward II. or by Edward III., when he became king of England, upon the death of his father, he made himself the caput of the principality of Guineau, which Edward III. formed in favour of his valiant son, from the provinces of Poitou, Saintonge, Agenois, Perigord, Limousin, Quercy, Bigorre, the territory of Jaure, Angoumois, Rouergue, and all that was once the kingdom of the Count of Poitiers. For many years were passed by this prince at his new capital in all the splendour of sovereignty; and here was born his son, the degraded and unhappy Richard II. When the affairs of the English declined, and there seemed a probability that Guineau (which was됽 bounded before the erection of the principality in favour of the Black Prince) would be conquered by the French, the inhabitants of Bordeaux formed a convention with those of several other cities for mutual succour and defence. The league was signed, and on the 7th of the month of October, Richard II. ceded the duchy of Guineau to his uncle, John of Gaunt. Duke of Lancaster, they refused to be separated from the English crown. So warmly were they attached to Richard as a native of their city, that when one of those who were suspected of having murderred him arrived in their city, they rose and massacred him.

Bordeaux, and the province of which it was the capital, maintained its connexion with England during the reigns of Henry IV. and V.; but in the reign of Henry VI., upon the breaking out of the French war, it was conquered by the French and the connexion was broken. In 1435 the Bordelais capitulated to Charles VII. of France on favourable terms; but very shortly after they revolted to the English, and the valiant Talbot, Earl of Shrewsbury, then upwards of eighty, was sent with an army to subdue them. The resistance of the people and the destruction of his army forced them again to submit to the French king (1453), on much harder conditions. To secure the fidelity of the Bordelais, and to prevent any attempts from the English, Charles caused to be erected the Château Trompette on the summit of the Castle of Ha.

The events which preceeded and accompanied the submission of Bordeaux to the French tended much to reduce its population and to diminish its grandeur; the favour shown to it by the Kings of France tended, however, to revive it. But an insurrection occasioned by the unpopular government of its governor, brought new calamities. In the year 1458 the people rose, and being assisted by the country folks of Guineau or the neighbouring provinces, committed great excesses; and when the tumult was quelled, the brutal Montmorency, constable of France, inflicted terrible severities upon the unhappy townsmen.

The progress of the Reformation in France having alarmed the supporters of the dominant church, several Protestants were put to death. In this persecution the local administration, aided by the garrison of the city, carried out the orders of the government, and numerous persons were burnt by their order. The new opinions how ever spread, and in 1561 there were about seven thousand of the Reformed in this city. When the religious animosities broke out into open warfare, the Protestants, in 1563, entered the town of Bordeaux, and threw down the Château Trompette; but the Château Montmorency, to which the attempt failed. When the massacre of St. Bartholomew was made the signal of a general attack on the Protestants throughout France, Bordeaux had its share in the atrocity. Two hundred and sixty-four Protestants were butchered here. In the reign of Louis XIII. in 1635, the weight of taxation gave rise to another insurrection, and some bloodshed in its suppression, which was effected by the resolu tion of the mayor and corporation of the city. Bordeaux lost its privileges, and hostilities ensued both by land and sea. The court supported the Due d'Épernon; the parliament of Paris supported that of Bordeaux. The commandant of the Château Trompette having fired on the city, that for city of Bordeaux was captured and burned. A new settlement was made in the city, and by a peculiar charter to the crown of England: this connexion, which was declared to be inseparable on any ground whatever, was formed by the desire of the municipal authorities. The war between France and England which had signalised the reign of Edward III., Bordeaux became a place of great importance. From it the Black Prince set out on that expedition which led to the battle of Poitiers, and to the meeting of Jean II. and the Duke of Lancaster at Leper, and thus ended the capture of the principality of Guineau, which Edward III. formed in favour of his valiant son, from the provinces of Poitou, Saintonge, Agenois, Perigord, Limousin, Quercy, Bigorre, the territory of Jaure, Angoumois, Rouergue, and all that was once the kingdom of the Count of Poitiers. For many years were passed by this prince at his new capital in all the splendour of sovereignty; and here was born his son, the degenerate and unhappy Richard II. When the affairs of the English declined, and there seemed a probability that Guineau (which was borne before the erection of the principality in favour of the Black Prince) would be conquered by the French, the inhabitants of Bordeaux formed a convention with those of several other cities for mutual succour and defence. The league was signed, and on the 7th of the month of October, Richard II. ceded the duchy of Guineau to his uncle, John of Gaunt. Duke of Lancaster, they refused to be separated from the English crown. So warmly were they attached to Richard as a native of their city, that when one of those who were suspected of having murderred him arrived in their city, they rose and massacred him.

The progress of the Reformation in France having alarmed the supporters of the dominant church, several Protestants were put to death. In this persecution the local administration, aided by the garrison of the city, carried out the orders of the government, and numerous persons were burnt by their order. The new opinions however spread, and in 1561 there were about seven thousand of the Reformed in this city. When the religious animosities broke out into open warfare, the Protestants, in 1563, entered the town of Bordeaux, and threw down the Château Montmorency, to which the attempt failed. When the massacre of St. Bartholomew was made the signal of a general attack on the Protestants
narchy, greater powers than the municipality has enjoyed since. The police of the town and the public instruction were under their charge, and in respect of the latter Bordeaux seems to have lost rather than gained by subsequent events. The Place Royale was the work of Louis XIV, and his successors those local authorities seem to have acted with considerable judgment and public spirit.

When the Revolution broke out in 1789 the Bordeaux partook of the general fervour in the cause of liberty. Their intercourse with the Anglo-American States had prepared their minds for rejoicing in the establishment of a freer government. The city became the capital of the department of Gironde; from which were sent some of the most eloquent members of the Legislative Assembly, Vergniaud, Guadet, Genouin, and others. From the influence of these men the party in the Assembly to which they belonged took the name of Girondists. When the Royalists committed great excesses against the Protestants of Montauban, Bordeaux contributed largely to the military force which marched against that city. When the Girondists were overthrown, and several of its leaders executed, others took refuge in the south of France, and of these Valadi, Salies, Guadet, and Barbazan, having been discovered, were executed at Bordeaux, and dreadful severities were perpetrated by the deputies whom the Convention sent thither. When the Royalists sought in 1793 to excite a re-action in the south, they opened some communications with their adherents in this city, but the movement was defeated. Under the empire, the inhabitants desired the return of peace, the long war was associated with a distinct loss of cor-

merce; but they received with honours the Emperor Napoleon and his emperor Josephine in 1808. The kings of Spain, Ferdinand VII. and his father, Charles IV., passed through the city the same year.

In 1828, the French, Spanish, and Portuguese forces, under the Duke of Wellington, invaded France. Their advance encouraged the Royalist party, which had continued to exist at Bordeaux, though in a very feeble state; and on the 12th of March, M. Lynch, the mayor, advanced to the Convention and surrendered the city into them, and hoisted the white flag. When Bonaparte returned from Elba in 1815, and the royal family fled in different directions, the Duchesse d'Angoulême sought to make a stand at Bordeaux; but the national guard and the troops of the line refusing their aid, she was compelled to withdraw. Upon the arrival of the intelligence of the 'Ordonnances' of Charles X. in 1830, the Bordeaux broke out into insurrection, and the tri-color was substituted for the white flag of the Bourbons before the news arrived of the return of the King.

The principal increase of the buildings of Bordeaux has taken place towards the north, or, following the course of the river, the lower part of the city, with which the former suburbs of Les Chartrons and St. Seurin are now united. The older part of the town, which is called, the streets are narrow and crooked, and the places or open spaces irregular; but not so in the new pars, in the Quartier des Chartrons, which is the residence of the merchants, and in the Quartier du Chapeau Rouge, which is on the site of the Château Pau. The approach by water is magnificent. The width of the Garonne, which is here from 600 to 800 yards wide, twice the breadth of the Thames at London, and the curve which it makes, render the pro-

spect of the city on this side very striking. The dock-yards, the Colonial Institute, the church of St. Pierre, and the buildings of the Quai des Chartrons, extend along the line of the river to a great distance.* The bridge excites astonish-

ment by its length; and the quantity of shipping in this noble port, which will contain 1000 vessels, and admits those of greatest tonnage, adds liveliness to the scene.

The houses are of great magnificence, and fitted up in a manner corresponding to the wealth and commerce of the place. The inhabitants are reputed to live in a style of greater splendour and luxury than in any town in France. The cafes, to which the houses facing the river and the faiences are superior to the hackney coaches of London. The Place Royale, which is on the bank of the river, is remarkable rather for the buildings which surround it than for its extent. It was formerly adorned with an equestrian statue of Louis XV., but this was overthrown at

* Exempli, in his "Dictionnaire des galans de la France" (1792), speaks of Bordeaux as "the most elegant and most costly city in France.

1 The 19th of March, 1814, was the day on which the municipal authorities concluded the treaty of peace to the English, and terminated the last war in the Bordeaux.
Bordeaux has some fine hospitals, Le Grand Hôpital de St. Andre is near the cathedral. It is spoken of by M. Millin (Voyage dans les Departments du Midi) as well managed. The Bishops' asylum and a foundling hospital. The latter is near the river, in the south quarter of the city; the building is very extensive and commodious; and many hundreds of children, from infancy up to twelve years of age and more, are sheltered and brought up in it. In 1789 the number was 2,000 or more in it, and 2,006 in the same year in the country. For an account of the Dépôt de Mendicité, and of the state of the wretchedly poor in this city, the reader is referred to the parliamentary report on the state of the foreign poor.

Bordeaux is the capital of the department of Gironde, the largest department in France. The arrondissement of Bordeaux comprehends 1668 square miles, or 1,067,520 acres, and is consequently larger than the county of Kent, but much less populous; it is subdivided into 18 cantons, or 153 communes. It has in 1832, 24,374 inhabitants. Bordeaux is the seat of a Cour Royale, or high tribunal, the jurisdiction of which extends over the departments of Gironde, Charente, and Dordogne. It is the capital of the eleventh military division, which includes the departments of Landes, Gironde, Dordogne, Lot, Lot et Garonne, and Basses Pyrénées.

The diocese of Bordeaux is doubtless very antient. Some have attempted to carry its origin as far back as to the first century, but it is scarcely needful to observe that this supposition is unsupported by any historical evidence. This was the bishopric of the year 300, for one of them was at the first council of Aries, held in 314. When the diocese was raised to the rank of metropolitan it is not certain. The archbishops took the style of Primates of Aquitaine, but this dignity is usually conferred by the Archbishop of Bordeaux.

They have nine suffragan bishops, the Bishops of Agen, Angoulême, Condé, Luçon, Périgueux, Poitiers, La Rochelle, Saintes, and Sarlat. At present the diocese is co-extensive with the department of Gironde; and the archbishop has six suffragan bishops, one on each side of the Garonne, the Bishops of Agen, Angoulême, Périgueux, Poitiers, and La Rochelle.

Bordeaux is the native country of some eminent men, the poet Decius Magnus Ausonius; St. Paulinus, bishop of Nola, a father of the fifth century; Benoquin, the author of the Gallicas.; *L'Ami des Enfants,* &c.; and Gensonne, the celebrated deputy of the National Convention, and afterward of the Assembly of Bordeaux. They have nine suffragan bishops, the Bishops of Agen, Angoulême, Condé, Luçon, Périgueux, Poitiers, La Rochelle, Saintes, and Sarlat. At present the diocese is co-extensive with the department of Gironde; and the archbishop has six suffragan bishops, one on each side of the Garonne, the Bishops of Agen, Angoulême, Périgueux, Poitiers, and La Rochelle.

It is in the present department of Gironde, to which we refer the reader for a fuller description of its physical features. Suffice it to say here that it includes one of the most important wine countries in France. The immediate neighbourhood of Bordeaux is well watered, and less than six brooks flow through that town, and to the west of it is a marsh the level of which is below that of the springs which cross it. The streams which flow toward the sea being prevented from reaching it by sand hills, form the estuary of the river. The Garonne is the principal of these streams. Its mouth is near the town of Bordeaux, a mere sandy heath, and in the midst of this are several marshes. [GIRONDE, DEPARTMENT OF.]

**BORE, a phenomenon which occurs in some rivers, near the mouth at spring tides. Bore is probably an Indian word, but we cannot suggest any etymology unless it come from the Hindustani 'bôr,' signifying 'deep.' When the tide enters the river, the waters suddenly rise to a great height, in some rivers many feet above the surface of the stream, and rush with tremendous noise against the current of the sea tide. It occurs in all parts of the world, but the part of the Bordeaux is a mere sandy heath, and in the midst of this are several marshes. [GIRONDE, DEPARTMENT OF.]

**BORECOLE, a kind of cabbage with curly leaves, and no disposition to form a heart or head. It is chiefly valued for winter use. After the more delicate kinds of vegetables have been rendered unfit for cooking by the severity of frost, this form of the cabbage tribe is in its state of greatest excellence. Its firmness, its farthest reaching roots, its hardy qualities, its large leaves and flowers, and the fact that it is not subject to pestilential diseases, as is proper for a bore that the river should fall into an estuary, that this estuary be subject to high tides, and that it contract gradually; and lastly that the river also narrow by degrees. The rise of the sea at spring tides pushes a great volume of water into the wide entrance of the estuary, where it accumulates, not being able to flow off quick enough into the narrow channel. The greater the force of the river the narrower becomes, and it reaches the mouth of the river, the swell has already obtained a considerable height above the descending stream, and rushes on like a torrent.**
The difficulty of erecting the bridge was increased by the depth of the river, which in one part is twenty-six feet at low water, and of the same depth at high water, and the rapidity of the current, which is often ten feet in a second, and by the shifting and sandy bottom.

Of the ecclesiastical edifices of Bordeaux the cathedral is the most worthy of notice. It is an ancient Gothic edifice, not of the Romanesque style, but of a more perfect and more finished Gothic architecture than the cathedral of its island. It was built separate from the church in the thirteenth century, after the expulsion of the English, since remarkable for its height, has suffered much from the weather. The church was the residence of the bishop of Bordeaux before the place of Montaigne. Eleven Catholic and three Protestant churches are mentioned in Reichard’s Descriptive Road-Book of France, and there is a magnificent Jews’ synagogue, built in the time of Napoleon.

Bordeaux had an abbey that of St. Croix of the Benedictine order, which was held in commendam when Ex- pily wrote, in 1762. There were also before the Revolution three seminaries for the education of the priesthood, a rich commandery of the order of Malta, and several religious houses both for men and women. The Chartreuse of the thirteen order of the Carthusians in the suburb of St. Seurin was very magnificent. The church formerly attached to it is richly decorated. The vineyard of this Chartreuse is now converted into a public cemetery, like that of Père la Chaise at Paris.

As a place of trade Bordeaux is eminent. Its commerce in the early part of the eighteenth century was very considerable, and Martinienne (Grand Dictionaire) enumerates articles of the trade dried plums, resin, vinegar, and especially wine, of which in time of peace 100,000 casks were exported. This wine is sent not only of the neighbourhood of Bordeaux, but also of Langue- doc and the district of Montauban. The opening of the great Canal du Midi, which united the Garonne with the Mediterranean, tended much to promote the trade of this place. It enables the Bordelais to supply the south of France with colonial produce almost as cheap as the Mar- seillais. The loss of St. Domingo was injurious to Bor- deaux, with which that colony had many important connexions, and to which much of its produce was consigned. But of late years this injury has been more than repaired by the opening of the Danube, especially in articles of perfumery, in the distillation of various liqueurs, &c., in weaving stocks, carpets, and cottons, and the making of earthenware, porcelain, lattices, casks, hats, paper, vinegar, and nitric acid. Among the liqueurs prepared here, the anis ear is much celebrated. There is a royal still manufactury near the castle of Ha, in which 500 per sons are constantly employed, many refining houses for sugar, some iron foundries, and rope walks. These manufactories furnish articles for exportation, especially to the French colonies, primarily to the West Indies. Brandy, almonds, prunes, chestnuts, walnuts, cork, turpentine, resin, tartar, cream of tartar, verdigris, linens, and colonial produce are shipped to various parts of Europe, to the French colonies, to America, or to India. Brandy is the principal outlet of the wine of Bordeaux, and is the principal outlet for the wines of the western districts of France, and even of the southern and midland districts. Claret is chiefly shipped at Bordeaux, and is the produce of the neighbouring country. The first growths, those of Château Margaux, Lafitte, Latour, and Haut Brion, are, from the district of Médoc on the left bank of the river Garonne below the city of Bordeaux. Two small ships are stocked with sugar, coffee, cocoa, and other articles, from the French West Indian colonies; tin, lead, copper, coal, hardwares, timber for ship building, masts, hemp, hides, horns, salt beef, and salted salmon from England, Holland, Northern Europe, and America. Many vessels are built, and many hundred workmen employed in the vast building yards which extend along the river. There are at Bordeaux two large fairs, one of which opens on the 1st of March, and the other on the 15th of October. (Mallet Brun; Balbi; Dictionnaire Geographique, par Robert; Masculoich’s Dictionnaire of Commerce, &c.)

The shipping belonging to the port of Bordeaux amounted in 1833 to 78,915 tons; in 1831 it was as much as 98,733 tons, including 15 steam-vessels of the aggregate burthen of about 30,000 tons. They estimate the length of the port, exclusive of coasting vessels, in each of the three years ending with 1832, were as follows:

Very few of the vessels belonging to Bordeaux are engaged in the coasting trade, but a considerable number are employed in the whale fishery. Between one-fourth and one-third of the French colonial trade is carried on by the merchants of Bordeaux.

About twenty-four per cent. of the total ships and a tenth part of the brandy were sent to this kingdom.

The population of Bordeaux in 1832 was 100,362 for the city, or 109,467 for the whole commune. The population of the town in 1810 was 93,639, and in 1820, 89,204. The patois of the country is spoken by the Jews, by the unwedu- cated classes, and the population of the outskirt; the other inhabitants speak French.

This city has numerous establishments for education and the promotion of science. It has an Académie Universi- taire et College Royal, or high school; schools of archi- tecture, hydrography, and navigation; botany and natural history; drawing and painting; medicine and surgery. There is a school for the deaf and dumb, founded in 1785. When Mr. Milford visited this institution in 1814 it contained 100 persons, chiefly young; the establishment was in high repute. There are several learned societies, as the Academy Royale des Sciences, Arts, et Belles Lettres; La Société Royale de Médecine; La Société Medico-Chirurgicale, &c. The public library contains 110,000 volumes, among which is a copy of the Encyclopédie in its original form, with marginal corrections. The botanic garden is maintained by the government for the purpose of naturalizing exotic plants, of which, as well as of indigenous plants, it contains a good variety. There are a museum of antiquities and a gallery of pictures, which contain several rooms in one of the wings of the royal palace; and a cabinet of natural history, which is well kept up, in the hotel of the Academy Royale. In the museum of antiquities are the inscriptions and bas-reliefs dug up in the city and its environs. There is an observatory. (Balbi; Mallet Brun, &c.)
Besides the use of borage for boiling, the fresh leaves are often employed for garnishing other dishes, for which some of the above-mentioned well-adapted side dishes of the gay colours with which the leaves are often variegated. A variety called the Buda kail is also blanched for winter and spring use by putting a flower-pot over the leaves, but it is inferior to sea kail, and more troublesome to procure.

Borore, like all other cabbages, may be increased by slips of its stem, without the necessity of raising it annually from seed; and, provided care is taken to perform this operation in dry weather, it is attended with almost certain success. This method is however little practised in England.

BOREL and BORELLI. Our object here is to prevent two contemporaries being confounded, who have the same Latin name, Borelius.

Pier Boerel of Castres, born 1620, died 1689, was the author of the treatise De vero Telescopii inventore, Hague, 1655, a work often cited. He was a physician by profession.

Giovanni Alfonso Borelli, of Naples, born 1668, was also a physician. He wrote su Etudes Restitutus, 1698, discovered and translated the lost books of Apollonius [Apollonius Perigeeus], and also wrote the first theory of Jupiter's satellites, entitled Théorie Médiocrium Planetuum ex causis physice deductus (published in 1699). He was the first to make use of the law of physical action, and of the principle of the conservation of force and momentum, in unifying his discussion of his observed phenomena in a way that is often referred to in modern discussion of the same phenomena. He also wrote some important works on the theory of motion, including moving powers; and he proves that the length of the limb, and the distance at which the limb or power is inserted from the extremity of the limb, or centre of articulation, influence the quantity of force required for the contraction of the muscles, which is a fundamental principle of the theory of the mechanics of the length of the lever and the distance of the power from the fulcrum alter the quantity of force required. He demonstrated too, that the muscles act at a disadvantage, considered merely as levers. In his attempts to estimate the force required in number, his fall, where success was probably impossible. He calculates the power of the heart to be equal to a weight of 180,000 pounds, a calculation shown to be erroneous by Keil. Though in this and other computations Borelli was shown to have erred considerably, yet his general principles were long appealed to; and even the operations of muscles were supposed to be explicable on mechanical principles.

Borelli invented an apparatus by which persons might go a considerable depth under water, remain there, move from place to place, and sink or rise at pleasure; and also a boat which two or more persons might row themselves under water.

BOREUS (Lateille), a genus of insects of the order neuroptera, and family panopidae. This genus, of which only one species is known (B. hyenalis), is not only remarkable for its peculiar appearance, but particularly for the fact that its having been found in the winter months only, and is said even to have been seen on the Alps running about on the snow: its most common abode however appears to be in mosses.

B. hyenalis is about one quarter of an inch long and of a greenish colour, with the legs inclining to red; and, unlike the rest of its tribe, the female possesses no wings, and those of the male are only rudimentary. The antennae are long and thread-like, the parts of the mouth are provided with a strong mandibule. In July, August, and September, the male is furnished with a large ovipositor: it is rather a fine insect in this country.

BORGHESI, an Italian family originally from Siena, where they ranked among the patricians of that republic. In the early part of the 17th century, a Marcus Antono Borghese, a jurisconsult of some distinction, settled at Rome, where he was employed as advocate of the papal court. He had several sons and daughters. His third son, Camillo, born in 1552, became pope in May, 1605 (Paul V.). The eldest son, Giovanni Battista, married Virginia Lanti of Pisa, by whom he had Mare Antonio Borghese, who by the influence of his uncle the pope was made prince of Sulmona, and grandee of Spain. Paul V. bestowed on him other domains in the papal state. Mare Antonio began a line of princes of the name of Napoleon and continues. His son Paolo married Olimpia Aldobrandini, the only child of the prince of Rossano, and grand niece to Pope
Aldobrandini (Clement VIII), and thus the Aldobrandini inheritance came into the Borghese family. Paolo's son, Giovanni Battista, prince of Saluggia and Rossano, duke of Palestrina, was also ambassador in France as well as papal legate in the court of Rome, where he died in 1717, and was buried in the splendid family chapel at Sta. Maria Maggiore. He left numerous legacies for charitable purposes, and remitted to all his vassals their arrears of rent, fees, and other dues, which were called collettari. On his death, Marc Antonio Borghese, was made vicar of Naples for the emperor in 1721. Another Marc Antonio, a descendant of the vicar, was Prince Borghese in the second half of the last century, who was well known as a patron of the fine arts and a great collector of pictures and antiquities, with which he enriched his fine villa on the Pincian Hill. He left two sons, the eldest Don Camillo, who early embraced the part of the French, and went to Paris, where he married in 1803 Marie Pauline Bonaparte, Napoleon's sister, and wife of the Emperor. He was made in 1805 prince of the French empire, afterwards duke of Guastalla, and lastly governor-general of the departments beyond the Alps, which included the former states of Piedmont and Genoa, then annexed to France. In his new capacity, Prince Borghese fixed his residence at Turin, where he held a sort of court, and seems to have behaved so as to conciliate the inhabitants. He sold to Napoleon his fine museum of the villa Borghese, at Rome, for thirteen millions of francs, the amount of which he received in得很great part, of the sister of the emperor. The Napoleonic Prince Borghese returned to Rome, and afterwards fixed his residence at Florence, where he built a magnificent palace, and lived in great splendour. He gave splendid balls, which were much frequented by foreigners, and became a leader in the fashionable world. However, at that time he did not neglect his Roman residence, and he replaced in great measure by fresh acquisitions of statues and reliquies for his villa, the former collection which is in the museum of the Louvre. Prince Don Camillo died in 1812; his wife Pauline had died in 1806. As they left no issue, his younger brother, who till then went by the title of Prince Aldobrandini, has assumed the title of Prince Borghese.

The House of Borghese has estates in the papal territory, in the province of Naples, in Tuscany. In the immediate neighbourhood of Rome alone it is possessed of 45,000 acres of ground, besides the estate of Palombara in Sabina. The vast town palace Borghese at Rome has a rich gallery of paintings. Besides the celebrated villa on the Pincian Hill, the largest and finest of the Borghese family, called also Belvedere, at Frescati, and other mansions on their various estates. The villa Borghese or Pinciana at Rome has been described in several works. (Montelattini, Villa Borghese fuori di Porta Pinciana, con due autobiografie di artisti, 1864.)

There have been several cardinals of the Borghese family, one of whom, Scipione, nephew to Paul V., figured in the disputes between that pope and the republic of Venice. He began the Villa Borghese. (Tournon, Etudes Statistiques sur Rome; Moreri's Dictionary; Valery, Voyages en Italie, &c.)

BOGORA, or BORJA, a family originally from Valencia in Spain. Alessio Borja was raised to the pontificate in 1443 by the name of Calixtus III. One of his sisters married Geoffroy Lenosi, likewise a Spaniard, who assumed the name and arms of Borja, there being no male heir of that family. Geoffroy had two sons, one of whom became Pope Felix III of Rome, and the other, Rodrigo, was afterwards Pope Alexander VI. Before his exaltation to the Pontificate, Alexander had four sons and one daughter by Vanoza, a woman whose parentage is not exactly known. The eldest son John was made Duke of Gandia in Spain by King Ferdinand of Aragon, and Duke of Gandia and Count of Caudetes, in Italy. When his father was elected pope, in 1494, Cesare was studying at Pisa. He immediately went to Rome, where he was soon after made Archbishop of Valenza in Italy, and afterwards cardinal. Cesare was early noted for his energy as well as for his abilities and dexterity. His younger brother Geoffroy having married, in 1461, Sancia, natural daughter of Alfonso II, King of Naples, was made Duke of Squillace. The arrival of the French under Charles VIII. at Rome, in 1495, obliged Alexander VI. to forsake Alfonso, and apparently to countenance Charles's invasion of the kingdom of Naples. Charles even required Cardinal Cesare Borja to accompany him to Naples. Whether or not this was done, the treaty at Naples (the Duke of Gandia) in waging a war of extermination against the Orsini, Colonna, Savelli, and other baronial families of the Roman state, whose castles and lands they seized. In June, 1497, John Borgia Duke of Gandia was put to death in the night by his vassals through the influence of unknown assassins. His brother Cesare was strongly suspected of the murder, as he had expressed his jealousy of his brother's secular rank and honours, while he himself felt no relish for his ecclesiastical dignities. The charge however against Cesare rests on mere suspicion, but the character was so bad, that he was considered capable of any deed, however atrocious. Soon afterwards Cesare resigned his cardinalate, and in 1498 was sent by the pope to France with the bull of divorce between Louis XII. and his wife Jeanne, daughter of Louis XI., after which Louis XII. married Anne of Brittany. On this occasion Louis made Cesare Duke of Valentinois in Dauphiny, from which circumstance he has been generally styled by the Italian historians Due Valentino. In May, 1499, he married Char- troise, the eldest daughter of King Charles VIII. of France, having again crossed the Alps and taken the Milanese. Louis XII. sent a body of troops under Yvon d'Alégre to join those of Cesare Borgia, who was then waging war against the petty Lords of the towns of Romagna, who refused to submit to the authority of the French king. Cesare was made Duke of Romagna and Gonfaloniere of the Holy See. He then turned his arms against Giovannina Sforza, whom he compelled to march out of Bologna, where he had entrenched himself, and Malatesti. The people of Faenza defended themselves bravely for nearly a year on behalf of their young prince Astorre Manfredi, then fifteen years of age; at last they surrendered on condition that both Astorre and his brother Enrico should be allowed to remain as hostages. Cesare then ravaged the territory in both prisoners to Rome, where they were cruelly put to death in 1501. He then attacked Bologna, but was stoutly resisted by Giovanni Bentivoglio, with whom he concluded a truce. In the same year he marched against Florence, but was obliged to retreat through the intervention of Pope Julius II. He next accompanied the French army in its invasion of Naples, under d'Aubigny, and was present at the taking of Capua, where the greatest atrocities were committed by the invaders. Borgia seized upon a number of women whom he sent to his palace at Rome; others were publicly sold. In 1502 he took Urbino and Camerino, where he put to death Giulio da Varano and his sons.

The army of Borgia was composed chiefly of mercenaries; and he had several condottieri under him, such as Vitelleschi and Colonna, followed by Oliverotto of Ferno, Paolo Orsini, and others. These men, either jealous of his power or afraid of his ambition and treachery, deserted his cause while he had gone to Lombardy to meet King Louis XII. On his return to Romagna, Borgia resorted to his usual stratagems. He offered a reconciliation with the revolted condottieri, and induced them to repair to Sinigaglia, where he went himself, accompanied by a troop of men. He there seized upon their persons. The exception of Pietrucci of Siena and Baglione of Perugia, who were permitted to join Borgia, and to negotiate for a separate peace with many of their followers. Sinigaglia was plundered on that occasion. Machiavelli, who was with Borgia as envoy of the Florentine republic, gives a graphic account of the whole tragedy in his characteristic cool and concise style. When they arrived the next day, he found Cesare Borgia, Orsini and other members of the same family, and ordered them to be put to death in prison. Borgia at this time was the terror of all Central Italy, from the Adriatic to the Mediterranean: he aimed at making himself, with the counte-
name of the pope, independent sovereign of Romagna, the Marches and Umbria. On the 18th August, 1503, Alexander VI. died, after a great supper, at which Cesare was present, who felt himself dangerously ill at the same time, and it has been said, though without sufficient evidence, that Cesare was poisoned, and was mistaken for a Cardinal of the name intended for Cardinal di Cereto. The death of the pope ruined Borgia’s fortunes. His troops were defeated by Buglione and Orsini Giordano (Duke of Bracciano), he was driven out of the Vatican, and most of the towns of Romagna rose against him. Cardinal Della Bevere, who was elected pope, and was an old enemy of the Borgias, arrested Cesare and obliged him to give orders to his lieutenants to deliver up the fortresses they held of Borgia. Borgia took refuge at Naples, where he offered his services to Gonzalo of Cordova, who was then on the point of invading Sicily, but he had his secretary of state arrested and sent him prisoner to Spain. He was confined by King Ferdinand in the fortress of Medina del Campo, where he remained about two years. Having found means to escape, he went to his brother-in-law, the King of Navarre, who was then at war with one of his feudatories. Cesare served in the Navarrese army as a volunteer, and was killed in 1507 by a musket-shot at the siege of the small town of Viana near the Ebro. His body was buried without any honours in a church of Pamplona. (To- masi, Vita di Cesare Borgia.)

BORGLA, LUCREZIA, sister to Cesare, was betrothed while yet a child to a Spanish nobleman, but her father having become pope, married her, in 1493, to Giovanni Sforza, Lord of Pesaro, with whom she remained four years, when they separated. She then lived at the court of 1498, to Alfonso Duke of Bisceglia, natural son of Alfonso II. King of Naples. On this occasion she was created Duchess of Spoleto and of Sermoneta. She had by Alfonso a son Rodrigo, who was brought up at the papal court, but died young. In 1500, Alfonso renewed his attack on the steps of St. Peter’s Church by a party of assassins, and stabbed in several places; he was carried to the pontifical palace, where he died two months after. Cesare Borgia, as usual, was suspected of the crime. Lucrezia then retired for some time, and was afterwards recalled to Rome by her father, and intrusted with the affairs of the government during his absence. Such at least is the report of Burchard, the correctness of which however is doubted. (Roscoe’s Dissertation on Lucrezia Borgia, in the 1st vol. of his Life of Leo X. and also Bossi’s Notes to the Italian translation of that work.) Towards the end of 1501 she married Alfonso d’Este, son of Ercole Duke of Ferrara, and made her entrance into Ferrara with great pomp on the 2nd February, 1502. Gibbon, in his posthumous work, Antiquities of the House of Este, states that Lucrezia’s marriage with d’Este took place while her former husband was still living, and that he was put out of the way to make room for her successor, an assumption perfectly gratuitous, as the negotiation did not begin till nearly a twelvemonth after husband’s death. At Ferrara Lucrezia appeared as the patroness of literature. Bembo, who was then at that court, conceived an attachment for her which appears to have been of a platonic nature. (Mazzucchelli: art. Bembo and Lucrezia Borgia.) Ten autograph letters of Lucrezia to Bembo are preserved in the Ambrosian library, together with a lock of her hair which she sent him in one of them, and some Spanish verses addressed to her by Bembo. Bembo continued to correspond with the Duchesses of Este long after he had left Ferrara and entered into the main body of letters to Lucrezia, a respectful friendship. Lucrezia was the mother of three sons by Alfonso, who had a high opinion of her, and entrusted her with the care of the government while he was absent in the field, in which capacity she seems to have conducted herself as to gain general approbation. In the latter years of her life she became more rigid in her manners and more assiduous in the practice of devotion and charitable works. In short, her behaviour after she became Duchess of Ferrara affords no grounds for censure. Her house, 30 miles from Ferrara, and her father, had been the subject of much molecy, which seems to rest however chiefly on inferences from her living in a flagitious court, where she witnessed the most flagellate scenes. Still there is no individual charge substantiated against her. The marriage between her and Bembo, besides, Roscoe has shown, is not even grounded on Burchard’s Ditarium, but on some epigrams of Fontano and other Neapolitan poets, the natural enemies of her family, and from whom Guicciardini probably derived the report, for he states it as ‘a rumour which it is difficult to believe,’ and yet upon this subsequent writers, and Gibbon among the rest, have grounded their assertions of the charge. Of any particulars in the compilation by Bembo, or in any of her husband’s atrocious deeds, she has never been accused. At Ferrara she was highly praised by Strozzi, Tibaldio, Ariosto, and other poets of the court. Bembo dedicated his Asolani to her, and Aldo Manuzio, in the dedication prefixed to his edition of Strozzi’s works, speaks of her as an excellent princess and a liberal patroness of his art; the historians Giraldi, Sardi, Libranor, mention her in terms of the highest commendation. All this can hardly be mere flattery, for even flatterers from so many different writers could not have been so generally in the same mistake. The accusation of Lucrezia has been represented. A drama full of horrible but gratuitous fictions concerning her life was published and performed at Paris in 1833, under the title of ‘Lucrezia Borgia.’ A likeness of Lucrezia is found in a medallion in the collection of R. Heber, Esq. Lucrezia died at Ferrara in 1523. (Roscoe, Bembo, and Mazzucchelli.)

John Duke of Gandia left a son who perpetuated the family of Borgia. One of his descendants was canonized at St. Francis de Borgia. Another Borgia was Viceroj of Paris, and died in 1558. Lastly, Cardinal Stefano Borgia (Prefect of Propaganda), a learned and amiable man, who died in 1804, while accompanying Pius VII. on his journey to Paris. The Museum Borgia at Velletri, rich in Egyptian and Mexican antiquities, belongs to this cardinal.

BORGHESE, property of Cardinal de Borghese, gave name to the Borgese, a district of Rome, in 1506. (History of Benevento, in 3 vols. 4to; De Cruce Vieltiera Commentario, Roma, 1780; Bassirittii in terra cotta dipinti in vari colori trovati nella città di Velletri, Roma, 1875; Storia della città di Todi; De Cruce Vieltiere.)

BORGNE, LAKE. (Mississippi.)

BORGGO, an Italian apppellative, which occurs in the name of several towns, as Borgo San Donnino, Borgo Tar, &c. Borgo is a word of Teutonic origin, ‘burb,’ which is applied in Italy, as it frequently is in France, to a small hamlet or farmstead. In the old charters of the German frontiers of the empire to signify an assemblage of houses not enclosed by walls, Burgus or Burgum. It was afterwards applied to the fortified villages of the German soldiers in the service of Rome. Vegetius (lib. 4, c. 10) calls Burgus Castellum Parvulum. The Germans, in their invasions of Italy, introduced the appellation into that country, where it was generally applied to the houses and streets built outside of the gates of a walled town, corresponding to the Roman suburbia. The French faubourg, was at first applied to a set of houses and gardens near a river, as that of the Seine called la faubourg Saint-Germain, or Burrihiisburg, a ‘burb outside of the town.’ Several districts in the Italian cities have retained their original name of Borgo, although they are now enclosed within the walls. The district of Rome which is between the bridge of San Giovaani, and the church of San Domenico, is called Borgo, and there are several districts at Florence called Borgo, as Borgo dei Pinti, because they were originally outside of the city walls. There are however also towns standing by themselves which have the name of Borgo, and were colonies built by the citizens of some neighbouring town. (For example, Borgo S. Giovanni in the beginning of the thirteenth century,) or they were originally small assemblages of houses built near the castle of some feudal lord, which have gradually become towns after the castle had disappeared. (Molin.)

Borgo San Donnino, between Parma and Piacenza, formerly a feudal castle of the house of Pallavicini, is now a town of 5000 inhabitants, with some fine buildings and an old cathedral. It is the chief town of the province of the same name, and a bishopric; has a secondary school or college with forty-five boarders, two elementary schools for boys, and several manufactures.

Borgo Tar is a small town also in the duchy of Parma, situated in the Apennines near the sources of the river Taro, and about 30 miles from Parma. It contains about 2000 inhabitants, a secondary school with twenty-five boarders, and a seminary. A mountain road, practicable only for mules, leads from Borgo Tar to the Apennines by the village of Contecrocio to Chiavari in the Rivers of Apennines. The castle of Compianno near Borgo Tar was one of the state prisons of the French empire under Napoleon.
Borgo San Sepolcro, a town of the province of Arezzo in Tuscany, in the valley of the upper Tiber, and close upon the frontiers of the papal state. It originated in the tenth century with two pilgrims, who having been to Pales-
tine, brought a piece of the stone of the Sepulchre of Holy Sepulchre, and built a basilica near his spot. The fame of their sanctity attracted many people, and a number of houses were built, to which the name of Borgo San Sepolcro was given. The town was enclosed by walls, and, after long retaining its municipal independence, submitted in the sixteenth century to Cosimo I., grand duke of Tuscany, and became a bishop's see, and has several churches, besides the cathedral, with good paintings, and a seminary for clerical students.

There are other cities in Italy called Borgo, such as Borgo San Dalmazio near Cuneo in Piedmont, 3000 inhabitants; Borgo Sosia in the province of Abetone, with 2500; Borgo Vecchel in the province of Novara, with 2000; Borgo d'Alben in the province of Verceil, with 2400; Borgomaro in the province of Novara, with 6000.

There are several places called Borgoetto, 'small Borgo,' in the papal state.

BORGOGNO/NE, JACOPO CORTE/SI, called from his place of birth Borgognone, was born in 1621 in the city of St. Hippolyte, in Berry country (Italy). Borgognone, his real name, Giovanni Cortesi, was a painter of sacred subjects, and very successful in his way. Owing to an accidental temptation, Jacopo went into the army for three years; after which he returned to his art, and studied at Bologna, where Guido, then in his prime, was his master. His works were soon noticed, and he was sent to Rome, with permission to see a picture of his in a window, inquired into his circumstances, and took him home with him; which, during the remaining six months that he stayed in Bologna, afforded him a fine opportunity of improving his colouring. Here he stayed two years. He returned to Florence, and, among other things, he learned this maxim, 'That a painter, before setting to work on any subject, should recall to mind something which he had seen in reality: a saying which Jacopo kept constantly in view. Baldinucci, having invited him to his house many times, wanted to know which picture he had purchased, and asked him in a burst of admiration, 'How had he given his battles so much truth, with expression so just, and accidents so various?'—he replied, that all he had painted he had really seen.

Borgognone subsequently realized a handsome independence, and visited his native country for three years, but returned to Italy, and painted for a considerable time in Florence with great reputation. In 1653 he conceived himself under a call to renounce the vanities of the world, and to enter the monastic order, which he begged to be admitted into the order of Jesus, and was received as a novice. His feelings were undoubtedly modified by early association and the kindness he had met with from religious orders. During his noviciate he painted, at the suggestion of the director, several pictures, in subject-study, but which, which, though he had purchased, asked him in a burst of admiration, 'How had he given his battles so much truth, with expression so just, and accidents so various?'—he replied, that all he had painted he had really seen.

Borgognone subsequently realized a handsome independence, and visited his native country for three years, but returned to Italy, and painted for a considerable time in Florence with great reputation. In 1653 he conceived himself under a call to renounce the vanities of the world, and to enter the monastic order, which he begged to be admitted into the order of Jesus, and was received as a novice. His feelings were undoubtedly modified by early association and the kindness he had met with from religious orders. During his noviciate he painted, at the suggestion of the director, several pictures, in subject-study, but which, which, though he had purchased, asked him in a burst of admiration, 'How had he given his battles so much truth, with expression so just, and accidents so various?'—he replied, that all he had painted he had really seen.

As he painted with great facility and rapidity, his pictures are very numerous. His execution was in dashing strokes, these pictures being painted, as he further states, 'from a close view, a manner which has been ascribed to his living with Guido, and to his seeing the works of Paolo Veronese when at Venice; but partly ascribable perhaps to his habit of sketching before he was thoroughly practised in the art. His pictures have excellencies corresponding to the peculiarities of his style. 'If,' says one of his biographers, 'they do not convey sounds, they express with horror to the mind the cries of the bulletting soldiers, the shrieks of the women, the groans of the dying soldiers, the shrieking of the bombarding, the bursting of mines,' and truly there is a freedom of design, a force and suddenness in the action, a unity of composition, with a most natural variety in the accidents, which seem to show the gallery-visitor a real battle-field.

Jacopo had a brother, Guglielmo Cortesi, also called Borgognone, a painter of merit, who sometimes assisted his brother in his paintings, but he never attained the same emi-

No. 295. [THE PENNY CYCLOPAEDIA.] Vol. V. 201 B.
Cornwall,' fol. Oxford, 1754. It passed through a second edition at London in 1769. It was at the request of Dr. Lytton that his memoir on the Scilly Islands was published as a distinct treatise in an enlarged form, entitled 'Observations on the Antient and Present State of the Islands of Scilly, and their importance to the Trade of Great Britain,' in connexion with Mr. Charlez Lyttelton, LL.D., dean of Exeter, 4to. Ox. 1756.

Mr. Borlase printed at the Oxford press his 'Natural History of Cornwall,' for which he had been many years making collections; it was published in folio in April, 1758. He possessed a variety of fossils and remains of antiquities, which he had described in his works, to the Ashmolean Museum, to which he continued to send every thing curious that fell in his way. In 1766 the University of Oxford conferred upon him the degree of L.L.D. by diploma.

Borlase paid no scanty attention to his pastoral duties and the study of the scriptures. He made a paraphrase of the books of Job and the books of Solomon, and wrote some other pieces of a religious kind. He occupied himself in superintending his parish, and particularly the improvement of the high roads, which were more numerous than in any parish in Cornwall. The belles-lettres and painting also formed part of his amusements. The correction and enlargment of his History of Cornwall for a second edition engaged some part of his time, and which he thought well to mention in his 'Memoir of History.' His 'Private Thoughts concerning the Creation and Deluge,' after being sent to the printer, were recalled when a few pages were printed, chiefly owing to his severe illness in Jan. 1771. From this time his health began to decline. He died Aug. 31st, 1775, in his seventy-seventh year.

Dr. Borlase corresponded with many of the most eminent men of his time. Nichols, in his 'Literary Anecdotes of the Eighteenth Century,' says that there is still extant a large number of letters written to Dr. Borlase by Mr. Pope, whom he furnished with the greatest part of the materials for forming his grotto at Twickenham, consisting of such curious fossils as the county of Cornwall abounds with. Dr. Borlase's name in capitals composed of crystals is the sole ornament of one of his invitations, a piece of lettering written to the doctor by Pope, in which he says, 'I am much obliged to you for your valuable collection of Cornish diamonds. I have placed them where they may best represent yourself, in a shade, but shining.' (See Dr. Borlase's 'Life of himself,' printed with Additions, in Nichols's Literary Anecdotes of the Eighteenth Century, vol. v. p. 291-303; Biog. Brit. Hippis's edition; and Chalmers's Biog. Dict. vol. vi. p. 119-122.)

BORMIO, a town in the prov. of Sandrio in the Lombard Isthmus, 830 m. near the sources of the Adda, and at the foot of the Rhetian Alps. The great Ortler-Spitze, one of the highest summits of the Alps, rises near Bormio. The new road over the Stiffer Joch, or Mount Stelvio as the Italians call it, passes round the N. W. flank of this never-sleeping church, and the Austrian government in 1819 and finished in 1825, forms the direct communication between Milan and the Tyrol, leading from Bormio in the valley of the Adda to Giuroens in that of the upper Enz (Adige), and from thence to Innsbruck, 11 hours by road of 300 m., and 2 hours on the Stiffer Joch is 9000 ft. above the sea, and consequently considerably higher than any of the other roads over the Alps into Italy. The road is wide and the ascent easy. It is well secured by parapets on the side of the precipices ever since 1799, when it was partly burnt by the French, but the opening of the new road has removed this perilous activity. The country around is not productive, and the climate is cold; but it has good pastures. Some barley and rye and excellent honey are the principal productions. Bormio contains some good paintings by Canelino, a native of this place. The mineral-water baths of San Martino near Bormio are frequently visited by invalids from the Tyrol and the Valtellina, but the accommodations are bad. In the Valfurva, E. of Bormio, is the chalybeate spring of Santa Caterina, which is also in great repute. There is a rich iron mine in the same neighbourhood.

Borneo, called by the Germans Wosado, was the head town of the delicious island of Savo, from which it was taken by Bonaparte in 1796, together with the neighbouring Valtellina and Chiavenna, and annexed to Lombardy. For the road of the Stiffer Joch see Latrié's Pejserian Tour, and Mersey, Le Tyrol et le Nord de l'Allemagne.

BORNEO is the largest island in the Indian Archipelago, and the largest in the globe, if we except the continent of Australia. It occupies the centre of the Indian Archipelago, and is divided by the equator into two nearly equal parts. The north-western part is only a little more than four degrees S. of the equator, and the most northern, Cape Sampanmannang, extends a few minutes to the north of 7° N. lat. The most eastern extremity, Cape Konneeooeg, reaches nearly 119° 30' E. long.; and the most western shore, about one degree N. of the equator, is in 105° 30' E. long.

The seas which enclose Borneo are portions of the Indian Ocean, but being for the most part separated from one another by chains of islands and united by straits, particular remarks have been made on their respective characteristics. The sea between Java and the islands to the east of it, on one side, and Borneo on the other, is called the sea of Java or Sunda; the latter name comes from the straits of Sunda, which divide Java from Sumatra, and afford the safest and most direct communication by sea from India to China.

The Java sea is divided from the southern portion of the China sea, which encloses the western and northern shores of Borneo, by the islands of Banca and Billiton, and united to it by the straits of Banca and Billiton and the Carinima Passegan, which separate the Casamano shore from Billiton island. The China sea affords the safest passage to China, being in its centre and along the shores of Cochin China comparatively free from rocks and islands. To the east of Borneo extend the Mindoro sea, the sea of SOOLO or Celebes, and the sea of Palawan. The Mindoro sea is drained by the China sea by the large island of Palawan and the smaller islands of Calamianes and Busavagon; Busavagon is separated from the island of Mindoro by the straits of Mindoro. The sea of Celebes is separated from the sea of Mindoro by an extensive chain of islands called the Sooloo Islands. The straits of Macassar unite the sea of Celebes with the Java sea, and divide Borneo from Celebes.

The greatest length of Borneo, from Cape Sambar, the most S.W. point, to Cape Sampanmannang at its most N.E. point, is 830 m.; 104° 30' of latitude; 36° of longitude. The Casamano passage is about 850 m. wide at its parallel of Cape Konneeooeg 660 m., and the surface of the whole island is estimated by Walter Hamilton at 262,500 sq. m. But this is evidently somewhat below the mark, for if we consider that the portion of the island which lies to the south of 2° 30' S. lat. 119° 30' E. long. has an altitude of 24° 30' of latitude, and 24° 30' of longitude, and a breadth of 450 m., it gives an area of nearly 250,000 sq. m. To this must be added that portion which runs in the shape of a peninsula to the N.E. from 2° 30' S. lat. to Cape Sampanmannang, which with an average width of 120 m. has an area of 50,000 sq. m. To this must be added 300,000 sq. m. To the eastwards of 36,000 m. The whole surface may therefore be about 286,000 sq. m., or nearly twice the area of the British Islands, and one-half that area besides.

None of the large islands, except New Guinea, are less known to Europeans than Borneo. But the Dutch have had an establishment on its S. coast for upwards of half a century. This circumstance is doubtless owing to its peculiar figure, which is one mass of continuous land, without any considerable indentation. Our knowledge of this island is limited to the shores, a few harbours and mouths of the rivers, and to the country a short distance inland from them. The eastern shores south of Cape Konneeooeg, the whole extent of the southern shores, and the western up to Cape Dattu, are low, and for above thirty miles inland marshy. This is free from alluvial deposits, but alluvial marshes border the island. The coast which runs in a N.E. direction from Cape Dattu to Cape Sampanmannang is seldom visited by European vessels, on account of the perilous navigation among the numerous islets and rocks which line it to a considerable distance from the shore. This fact leads us to suppose that it is rocky; which is certainly the case with the north-
eastern peninsula from the neighbourhood of Cape Sampanmaggio as far as Cape Koneeocogan. This peninsula is a little known. Till lately it was supposed that it was covered with extensive ranges of mountains of considerable height, but this supposition has not been confirmed by the Dutch expedition, which was undertaken in 1823 from the western shores of the peninsula to the eastern, a distance of about 300 miles. The expedition, it is said, advanced about 300 miles inland without meeting with such obstacles as mountains would have opposed to their progress. But the north-easterly portion of the island is known to contain mountains which rise to a considerable elevation. The rivers are numerous and of considerable size at their outlets, but their length is not known, as none of their sources have been visited. They are commonly navigated fifty miles and upwards from their mouths, but not farther, which may lead us to conjecture that the distance from the coast the land has a considerable rise. The largest rivers seem to be the Benjarmassin and Borneo on the southern coast, the Pontianak and the Sambas on the western; another Borneo on the north-western, and the Passir on the eastern. It is probable that the island contains some considerable lakes, and it is remarkable that here, as in the peninsula without the Ganges, the natives assign an extensive lake as the common source of all the large rivers. Towards the northern extremity, and at no great distance from Cape Sambas, Mons. de Koninghich found a lake which seemed to be 100 miles in circumference, with an average depth from five to six fathoms. The Dutch, in their late expedition, came also to a large lake, called Danao Malayu, which extends from twenty-five to thirty miles in length, with an average breadth of above twelve. But its situation is not yet known with sufficient accuracy to be laid down on the maps.

The climate of this island, as far as it is known, is very hot and moist, owing to the extensive marshes along the coastal shores, which extend far inland in the northern part of the country at the north-eastern extremity. It is particularly destructive to Europeans. In the districts situated on the western shores the wet season takes place during the south-east monsoon, from April to September; but on the northern shores, along the coast of Macasar, and in the Java sea, it begins with the north-west monsoon, from October to April. The average summer-heat is vaguely estimated at 84° Fahrenheit. A country with a good soil and abundance of moisture, situated under the equator, must be extremely rich in vegetable produce.

Most, if not all, of the tribes inhabiting Borneo cultivate the ground. Rice (oryza sativa), being the chief article of food over nearly the whole of the island except the eastern coast, is principally cultivated. Where the land can be floated with water the horticulture of Borneo is carried on to great advantage. Some rice cultivation does not depend on the seasons, and therefore within the compass of a few acres rice may be seen in every state of progress. In one little field, or rather compartment, the husbandman is ploughing or harrowing; in a second he is sowing; in a third transplanting; in a fourth the grain is beginning to flower; in a fifth it is yellow; and in the sixth the women, children, and old men are busy reaping. It yields twenty-five to thirty-fold of the seed. Maize (Zea Mais), which yields a hundred-fold, is not much cultivated. All sorts of lentils and beans are raised. The roots of which cultivated especially yams (Dioscorea alata), of which they grow many varieties, which are planted in the poorer districts, sweet potatoes or batatas, the kantang (Oxymum Tuberum), the mandioca (latropha embon), and a species of dioscorea (D. t Rickhla), which they call gadang, and which also grows wild in every part of the island. The Arum esculentum, Lin., is cultivated in the upland soils.

The culinary plants most extensively cultivated are the umbrella palm (Caryota urens), and the nipah (Cocos nypa), of which the former is the true cabbage-tree. The teak is not found in Borneo, and the common timber-trees are the...
bitanger, a species of uvaria, the marboa (Metrosideros),
the pinaya, and the surreu. Other trees are used for cabinet
or fine work, but most of them have not yet found a place
in our botanical catalogues. The forests of Borneo contain
many trees which yield gums or resins useful in the arts.
The most important of these products is the camphor tree,
a small tree yielding a kind of balsam, which exudes sponta-
neously from the pine-trees of that name through the bark, and
is either used adhering to the trunk and branches in large
humps, or in masses on the ground under the trees. It is
used for all purposes to which we apply pitch, but chiefly on
the bottoms of ships and vessels. Resins are exported in large
quantities to the continent of India, especially to Bengal
and China. In different districts vines or trailing plants
grow, the milky juices of which form, when inspissated, a
trusting food.

Plants which yield dyeing materials are numerous. Indigo,
the most important and valuable, grows wild, and is also
cultivated. Next to it the safflower (Carthamus tinctorius)
deserves notice, and then the arto (Bixa Orellana). Tur-
meric (Curcuma armena, L.) is cultivated to a considerable
extent, but less used for dye than as an aromatic for
seasoning food. Dyeing woods are the sappan, or Brazil wood
(Casaurinopsis Sappan), but it is less esteemed than that of
Luconia or Sumbawa. The root of the mangkudu (Morinda)
is extensively employed as a dyes for all purposes.

The pepper-corn tree (Una, or Piper Betel) is also found in
the forests of Borneo, and its inner bark is used by the natives
for wearing apparel.

The sugar-cane is indigenous, and extensively cultivated
by the natives, and still more by the Chinese. Cacao, the
nutmeg-tree (Piper nigrum, Linn.) is cultivated, but grow also
in a wild state, and their product forms a considerable article of
exportation. There are also some species of nutmeg-trees, but
their produce is not equal to that brought from the Banda islands.

The cashew nut (Leucaena Linn.) yields the cove-barck,
name is derived from the resemblance of its taste and frag-
rance to that of the cowl: this bark is exported to China.

The cayapau (Melaleuca leucodendron), which in less warm
climates is only a shrub, here becomes a tree, and yields a
rank and elegant species of paper. The cinnamon is not found
here, but the cassia-tree is common, especially in the northern
districts. Ginger is widely diffused, and in general very useful among the natives, but
in quality it is inferior to that of Malabar or Bengal.

Among the most remarkable vegetable productions of
Borneo and the adjacent island of Sumatra is the camphor
tree (Dryobalanops camphora, Celebr.). It is found no
where in the world but in these two islands, and even here not
on the coast, or the site of the line, nor beyond the third degree of
N. lat. It is a large tree, and grows to 150 feet in height. It is
an object of cultivation, and the gum is obtained by
making incisions in the bark; the greatest part of the
product is exported to Mohammedan and Catholic countries.
The inner cell of aquila wood, eagle wood, or lignum
aegis, is collected in sheets of the wood of the same.

The elephant inhabits only the north-eastern parts of
the island, especially the peninsula of Unsung, the most
northern part of the globe where this animal is found; the
rhinoceros also is said to exist here. The royal tiger is not
known to live in this island, and when seen in the distant
districts, it is supposed to have crossed the summit of the range. It
is an object of cultivation, and the gum is obtained by
making incisions in the bark; the greatest part of the
product is exported to Mohammedan and Catholic countries.
The inner cell of aquila wood, eagle wood, or lignum
aegis, is collected in sheets of the wood of the same.

Of domestic animals only horned cattle and hogs are
numerous. There are not sheep nor asses, and horses seem
not to be common. The flesh of the buffaloes, and with
the hogs and hides sent to China, the latter always in the hair
and not tanned. Common fowl and ducks abound
in most places.

Among the numerous birds the most remarkable is the
hirundo esculenta, whose nests are carried to China, and
fetched an enormous price. This bird however is only found

on the north-eastern extremity of the peninsula of Unsung
and its neighbourhood.

Both sea and river fish abound, particularly the former.
The waters which surround this and the neighbouring islands
are so tranquil, and the numerous banks afford the fish upon
the surface to swim in shoals. The greatest abundance of
better supply of fine fish, especially where the shores are flat.
The edible fish are here very numerous, among which the
pomfret, the eel, and the sole are the most delicate. A
very great variety of fish are dried in the sun, and form a consider-
able part of the articles of exchange; the fish of Borneo is an article of
universal consumption among the Indian islanders as fish in
cold countries. Some kinds of fish, especially ahrimips, are
reduced to a state half pickled and half putrid, and form an article of
internal commerce under the name of blanchet. But the
trout, the cusk, or the asp (Caspium), is a valuable article
of exportation to China. This animal is only found among the rocks which line the north-western and
northern coasts of Borneo, and extends hence eastward
New Guinea, and southward to the north-eastern shores
of Australia, where the sea is dotted with numerous coral
reefs. Besides the tripango, fish maws and shark's fins are
also exported to China, where they are considered very
delicate. Tortoises are very abundant, especially
on the northern and north-eastern coast. Those found
farther south are smaller, and less valuable, and are chiefly
Tortoises-shells are exported to China, whence many of them
find their way to Europe, on account of their low price.

The lane is found in the forests, but as its produce is
inferior to that of Bengal and Burmah it forms only an incon-
considerable article of trade. Bees abound here, as all over
Southern Asia, but only in a wild state. They make a
honey, and great quantities of wax, which is exported
to China.

The mineral riches of Borneo are little known. Iron
is found in the southern part. Copper has of late been dis-
covered, and worked in Sambas, on the western coast. Silver
deposits are only known united with gold; but antiquity is plea-
sant in Selangor. Sarawak is an eastern coast of the island.

The inhabitants of Borneo are either aborigines or for-
igners. The former are divided into a great number of tribes. The Dayaks occupy the southern
districts, the Biajoos and Itana the peninsula extending to
the north-east, and the Tiroon live on the coast of the

In the interior are the Kayan, the Duanun, the Marut, the Ta-
aceli, &c., but they are not farther known. It does not seem
that any people is universally acknowledged to possess a
language different from that of the aborigines of the South.

All the inhabitants, with the exception of the two last
named, belong to one race, which is called the Malay race.
Their persons are in general rather slender than handsome. The face is of a round
form, the mouth wide, the chin somewhat square, the cheek-
bones are prominent, and the cheek consequently rather hollow; the nose short and small, never prominent, but
never flat; the eyes are small, and always black; the com-
plexion is generally swarthy. The women of the different
tribes, the Dayacks inhabiting the interior of the island
being fairer than those of the coast; the hair is long, lank,
harsh, and always black. The languages of the different
aboriginal tribes differ widely from one another, and they
have no literature, though some of the foreign settlers,
as the Javanese and Bugis, have cultivated their languages,
and have many books written in them.

The aboriginal tribes have not attained a high degree of
civilization. Agriculture however seems generally diffused
through the islands, and the presence of gold is
very common. They cultivate chiefly rice, and collect gold-dust and
diamonds. They trade also in rattans, dammar, and other pro-
ducts of their forests. Their dress consists only of a small
wrapper round their loins. Their houses are wooden build-
ings, often large enough to contain upwards of 100 persons
in the construction of their boats and some of their utensils
they display considerable ingenuity. These tribes, though otherwise mildly and simple, are cannibals, or at least some of them are. They kill their prisoners, and eat their flesh. About these are the swarms of ants, which swarm about the piles round their habitations, and in some a youth is not entitled to a wife until he has produced the head of a man. Some devour the heart of an enemy when they have killed him. Some who live on the coast have embraced the Musulman faith, which is called the religion of the Moors. Polygamy is in general use among those who are able to maintain many wives and large families. One part of the Biajooos inhabits the north-western coast, but another lends a maritime life, and may be considered as sea-gypsies, or islanders living on the coast of Sumatra. They have shifted to leeward from island to island with the variations of the monsoons. Their fishing-boats, in which they live with their whole families, are about five tons burden, and their principal occupation is the catching of the sea-slug, for which they frequently dive in seven or eight fathoms water.

The number of the Chinese settlers is considerable. In every part of the island some families are found near the mouths and on the banks of the rivers. They follow the occupations of merchants, mechanics, and labourers; cultivate the ground, distil sakè, make sugar, search for gold-dust, and trade to the interior as well as on the coast. They are not rich, but too fond of good living, and addicted to gambling, opium, and merry-making.

The people from the island of Celebes, are remarkable among the nations of Southern Asia for their industry and activity. They chiefly apply themselves to trade, to manufactures of Bugis cloth, and the working of raw silk into cloth. Many of them are possessed of property amounting to above 100,000 dollars. They are generally poor when they come from Bugisland, but they are extremely economical and even penurious in their manner of living. The daily expenses of a Bugman's family, however great his property may be, does not amount to above three or four sous; when the nearest Chinese labourer will contrive to spend a rupee, and a wagon is only the twelfth part of a rupee. These Bugis are very active seamen, and visit all the islands and countries round Borneo. Their small vessels, or proas, generally cost from 150 to 300 dollars; and the whole outfit, as far as respects sails, cordage, provisions, stores, &c., for one of their voyages seldom exceeds the sum of forty or fifty dollars, while the value of the cargo is generally from 20,000 to 40,000 dollars. The crew receive no wages, but only a share of the adventure, according to country practice. Some proas are wrecked at sea; but few are taken by pirates, as the men defend themselves desperately and never surrender. More than a hundred come annually to the harbour of Singapore.

The Malays are the most numerous of the foreign settlers. They occupy nearly the whole coast, only an enclaves being left by the Dayaks. Though rather indolent they are not deficient in military spirit, and have formed a great number of small states, and subjected the aborigines. But these petty sovereigns are not absolute, their power being limited by a state-council and a nobility.

The only European nation that has hitherto permanently settled on this island is the Dutch, who have got possession of about one third of the coast, and extended their dominion far inland in some places, so that the rich gold and diamond mines are in their possession. All the Dutch settle natives, and are particularly numerous among the Dayaks, and they govern the territories of the sovereigns of Banjarmassin, Sucadana, Pontianak, Mampawa, Sambas, and Matan, and of some other farther inland. This great tract of country is governed by three residences, established at Banjarmassin, Pontianak, and Sambas, with two subordinate residences at Mampawa and Landak.

In the territories possessed by the Dutch there are two places of considerable trade, Banjarmassin and Pontianak. Gold is found at six different places, at Ombak, Sanga, Landak, Pontianak, Sambas, and Mampawa; but especially at the two latter places. The metal is found in alluvial deposits, which are channelled by the beds of numerous rivers, and the situation of the gold is generally very superficial, not usually above five or six feet from the surface. The Dutch government has possessed itself of the mines, which contains it. The ore is in general very rich, containing in a hundred parts, rarely more than fourteen, and frequently only three parts of dross, but a small quantity of silver is always combined with it. According to the calculation of Crawford the annual produce of the mines of Borneo is 88,362 ounces: Eschewege, in his "Pluto" gives a production of 90,362 ounces of gold from the mines of Brazil as not exceeding 8000 marks, or 64,000 ounces.

The diamonds are found in the territories of the princes of Banjarmassin and Pontianak. The principal mines are at a place called Landak, whence the diamonds of Borneo are called Landak diamonds. The polished diamonds of Borneo are not found here, as in Brazil, in the rivers, but they are dug by means of perpendicular and lateral shafts. The mines are only wrought by the Dayaks, but those of gold are mostly worked by the Chinese. The Bugis resident merchants are the great dealers in diamonds. In this island there is only a few of the largest diamonds in the world; it is either in the hands of the Prince of Matan, or in the possession of the Prince of Pontianak. It weighs 367 carats, and its real value, according to Crawford, is 269,578l., which is 34,822l. less than that of the Rutli diamond, and 119,774l. 10s. more than that of the Pitt diamond.

To the north coast of the territories of the princes dependant on the Dutch, and along the north-west coast, extends the kingdom of Borneo Proper. It is not well known at what point on the coast its south-western boundary lies, but towards the north-east it extends to the mouth of the river Kimanis, which is traversed by the 11th parallel. It consequently contains a sea-coast of between 600 and 700 miles, and is said to extend from 100 to 150 miles towards the interior. The coast is well known; the approach to the coast is very dangerous for vessels of considerable burden, and it is rarely visited by Europeans. Still the intercourse between Borneo Proper and Singapore is greater than with any other part of the island, not only as it is employed on by Bugis merchants and Dutch navigators. The capital is Borneo. From Sialang, towards its western frontier, great quantities of antimony are brought to Singapore. The mountain which contains the antimony is about one day's journey from the coast. The sultan, as well as a considerable portion of the population, are Malays.

The north-eastern part of the island is under the sultan of the Sooloo Islands: it extends from the river Kimainis on the north-west coast as far as Cape Kotimooman, which forms the eastern boundary of the Straits of Macassar. This part also is rarely visited and little known. The inhabitants, the Tironos, are notorious pirates, like the Sooloo islanders, and they cruise especially in the seas of Mindoro and Celebes, and among the Philippines. Their principal traffic is in spices and pepper. The Sumatran coast is open to the Chinese, who seem to have the whole commerce of this coast in their hands. There is no important trading place on this coast. At the Island of Balambangan, opposite Cape Sampanmangkia, the English had formerly a settlement, but that has been abandoned.

The coast extending from Cape Konneecongan to Cape Salagat seems to be divided among a great number of petty sovereigns, and here the aboriginal tribes are still in possession of the sea-shores. Its commerce however is chiefly carried on by the Bugis, who have settled on different places along the coast, but especially at Pasar, a town of some note, which is sometimes visited by European vessels.

The commercial intercourse of Borneo with China is much more extensive than with Europe, which is partly due to the great distance of the Chinese who have settled on this island, and still more to the circumstance of many of its productions being either entirely unfit for European markets, or too high-priced. To the first class belong the edible swallow-nests, the sea-slugs, and the wild woods; to the second the camphor. The Chinese ports with which this commerce is conducted are Canton, Amoy, Ningpo and Shanghaeghe. It is remarkable, that the Chinese junkes, though unarmed, pass un molested through these seas, where European vessels are in continual danger of being attacked by the numerous pirates.

Among the European nations the Dutch, who exercise authority over one-third of the coast, carry on a most active commerce, exporting pepper, gold, and other products. But the commercial intercourse with Singapore is far from being inconsiderable, as upwards of forty vessels annually go there from this coast. (Dr. Leyden's Description of Borneo in the Asiatic Journ.; Crawford's History of the Indian Archipelago; Asiatic Journal; Stavorinus' Voyages).
BORNEO, the capital of the kingdom of Borneo Proper, or Brunei, is situated on the north-western coast of the Island of Borneo, 4° 56' N. lat. and 114° 44' E. long., on the banks of a river, about ten miles from the sea. The mouths of the rivers, and low ground on both sides of the river, contains a considerable number of houses, built on posts four or five feet high, which, at the rise of the tides, allow the water freely to pass under them. The streets are formed by canals, either natural or artificial, which facilitate communication, and they are always covered with boats, which are managed by women with great dexterity.

Borneo is a place of considerable trade. Its commerce was principally limited to its intercourse with China, the Philippines and the South China coast; but the introduction of Malacca, not being much frequented by the Borneo navigators. But since the foundation of Singapore, the Bugis merchants of Borneo often visit that port. The exports are rice, black pepper, camphor, cinnamon—bees' wax, sea-slug, turtle-shell, pearls, and mother-of-pearl, with tea, wrought and raw silk, and nankeen, the three last articles being imported from China. At Singapore they take in exchange cottons and woollens, opium, iron, arms, and ammunition. This port is rarely visited by European vessels, but many Chinese junks frequent it. At Singapore, the Chinese sell their goods in the neighborhood of the Hill of the Nanny. The Chinese find it advantageous to build their junks here, for though the island has no teak, it produces other kinds of good ship-timber, among which is the camphor-tree. (Dr. Leyden's description of Borneo in the Annals of the Indies.)

BORNEW, a town and commune in the province of Anjou, about 12 m. W. from Mechin, and 10 m. S.W. of Antwerp. The commune is bounded on the N. and the W. by the Scheldt, which separates it from East Flanders. The town contains 594 houses and 4043 inhabitants, among whom are 121 births and 233 deaths. The church is dedicated to St. Martin. There are 237 boys and 103 girls who were taught in 1833. The principal trade of the place is in corn, flax, and linen cloth, considerable quantities of which are made there. In cutting a sluce, in 1781, a great number of Roman bronze medals were found, thirty feet below the surface, and seven or eight feet below the level of the Scheldt. These medals were of the emperors Commodus and Caracalla.

Rupel having, in February, 1825, forced down the dyke of the Scheldt, the port of the commune of Bornem was overflowed, so that nearly all the inhabitants were obliged to abandon their houses, and were unable to return to them for two months. (Dict. Géog. de Anciennes et Modernes, par Van der Maelen.)

BORNMOLM, a town and parish attached to the Danish province of Seeland, is situated in the Batliz, 90 m. E. of the island of Seeland, about 40 m. E. by S. of Ystad on the coast of Sweden, and about 50 from the N.E. shores of the Russian island of Rügen. It is about 32 m. in length from N. to S., and varies from 9 to 12 m. in breadth, except at the N. extremity; inclusive of three islands, it contains an area of about 216 sq. m. Bornholm presents a great variety of the wide range of the whole islands. The coast of Bornholm is for it is not only a complete rock, but more especially in the interior, particularly towards the N.; and it is so walled in by precipitous cliffs and dangerous reefs, that at certain seasons of the year, the approach to it is extremely hazardous. The island, besides the island and the coast of Pomerania is dangerous to vessels that draw much water, arising mainly from the shifting sand-bank called the 'Dueodde or Pigeon's Point. A high range which stretches across Bornholm from N. to S., called the 'Almdinge,' which is 67 yds. lower, the highest part of the island, is about 55° 6' N. lat., and 14° 44' E. long. The next town of importance is Nexø, on the S.E. coast; it is situated upon an elevated mass of rocks, possesses a good harbour and roadstead, a church, charity-school, hospital, and public storehouse. The island is rich in natural resources; the island and the coast abound with fish, notably salmon, halibut, and small-sized herrings. Bornholm is rich in mineral productions; coal is partially raised for domestic use; quarries of sandstone and millstones are worked; and there is also marble, slate, and pottery-earth.

The inhabitants of Bornholm, about 20,000 in number (in 1801 18,902), are wholly of Danish extraction; they are a remarkably industrious race, quick in temperament, enterprising, and sober, and make good sailors, though rough and somewhat perverse. They speak a peculiar dialect of the Danish mixed with German words; and are expert in the manufacture of woollens, pottery, and clocks and watches, the last mentioned being made in the towns. General comfort prevails throughout Bornholm; the farmers are the owners of the lands they cultivate. It is the duty of every household to be provided with a smoke for the youngest son, but, on the failure of male issue, the eldest daughter, not the youngest, inherits them. Among other privileges which the Bornholmers enjoy are those of paying only half the taxes imposed on their fellow subjects, and providing for the defence of the island out of their own resources. The military force, which is confined to natives, and cannot be removed out of the island, is composed of two companies of artillery, four squadrons of dragoons, four companies of regular infantry, a company of riflemen, and eleven companies of civic and provincial militia.

Bornholm is divided into four districts or 'härds,' the northern, western, southern, and eastern, and contains twenty-one parishes, five towns, two hamlets, and 948 farming establishments; the last stand wholly isolated, nor are there any regular villages throughout the island. Though there is but one public school, most of the inhabitants are able to read and write.

In very remote ages Bornholm belonged to Denmark, but in the sixteenth century it was made over to the citizens of Lubeck. In 1665 it was ceded to Sweden, who retained possession of it by the subsequent treaty of Roskild; in 1658 however the inhabitants rose against their new masters, under the conduct of Jens Korfoed, and having declared their island an heir-loom of their country, Bornholm, it has ever since maintained its allegiance to it.

The chief town of Bornholm lies on a high flat on the W. coast, and is called Rönne, Rönmedy, or Rottum. It is an open place, irregularly built, and has a singular appearance in consequence of the walls of the houses being whitewashed, and the woodwork being smeared with tar. The castle, now reduced to an old tower, is all that is left of the fortifications raised in the times of Christian V.; they have been superseded by batteries of modern construction. There are three churches, a grammar-school, town hall, arsenal, and hospital, seventy streets, nearly 600 houses, and about 2800 inhabitants, who subsist by trade in grain, making clocks and watches and pottery-ware, and upon the produce of their fisheries, their trade with the interior and foreign parts, and their navigation. The harbour is small, and varies in depth from 6 to 9 ft. the first mentioned being the more general depth; but it affords a safe anchorage against most winds. It is the seat of government, and the residence of the high executive power, and it is situated on a flat bank of land 55° 6' N. lat., and 14° 44' E. long. The next town of importance is Nexø, on the S.E. coast; it is situated upon an elevated mass of rocks, possesses a good harbour and roadstead, a church, charity-school, hospital, and public storehouse. The island is rich in natural resources; the island and the coast abound with fish, notably salmon, halibut, and small-sized herrings. Bornholm is rich in mineral productions; coal is partially raised for domestic use; quarries of sandstone and millstones are worked, by the government.

The other towns are Askirkbye, in the interior, which is the seat of justice for the island, and has
A handsome black marble church, the finest in Bornholm, a hospital and public store, and about 460 inhabitants; Haeløe, on the W. coast, with an indifferent harbour and about 500 inhab. Svanike, on the eastern coast, lying in a small inlet, the whole small island with barrack, has a church, hospital, charity-school, and storehouse, and about 670 inhab.; and Sandvig, on the N.E. point of the island, a town which does not contain more than 50 houses, and about 200 inhab. Maltværn is said to contain 1400 pop. The three small islands or rocks of Christianøe, Frederiksholm, and Grisoholm, are about 17 m. E. of the N. point of Bornholm, and belong to the larger island. Christianøe and Frederiksholm are inhabited and fortified, and on Christianøe there is a lighthouse. The fisheries and the taking of sea-eggs are very productive. The pop., including the garrison, is about 500.

BORNOU, a kingdom situated nearly in the centre of North Africa, between the 10th and 15th parallels of N. lat., and from 12° to 18° E. long. It borders on the N. on the eastern portion of the great desert of Sahara, and partly also on the kingdom of Kanem, which extends on the N. banks of the lake Chad. This lake forms its E. boundary to the mouth of the Shary, and hence it runs along the course of this river, probably up to the place where it issues from the mountains of Mandara. The latter kingdom, which comprehends the northern declivity of an extensive range of primitive mountains, extends to the S. of Bornou, and on the W. lies the Falatah kingdom of Howssa.

The whole country presents nearly a perfect level, with a few small ridges described as desert mounts, which is so much above the neighbouring lake of Tchad, that in the rainy season great tracts of land along its banks are inundated, when both the inhabitants of the villages and the woods are compelled to retreat farther to the west. But even the remoter and more distant parts of the country are crossed by the slow rivers and rivulets which intersect the country being unable to carry off the immense supply of water during the rainy season; and thus extensive tracts which skirt their banks on both sides are covered with water, and remain thus for many months.

It does not appear that Bornou extends to the lower ranges of the Mandara Mountains, though these mountains are visible in the southern districts of the kingdom. The rivers are numerous, but have generally a short course, falling either into the Tchad, or into one of the two principal rivers, the Shary and the Yeou. The Shary has its source in the Mandara Mountains, and seems to form the boundary between Bornou and Begharmi, nearly the whole length of its course in the plains. Towards its mouth it divides into many affluent streams and rivulets, which are those nearest to the mouths of these branches are complete swamps, and unfit for agriculture even during the dry season. The Yeou river rises in the more hilly country of Howssa, near 10° E. long., where it is called Shooham, and after a course of 100 miles joins the Shary. The country mostly covered with low rocky hills, it runs for the remainder of its course, which in general is in an eastern direction, through the extensive plain of Bornou to the Tchad. This lake covers many thousand square miles, and contains many uninhabited islands. It extends from N.W. to S.E. about 200 m., but it has not yet been ascertained how far it extends to the N.E. It abound in fish.

The heat in Bornou is very great, but not uniform. The hottest season is from March to May, when there is no rain, and the thermometer sometimes rises to 105° and 107° at two o'clock in the afternoon. The prevailing winds of this season are from S. and S.E., and they are suffocating and scorching. In night the thermometer sometimes falls to 80° and 85°. This hot season is followed by violent thunder, lightning, and rain towards the middle of May, when the inhabitants prepare the ground for their corn. At the end of June the inundations of the rivers and lakes begin. The rains are then nearly continual, and the thermometer is hot and violent at the same time, and blow commonly from the E. and S. In October the rains become less frequent, the air is milder and more fresh, and the weather serene; breezes blow from the N.W., which is called the dry season; and in the beginning of January it begins to be cold, and in these months Bornou is colder than might be expected from its latitude. The thermometer never rises above 74° or 75°, and in the morning it descends to 58° and

69°. The prevailing winds in this season blow from the N. & N.W.

The only implement of agriculture is an ill shaped hoe, made from the iron found in the Mandara Mountains. All the labours of the field devolve almost entirely on women. The most valuable products of the country are cotton, indigo, of which the two last grow wild close to the Tchad and in the overflowed grounds. The indigo is of a superior quality, and the dark-blue colour of their tobes, or large shirts (the only dress the people wear), is probably not excelled in any part of the world. The cotton plante is also grown wild. Rice is not much cultivated, and what is raised is of inferior quality; considerable quantities are imported from Soudan. Very little wheat is grown, and barley is not abundant. The grain most used for bread for men and animals is a species of sorghum called gusseu, which is raised in considerable quantities, and prepared as food in different ways. The seed of a grass called kasheia, which grows wild in swampy places, is made into flour, or eaten like rice, when boiled. Bornou is almost entirely destitute of fruit-trees. Monkeys are only found in the southern districts near Mandara, and date-trees only to the N. of Woodie, four days N. of Kouka, and even there they are sickly, and produce an indifferent fruit.

The wealth of the inhabitants principally consists of slaves and cattle, the animals, especially bullocks and horses. Black cattle are most numerous. The Shouas on the banks of the Tchad have probably more than 20,000 heads, and those on the river Shary not less. They breed also many horses, and send to Soudan annually from 2000 to 3000, which they sell as they arrive, being very inferior. The other domestic animals are dogs, sheep, and goats. The common fowl is small but well flavoured, and reared in immense numbers. Bees and locusts are numerous; the latter are eaten by the natives with relish, both raw and boiled, and used as a paste. The beasts of burden are the bullock and the ass. There is a very fine breed of asses in the Mandara valleys. Camels are only used by foreigners or persons of rank.

The lion, the panther, a species of tiger-cat, the leopard, and many other wild animals, the elephant, species of monkeys, black, grey, and brown, are found in Bornou. The elephant is so numerous near the Tchad that herds of from fifty to two hundred are sometimes seen; they are hunted for the ivory as well as for their flesh. Other wild animals whose flesh is eaten are the buffalo, the crocodile, and the hippopotamus. The flesh of the crocodile is extremely fine, it has a green firm fat, resembling the turtle, and the calippee has the colour, firmness, and flavour of the finest veal. (Denham.) The giraffe is found in the N.W. of the country; here are also antelopes, gazelles, hares, and an animal of the size of a red deer, with annulated horns, called koorigum.

Partridges are abundant and large, but the grousse are of a small kind. Besides these birds many others abound, as do also different species of reptiles, serpents, scorpions, centipedes, large toads, and serpents of several kinds, are very common. A snake of the congo kind measures sometimes from fourteen to sixteen feet in length, but is said to be harmless.

Iron is found in the Mandara Mountains, and imported in Bornou is now sold for great prices. The best comes from Soudan, mostly worked up into good pots and kettles.

The inhabitants speak ten different languages, or rather dialects of the same language. The Shouas inhabiting the borders of the Tchad are Beduins, and have preserved the Arabic, which they spoke in the time of the Negroes. They are the best troops of Bornou, and it is said that this country can muster 15,000 Shouas. The aborigines of Bornou, who call themselves Kanorry, have large unmeaning faces, with dark eyes, broad faces, and black long hair; they have well rounded teeth and large foreheads. Their dress consists of one, two, or three tobes, according to the means of the bearer. Persons of rank wear a cap of dark-blue, but common people go bare-headed, and take care to keep the head constantly free from swarms of flies. They are Mohammedans, and very particular about the external rites of praying and bathing. They are less tolerant than the Arabs. They tattoo their bodies like the other negro nations of these latitudes.

The principal towns or cities are thirteen, among which
the most important are Kouka, Angornou, the residence of the sheikh, and Birnie, the residence of the sultan.

The government is an absolute monarchy; but the sultan has lost all his authority, having been formerly compelled by the Felahs to abdicate the throne. When these enemies were vanquished by the sheikh, he replaced the antient royal family on the throne, but kept all the power himself. His soldiers are well disciplined and armed, and he can if necessary collect an army of 20,000 men.

The country is divided into three districts—the Moors, the Moors of Northern Africa. The Moors bring different sorts of cotton and silk, a few woollen cloths, and various utensils of metal: they receive in exchange only slaves, though the country could offer cotton skins, elephants' hides, and raw hides.

The text continues with detailed descriptions of the region and its inhabitants, mentioning the trade and commerce of the area.

---

As for Berzelius, 100 parts of sassoline being composed of boracic acid, 56.37; water, 43.63; their specific gravity is 1.48. The lustre is pearly, and the colour is greyish or brownish, which they only owe to the nature of the material.

It loses its water of crystallization and fuses at a very low temperature, forming a glassy globule, which is a non-conductor of electricity, and becomes resinously electric on friction.

It has also been found more recently by Dr. Holms to be a deposit of silver within the crater of Volcano, one of the Lipari Isles, being an exhalation of the fumaroles, around the edges of which it forms thin filaments or cakes on the surface of the sulphur.

Boron, or borate of soda, is principally employed (as stated under Boracic Acid) in the arts as a flux in several metallurgical processes, and is very advantageously used in the process of soldering metals. To the chemist it is an invaluable reagent in experimenting with the blow-pipe.

Boron is soluble in twelve times its weight of cold and twice its weight of boiling water, from which it may be readily obtained in very perfect crystals of the oblique prismatic system. The more usual form of these is represented in the accompanying figure, where the faces r are the vertical prism, the angles of which are, according to the measurements of Phillips, 86° 30' and 13° 30'. The smaller edge of which is truncated by M, the obtuser by T, while P is the inclined terminal plane, and makes with M an angle of 106° 30'; O are the faces of a semi-octahedron.

The following are the measurements given by Phillips.

<table>
<thead>
<tr>
<th>O</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
</tr>
<tr>
<td>M</td>
</tr>
<tr>
<td>r</td>
</tr>
<tr>
<td>n</td>
</tr>
</tbody>
</table>

It is very common to find the edges between O and r truncated. The specific gravity varies from 1.4 to 1.5, the hardness from 2 to 2.5. When coloured it is of a light yellowish-green: the fracture is conchoidal and of a resinosus lustre.

Its chemical composition is expressed by Berzelius by the formula \( N + 10 H \), corresponding to the analysis—
Boracite is in many respects one of the most interesting borates of the igneous kingdom. It was first seen by S. Lassia in 1787 under the name of cubic quartz, and was found in the Gyps rocks near Lüneburg in Brunswick, where it occurs in small crystals, which are perfectly developed on every side and imbedded in the gyps. The crystals usually present a combination of the cube, dodecahedron, and octahedron, in which combination, in some cases, the tetrahedron sometimes one of the other forms predominate. The locality was for some time the only spot where boracite was found, until they were discovered in a gyps rock called Seegol in Holstein, at the Köl in which is situated a small deposit of boracite. The boracite of Holstein possesses the same characters as those of Lüneburg, and add considerable interest to the very peculiar rock in which they are found, which is itself a very remarkable object from its abrupt elevation over the sandy plain of Holstein. It is dug near the sea in the same manner as the gyps, and considered to be of the same formation as the Gyps of the Paris basin.

Boracite has been analysed by Stromeyer, who found it composed of boracic acid 67, magnesia 33.

Berzelius expresses its atomic constitution by the formula

\[ Mg_2(Fl) Bo_3 \]

but this differs from the proportions of the analyses, which it must also be stated vary considerably from each other.

The specific gravity is 2.9; it is transparent, but also frequently opaque; the hardness is 6 to 7; it is brittle and has a conchoidal fracture; its lustre is vitreous, inclining to adamantine.

The colour is usually a yellowish or greenish grey; it fuses easily before the blowpipe, at first with much foam, and then forms a glass globule, which crystallizes on cooling, so that the surface is covered with fine acicular points. When just so much soda is added as will form with it a clear glass, it will then crystallize as perfectly as the phosphate of lead.

The most remarkable properties of boracite are its optical and electrical characters. Though belonging to the regular system of crystals, it behaves in many respects as if it were made of an irregular system. In fact, the experiments of Beverst, refracts lightly double and in a similar manner to crystals of the rhombohedron system, the axis of refraction being coincident with an axis joining the opposite angles of the cube. These four axes were doubtless perceived by early philosophers, yet the remarkable property of becoming electric when the crystal was heated, the vitreous electricity being accumulated on one extremity of each axis and the resinous on the other.

Boron, or boracic acid, is a binary compound of carbonic and water, and is obtained by the solution in water of boric oxide, and the action of strong alkalis upon boracic acid.

Boron, or boracic acid, is a powerful medicine in cases of gout, rheumatism, and arthritis, and is also used in the treatment of ulcers and abscesses. It is also used in the manufacture of glass and porcelain. It is a powerful medicine in cases of gout, rheumatism, and arthritis, and is also used in the treatment of ulcers and abscesses. It is also used in the manufacture of glass and porcelain. It is also used in the manufacture of glass and porcelain.

The density of boron when recently prepared is 1.8 and after it has been exposed to high heat in closed vessels its density is increased to 3.4 and it suffers no other change, being neither fused nor volatilized. It is a non-conductor of electricity; the alkalies and acids produce no effect upon it, except the nitric which it decomposes, and is by acquiring oxygen converted into boracic acid.

Boron combines with various elementary bodies, forming with the metals compounds which are termed borates.

Hydrogen and Boron. It appears that, under peculiar circumstances, hydrogen is capable of dissolving a small portion of boron; but no definite compound to which the term of boruret of hydrogen could be applied is known.

Oxygen and Boron unite, and only in one proportion; the compound is described under Boracic Acid.

Boron and Sulphur form sulphur of boron. [Sulphur.]

Boron and Fluorine combined. [Fluorboracic Acid.]

Boron and metals. [See the various metals.]

BOOROOGH OF ENGLAND AND WALES. The term borough, in familiar language, seems to have been, in the olden times, occasionally used, and was doubtless the object of great interest to the government. The broadening of parliamentary reform, and the absorbing interest of the recent struggle to obtain that great constitutional amelioration, made this term synonymous, in the popular apprehension, with a town sending one or more representatives to parliament. The municipal corporations have turned the public attention to that characteristic of a borough in which its existence originally and essentially resides—its organization for local government forming the natural and necessary basis of its political character and efficiency.

The vital importance to the welfare and security of a civilized society, of the general establishment of a wisely-regulated municipal organization, is becoming daily more and more understood, and the question of primary importance is manifestly that which relates to the local government of considerable towns. To enable the reader distinctly to appreciate the general change now operating in the town-constitutions of England and Wales, we shall, for the sake of brevity and clearness, condense the whole of the inquiry into a series of inquiries, each of which is a problem in itself. The word borough is itself a monument, older than all written records, of the state of society in which, in these islands, the institution originated. The Anglo-Saxon byrig, burg, burh, &c. (for the word is written in a great variety of ways), like the German burg of the present day, was the generic term for any place, large or small, fortified by walls or mounds. The fortifications of the continental Saxons, before their inroads on the Roman empire, it is well known, were mere ramparts; and it is probable that they had neither means nor motive for constructing any others. But their conquest and colonization of the greater part of Roman Britain put them in possession of a more solid and artificial class of fortifications, of which, when the first fury of their devastating violence subsided, the Saxons who had exhausted itself, they must in some degree have appreciated the utility. The new circumstances in which the Saxons found themselves—possessing of regularly-cultivated fields, of towns, of ports—must of necessity have led to a more active and civil life; and though the fact of their constituting the great majority of the population in the districts in which they settled, enabled them to keep inviolate the republican spirit of those institutions embodied in the practice of election. The municipal organization of the Anglo-Saxons was not confined to their towns; it pervaded the whole territory; the modern distinction between personal and political freedom was unknown; the right to a weapon for No. 296. [THE PENNY CYCLOPEDIA.] VOL. V.—2 C.

was the expropriation of the Anglo-Saxon possessors, and the introduction of the foreign military tenants. Independent of the personally despotic character of William's position, as the commander of a conquering army, which he lived to see established and confirmed, of which he had individually planned and determined on, necessarily made him the supreme arbiter in the division of the spoil. Reserving in his own immediate possession 'the lion's share,' that is to say, all the larger cities and boroughs, and the greater part of the manors of the baronial lords, the remainder of the lands and towns among about seven hundred tenants-in-chief, that is, possessors on the feudal condition of military service rendered immediately to himself. In making this distribution, regard was no doubt paid to the fact that the strong and enterprising Norman claimant, as also to his length of possession previously to the digesting of the great register of the conquest; but it was from the individual will of the conqueror, as now recorded, that the claim of each proprietor thenceforward derived its sanction; and from this period must be dated the legal maxim in England, that all landed property is derived originally from royal grant. The greater tenants-in-chief, in like manner, retaining portions for their immediate use, subdivided their domains among the higher grade of the tenants-in-chief, and so on down to the minor claimants; so that the whole territory was parcelled out, on this regular system of military organization, into about sixty thousand knights' fees, as they were called; each knight's fee being a portion estimated sufficient to furnish, when requisite, a man and horse completely armed for war.

But every title to property, by inheritance or otherwise, derived from a date anterior to the Norman invasion, was now declared null and void. Very few Anglo-Saxon names were admitted on the list of William's immediate or secondary feudalatories; and thus the body of Anglo-Saxon freetholders in the country and in the towns, the doom of final expropriation was pronounced. With the loss of all property in the soil, the conquered people, forming the vast majority of William's subjects in England, fell into civil and political destitution in which they were left. The very guildhalls of their municipal towns were given away, like everything else, in the division of the spoil. The highest condition of the English in the rural districts was now that of the humble farmer and the rustic artisan, whom their Norman masters called villeins; and in the municipal towns, the townsmen, or resident householders,—according to the Normans, the burgess,—no longer a freeholder, was placed on precisely the same social level as the villein—that of men not indeed personally enslaved, like the serfs, but like the other lower classes, without rights, and therefore subject, according to the feudal maxims of the Normans, besides the rent of their individual holdings, and besides the rigorous payment of the rents and services due by the old English custom, in the nature of compulsory taxation, and by the arbitrary taxation by the crown, in the shape of occasional levies, called by the Normans tailleages or tallages.

Under the Anglo-Saxon government, the revenue of the king, or rather of the state, had been collected in each shire by the shire-reve, and in each municipal town by the borough-reve or port-reve. But in the one case, as in the other, this officer was the elective head of the municipality; for the shire itself was no other than a certain extent of territory municipally organized. But now, instead of the elected officer, placed on the throne by a popular vote, the Norman viscount, and over each municipal town a bailiff, both appointed by the Norman king. How intolerable such a yoke as this must have been to the members of each once free community it is easy to conceive; when, in lieu of a local executive and magisterial officer of their own choice not only their countryman, but their fellow-townsmen, they were placed under a petty agent of foreign extortion, alien to them in race, in language, and in feeling, regardless of their interests, and insolent by virtue of his immediate authority from the potentate above their own, not even their lord's private agent, but the king himself. When, also, we take into account the practice constantly resorted to by the first Norman kings, of farming these bailiwicks to the highest bidder, we may well cease to be amazed at the sickening pictures exhibited to us by the contemporary chroniclers of cruel and reckless extortion perpetrated upon the unfortunate townsmen of England in these reigns. The vitality of commercial indus-

* These two distinctions, among the municipal towns generally, of cities and boroughs, implying actual peculiarity of privileges, were introduced by the Normans.
After long the first signing of the great charter, however, the levying of tallage upon the burgesses, as upon all, was an intolerable grievance; the right of the king's dukedom of Normandy, and of the crown, was of itself an abundant source of vexatious oppression. To show the galling nature of this extortion, we may instance the levy made by Henry II., on pretext of a crusade, in 1187, one of the last years of his reign. As, indeed, a tax upon the freeholding citizens and burgesses of all the municipal towns, and had them individually summoned to appear before him at an appointed time and place. The honour of being admitted into the presence of the Conqueror's great grandson was in this manner granted to ten hundred men, each of whom was rated to be the value of one London burgess and to a proportionate number in the other cities and boroughs. The letters of convocation admitted, neither of excuse nor of delay. The burgesses thus summoned were received a certain number at a time, at several different days, and the king was in the habit of sending agents to each session. When it was notified to them, from the Norman sovereign, through an interpreter, what sum he required from them. And thus," a contemporary historian (Roger de Hoveden, Annales), did the king take from them a tenth of their properties, according to the estimate of good men and true, that knew what income they had, as likewise what goods and chattels. Such as he found refractory he sent forthwith to prison, and kept them there until they had paid the uttermost farthing. In like manner did he to the Jews write and bring till the third year of the reign. This assimilation of the great mass of Anglo-Saxon bur- gesses to the Jews gives us the exact measure of their political condition at the commencement of the second century of the regime of the conquest.

The reign of Henry the Second, the great earl or rather count of Leicester, who led the national resistance to the tyranny of the weak and treacherous Henry III., the first general summoning of representative citizens and burgesses to parliament seems to be attributable, for it was in the year 1163 when Henry was at the height of his power, after the battle of Lewes, that, in calling a parliament, he issued the earliest writ requiring each sheriff of a county to return, together with two knights for the shire under his jurisdiction, two citizens for each city and two burgesses for each town within the limits of the same. The destruction of De Montfort, shortly after, by the exactions of Prince Edward, appears to have prevented this plan of representation of the commons from taking immediate effect, yet it was permanently adopted by Edward himself, at least from the twenty-third year of his reign, as an amelioration which, under the existing internal circumstances of the country, sound policy dictated.

It is plain, however, that in this little was immediately con- templated by Edward beyond the facilitating of the extraordinary payments of taxes, and the preservation of those schemes of national grandeur which so actively and steadily occupied his vigorous reign. The barbarous contempt with which a military aristocracy, so recently sprung from a desolate and expropriating conquest, regarded the great agents of civilization, commerce, though its harshness was abating in proportion as the broad distinction between Norman and Saxon was disappearing in the fusion of blood and language which produced the Anglo-Norman stage of society in England, still subsisted in all these corporations and professions. A curtailment appears in a statute of the middle of the preceding reign, which enacted that feudal lords, who marry those they have in ward to villains or others, as burgesses, whereby they are dispersed, shall lose warship, and the profit shall be converted to the use of the heir for the shire. Done to them. The advantage immediately derived to the burgess population from the substitution for the arbitrary and vexatious mode already described of summoning their deputies to the king's court for the purposes of taxation, of the uniform procedure provided in the great charter, together at the same times and places at which the established estates of the Anglo-Norman parliament were convened, was, not so much the lightening of their pecuniary burdens on the whole, as the effecting and maintaining a more equal and regular distribution of taxation. Nevertheless, the king, in his charter, with the consent of his council, into which, among the laity, none but his immediate feudal tenants and a few summoned by his personal letters were yet admitted, still claimed and exercised the power of taxing the burgesses almost at discretion. Although the knights of the shire, at that period, that is, the representa-
oppose or evade this legislative assent of the Commons; but under his misguided grandson and successor, Richard II., the principle of treating the government of a nation as a private patriarchy was revived. The contest between the court of Richard and the great body of the nation formed a memorable. and interesting part of English parliamentary history. In this place it is only important to exhibit a clear outline of it, as forcibly marking the complete attainment by the representative citizens and burgesses of that legislative character to which they had been accustomed since Edward I., and the acquisition of which revived in the municipal bodies, by and from which they were elected, that political life which, under the regime of the Conquest, had so long been extinguished.

In the seventh year of Richard's reign the commons in parliament made complaints of the government of the realm, and of the abuses which existed in every department of the state, especially in those of law. The king consented that certain prelates and lords should be appointed to examine into these abuses. The commons, recounting their grievances, demanded redress; this he refused until they should have granted him a further supply; to which they would not accede. In the tenth of his reign, the commons sent him the following message: — "We have it solemnly protested against; the government of the kingdom is maintained on an unstable and approved custom, which may one day cause that the king ought to assemble his nobles and commons of the kingdom once a year unto his parliament, as the highest court of the realm, in which all equity ought to shine bright, which is as far as the sun, and wherein poesy, as well as rich may find a lasting and satisfying provision for their refreshment, by restoring tranquillity and peace, and remoring all kinds of injuries; where all public grievances or errors are to be redressed; and wherein, with the most prudent counsel, and uncontroverted good government of the kingdom is to be treated of; and considering that the king and nation's foes at home, and their enemies abroad, may be discovered and repulsed by such means as most conveniently and honourably may be done; and also with wholesome delibe ration to foresee and order how the necessary burthens of the king are the most equitable (the public wants considered), be supplied; they conceive also, that since they are to support all public charges incumbent, they should have the supervisal how and by whom their goods and fortunes are to be expended: they say, moreover, that this is their privilege by ancient constitution; that if the king wilfully estrange himself from his parliament (no infirmity or necessary cause disabling him), but obstinately, by his ungovernable will, shall withdraw himself, and be absent from them for the space of forty days, no consultation of the law and equity, nor the grievous expenses; that then, from that time, it shall be lawful for all and every of them, without any damage from the king, to go home, and return into their own countries; and by you, for a longer time, have absent yourselves; and, for the most part, to be among them." The king, in his answer, declared his intention of calling in the French to assist him in the attack which he meditated on the national liberties. The barons replied, that such a step would lead to his destruction; that all his misfortunes were owing to the power, as guardians of the public purse, by calling Sir Simon Burley to account for a large sum of the public money he had wrongfully expended; and not giving a satisfactory answer, he was committed to the Tower. Another striking illustration of the power they had, is afforded at this time, in their first conspicuous exercise of the right of impeachment, against Richard's chancellor and prime minister, De la Pole. But eleven years afterwards, in 1398, this king, to procure a house of commons more suited to his own purposes, resorted to a pernicious expedient. He summoned the several sheriffs, and charged them to suffer none to be elected and returned members to this parliament who would not promise to agree to the king's measures; at the same time declaring he would raise an army to punish such of his subjects as should offer to oppose his intentions, and asking them what force each county could contribute towards the establishment of his authority, and never bear being deprived of the freedom of elections; and that, as for raising an army, they never take up arms to oppose those barons who had gained the affections of the people by defending their rights and privileges. In March following, he met the commons in the house of commons, retaining his packed house of commons, which by ministering servitiously to his tyrannical will hastened his overthrow. The very next year, the national indignation and resistance, coinciding with the personal views of the exiled Henry of Burgundy, under the influence of which the king was reduced to the condition of a supplicant captive, and compelled him to call 'a free parliament,' the first act of which was his own solemn impeachement, condemnation, and deposition.

The greater regularity of proceeding in this revolution than in that which had set aside Edward II. marks the rapid growth of political intelligence among the body of the people, and more particularly of that town population which furnished so preponderating a numerical proportion of the members of parliament. On the introduction of the new rolls of parliament, the new king and the lords made a full and explicit acknowledgment of the equal rights which the commons possessed with the latter in matters of legislation, of taxation, and of counsel to the crown.

Under the Great Charter the former inhabitants of the towns and the tenants for the recovery of their ancient municipal and political freedom were embodied in prayers for the restoration of the laws of Edward the Confessor. When, in the progress of Anglo-Norman society, the municipal rights of towns and boroughs were included with the civil and political rights of the barons, knights, and freeholders, in the Great Charter, the latter solemn instrument became the watchword of the burgess population. But from the historical period at which we have now arrived, when to the restoration of the municipal independence and recognition of their political existence, a free parliament became the constant cry of the citizens and burgesses in common with the great mass of the nation, when the common liberties were conceived to be in danger.

The support of a house of commons possessing the popular confidence was henceforth necessary to the security of any government in England. The rash and blind attempt to govern without a house of commons at all was never again made until a Stuart reigned; and the scarcely less rash attempt to govern by a house packed in defiance of the wishes of the people, after intermittent elections, was the true cause of the fall of the house of Lancaster in the reign of Henry VI.; as the sanction of a real popular representation formed the basis of its permanent restoration in that of Henry VII. Until the accession of the Stuarts the great mass of the people were most arbitrarily inclined, was persuaded that management, not coercion, was the only safe course to be pursued by the crown towards that assembly. There were two modes of exercising this management; first, by influencing the returns of members; secondly, by tasting with individual members when returned. The latter expedient could be little resorted to until later periods, and belongs indeed rather to the history of the Commons' House in general; but the practice of the former demands a brief notice, in as far as relates to the subjects of this work. The return of members for boroughs having then patrimates of their own, and Monmouthshire being part of Wales, which was not yet legislatively incorporated with England, nor even effectively subjected to the English crown. It was as the king's subjects, that is, as local superintendents of the crown revenues, that the precepts for election of knights, citizens, and burgesses, were addressed to this officer; he was to make returns for every city and borough in his bailiwick,—another mark of the original power of the popular representatives was conveyed, that of taxation only.

So long as this continued to be the sole object of their cou-
vocation, and so long as the delegated burgesses themselves had little voice in fixing the rate of impost to be levied on th\textemdash recharge.\textemdash when the burgesses, or men of substance in the cities and boroughs in particular, should often have petitioned to be excused from the sending of delegates on these occasions, which added to their share of the public burthen, the expense, to them considerable, of the wages which by royal writ they were to have allowed from those persons who were to act in the parliamentary service, and which were fixed at two shillings each per day, being one half the amount appointed to be paid by the county freeholders on the like occasion to a knight of the shire. As the king's writ addressed to the sheriff specified no particular city or borough, but required him to send a number of burgesses as the number of freeholders entitled to a member in parliament allowed, the officers concluding sometimes with the words 'there are no more cities or boroughs in my bailiwick,' though there were in fact more boroughs; and sometimes ending with 'there are not any other cities or boroughs within the county from which any citizens or burgesses can or are accustomed to be sent to the said parliament, by reason of their decay or poverty.' Inasmuch as this circumstance in the original framing of the parliamentary writs might appear at the time, its results have been momentous. It must have been at least as momentous as the commission of Simon de Montfort and of Edward I., that in convoking so large a number of delegates from towns, in order to tax them with greater facility and uniformity, they were laying the foundation of a separate house of legislature, wherein the representatives of that part of the population most alien to the feudal domination should be found. This practice, of course, is exemplified by a number of instances. The fact is, that the boroughs required no small stretch of temerity, in an age when the people were peculiarly jealous of the freedom of parliamentary election, to venture, in spite of the plainest common sense and of the notoriously prescriptive usage, to assert their liberties. Thus, in the preamble of the writ was that, the citizens and burgesses, as well as the knights, should be elected, under the sheriff's superintendence, in the county court. The government of the day however had more powerful means of emboldening the petitioners against the political liberty of the municipal towns by the success of their first steps against the freedom of parliamentary election in the enactment and operation of the disfranchising statutes of the 6th and 10th of this reign, which limited the county of each borough to a number of free holders of property required to be paid in money; and so amount in that day considerable. But their practices against the representative freedom of the cities and boroughs produced the following enactment, in pursuance of the preamble given above:--'That every sheriff, after the delivery of any such writ to him made, shall make and deliver, without fraud, a sufficient precept under his seal to every mayor and bailiff, or to bailiffs or bailiffs where no mayor is, of the cities and boroughs within his county, reciting the said writ, commanding them by the said precept, forthwith or within such time as by the said writ shall be directed, to cause such writ to be served on the mayor and aldermen, citizens and burgesses of the same town, and on the sheriffs, to be served on the mayor and aldermen, citizens and burgesses of the same town, and on the sheriffs, to the grievous complaints of the commons against undue elections for shires from the partiality of sheriffs,' and enforced by another of the eleventh of the same reign, enacting heavy penalties upon sheriffs who proceeded irregularly in electing members from the boroughs. Hence, as on the 21st of the first year of Henry V., which, amongst other provisions for the due conduct of elections, enacts that the citizens and burgesses should be chosen out of those who were free of and dwelling in the respective cities and boroughs. The preamble of a statute of the 33rd of Henry VI., confirming former acts relative to elections, is more explicit on this head. It declares that every sheriff and alien body of freeholders or burgesses in the cities and boroughs coming to the parliament should be chosen men, citizens, and burgesses, resident, abiding, and free, in the same cities and boroughs, and none other; which citizens and burgesses have always in cities and boroughs, for the time being, to be chosen by citizens and burgesses, and no other, and to the sheriffs of the counties returned, &c., until now of late that divers sheriffs of the counties of the realm of England, for their singular avail and lube, have not made due election of the knights, nor in convenient time, for good men and true representatives, and sometimes no return of the knights, citizens, and burgesses lawfully chosen to come to the parliament, but such knights, citizens, or burgesses have been returned which were never duly chosen, and other citizens and burgesses than those which by the mayor and aldermen the said citizens and burgesses returned, and sometimes the sheriffs have not returned the writs which they had to make election of knights to come to the parliament, but the said writs have impleaded, and moreover made no precept to the mayor or bailiff, or to the bailiffs or bailiffs where no mayor is, of cities and boroughs, for the election of citizens and burgesses to come to parliament, by colour of these words contained in the said writs, 'Quod in pleno comitatu tuo eligi facias pro comitatu tuo duos milites, et pro quilibet civitate in comitatu tuo duos eves, et quosquid aliud fuerit praebendum in favorem tuum.'

Herein we find a remarkable illustration of the daring attempts which the shortsighted advisers of the imbecile king Henry VI. were making to vitiate the constitution of the commons' house. The interpretation which the sheriffs were instructed to put upon the somewhat ambiguous terms of the established formulas of the writs was, without exception, the strictest and most literalistic of their line of policy in this matter. The Latin text given above, literally rendered, would run thus:--'That in full county court you cause to be elected for your county two knights, and for each city in your county two citizens, and for each borough one citizen, at the time of the meeting, and requiring no small stretch of temerity, in an age when the people were peculiarly jealous of the freedom of parliamentary election, to venture, in spite of the plainest commonsense and of the notoriously prescriptive usage, to assert their liberties. Thus, in the preamble of the writ was that, the citizens and burgesses, as well as the knights, should be elected, under the sheriff's superintendence, in the county court. The government of the day however had more powerful means of emboldening the petitioners against the political liberty of the municipal towns by the success of their first steps against the freedom of parliamentary election in the enactment and operation of the disfranchising statutes of the 6th and 10th of this reign, which limited the county of each borough to a number of freeholders of property required to be paid in money; and so amount in that day considerable. But their practices against the representative freedom of the cities and boroughs produced the following enactment, in pursuance of the preamble given above:--'That every sheriff, after the delivery of any such writ to him made, shall make and deliver, without fraud, a sufficient precept under his seal to every mayor and bailiff, or to bailiffs or bailiffs where no mayor is, of the cities and boroughs within his county, reciting the said writ, commanding them by the said precept, forthwith or within such time as by the said writ shall be directed, to cause such writ to be served on the mayor and aldermen, citizens and burgesses of the same town, and on the sheriffs, to be served on the mayor and aldermen, citizens and burgesses of the same town, and on the sheriffs, to the grievous complaints of the commons against undue elections for shires from the partiality of sheriffs,' and enforced by another of the eleventh of the same reign, enacting heavy penalties upon sheriffs who proceeded irregularly in electing members from the boroughs. Hence, as on the 21st of the first year of Henry V., which, amongst other provisions for the due conduct of elections, enacts that the citizens and burgesses should be chosen out of those who were free of and dwelling in the respective cities and boroughs.
Welsh territory, and of the palatine county of Chester, one of the most beneficial operations of the reign of Henry VIII., next demands our notice, as bringing a permanent accession of thirty-one members to the English House of Commons. Over such a mass of acquisition there was no representative in the boroughs. In this legislative incorporation of Wales and Cheshire a new principle was introduced, that of determining by parliamentary enactment what towns within a particular territory should elect members, and what number they should elect. This indefinite extinction of the municipal franchises, the absolute severance of the territorial representation having ever been agitated since the time when the House of Commons was in embryo in the earliest royal convocations of knights, citizens, and burgesses for the assessment of the taxes exacted to support the royal arm in the state of conquest since their final subjugation by Edward I.; their continued exclusion from the English legislature must have mainly contributed to stimulate their vigorous and persevering resistance under Glanower in the reigns of Henry IV. and V.; and their admission into it was become a measure most desirable for the national peace and security.

But the free concurrence of the House of Commons itself was now indispensable. The nature and uses of popular representation too, and the importance of having some regard to the proportion between the number of a constituency and the magnitude of the business to which it was permitted to elect, were both better understood. Accordingly the act for Wales, passed in the 27th of Henry VIII., though it excluded none of the boroughs from a share in the representation, yet, having regard to the inconsiderable size of most of them, while Haverfordwest should send one member for itself alone, the boroughs of each of the other thirteen shires now created (including Monmouthshire, now first detached from Wales) should send one member collectively, excepting only Meigneuxshire, which contained their borough of Borrowary. This perfect union with Wales rendering the palatine government of Cheshire, originally established as a bulwark against the Welsh inroads, no longer necessary, another act, of the 34th of this reign, incorporated it in like manner with the counties of Chester and Flint, expressly limiting the town representation to the city of Chester.

Here we must pause in our sketch of the political relations of the English boroughs, to trace the progress of their internal organization from the state of simplicity in which it revived on the first relaxation of the yoke of the Conquest. It is only necessary to recollect the nature of the relation subsisting between the English boroughs and the Norman kings in the period during which they successively purchased their civil redemption, in order to be convinced that the local comfort and welfare of the burgesses were objects among the first in the mind of the sovereign. Their primary aim was the securing of the regular, punctual, and willing payment of the stipulated rent, and the ensuring in each locality of so much internal peace and order at least as to them might seem requisite for enabling the community to perform this stipulation with exactness. Further than this they concerned themselves not at all about the internal regulations of the municipality. Its whole community, now rising again from one and the same level of civic nullity, were at liberty to adopt either the ancient customs and usages of the place as existing before the Conquest, or such others as they might think proper to establish in accordance with the common law of the land. The charters were constantly addressed to 'the citizens,' 'the burgesses,' or 'the men' of such a city or borough; and the sum of the desiderata by the sovereign was the protection of the community of the borough, as Madoc in his Firma Burgi ob, serves, was this:—They were deemed townsfolk who had a settled dwelling in the town, who merchandized there, who were of the hans or guild, who were in lot and sort with the citizens, and free customs of the town.' The municipal body, in short, consisted of the resident and trading inhabitants, sharing in the payment of the local taxes and the performance of the local duties. This formed substantially a household franchise. Strangers residing temporarily in the place were not eligible to either of the marks of citizens of the borough nor any liability to its burdens, which, at common law, could not be imposed upon them without admission to the local franchise. The titles to borough freedom by birth, apprenticeship, and marriage, all known to be of very remote antiquity, seem to have been only so many modes of ascertaining the general condition of established residence. The title by purchase was a necessary condition for the admission of an individual previously unconnected with that particular community, in those days when the only commerce of the country was carried on by barter and currency, and the right of trading; and the right of bestowing the freedom on any individual by free gift, for any reason to them sufficient, was one necessarily inherent in the community, for the exercise of which they were not responsible to any authority whatever. Moreover, the power itself was one that had some ground of justice when they who enjoyed it exclusively supported the local burdens. Edward III.'s laws of the staple authorized the residence of non-freemen in the staple towns, but at the same time empowered the common council of the town to exclude them from the exercise of their public burdons; and under these regulations it is that the residence of non-freemen appears first to have become frequent.

The progress of wealth, population, and the useful arts, produced, in many of the greater towns, the subdivision of the general community into guilds of particular trades, called, in many instances since the Norman war, companies, which thus became avenues for admission to the general franchise of the municipality. In their greatest prosperity these fraternities, more especially in the metropolis, became corporate bodies separate and distinct from the towns, though the officers of their general council, namely, the barons of the exchequer, the king's attorney, or his other clerks and officers, charged, impleaded, and sued the townsfolk collectively, by any name by which they could be accurately designated, and they answered by one or more of their number, deputed for that purpose by the rest. There was also a method of summoning a community to appear in the king's courts of law, by six or some other number of the better and more discreet inhabitants, to be nominated by the rest. The duties of the boroughs to the king were rendered entirely by the Garrisons of officers, elected yearly by the whole community. Generally it was granted to them to elect a single chief magistrate, bearing, as already observed, the Norman title of mayor, who became answerable to the crown for all things in which the bailiff or bailiffs were previously responsible, and the officers were under the custody of the mayor and the city. But there was an executive officer, thus elected, it was always necessary to present to the king, or some one appointed by him, to be accepted and sworn faithfully to discharge his duties both to the crown and to the community; and to receive these presentations, accept the officer elected, and take his oath that they would become a part of the duties of the treasurer and barons of the exchequer. To these, when the citizens or burgesses had made their election, it was notified by letters under their common seal, and the mayor elect was presented to them at the exchequer by two of his fellow-burgesses. The same proceeding was observed with regard to sheriffs, which some of the larger cities and towns acquired power to elect as counties of themselves; and for the like reason, because of the duties they had to render to the king. In course of time many of the smaller towns by charter or otherwise obtained the right to preside over the oaths of their own officers, or they might be tendered to the constable of the nearest royal castle. If such officer performed any official duty without being duly sworn, it was deemed a contempt, and the liberties were liable to be taken away or strangled into the king's hands, unless redeemed by fine or a valid excuse.

But the sole legislative assembly in every municipal town or borough was originally the Saxon folk-mote, or meeting of the whole community, called in many places the hundred, and whenever held within the doors, the hus-ting or the town hall. This meeting was open at all times and under all general determination on the affairs of the community, whether in the enacting of local regulations, called burgh-laws (by contraction by-laws, since often corrupted into bye-laws), the levying of local taxes, the selling or leasing of public property, the administration of justice, the ap-
pointment of municipal officers, or any other matter affecting the general interests. In this assembly, held commonly once a week, appeared the body of burgesses in person, to whom, together with their officers, whom they elected annually, each privileged county by the royal counters was granted; and however vested in later times, every power exercised in the antient boroughs has derived its origin from the acts of this assembly. How the increase of population and extension of trade in the larger towns led to new regulations, the introduction of clerks in local legislation, &c., and the natural tendency of its operation towards the production of an aristocratic organization, will be best illustrated in a succinct view of the history of the metropolitan municipality itself, the magnitude of which, the extent of which, the holiest scope for the distinct development of these tendencies.

Although William of Normandy, in consolidating his conquest, had trampled out even those scattered sparks of political vitality which in the course of his invading career he had spared in order to deaden or smother local resistance, yet his successors soon found it to their purpose, though still retaining the arbitrary grasp of the Norman crown upon the municipal liberties and properties of the Anglo-Saxon towns, to exercise that power in the case of the municipally-endowed ports more generously than William had done. Thus it was that London, in particular, and the sea-ports on the south-eastern coast, then of primary importance to the Norman crown for maintaining a free communication with its continental dominions, as well as for supplying its own naval forces, of which the early observer of royal favour—for the time indeed capriciously extended and withdrawn, but settling into permanence with the growth of Anglo-Norman society. Another circumstance contributed to give to these towns the lead in the general progress of the Norman conquest; the recovery of their civil and political freedom. Though the great majority of the burgesses, even in those favoured towns, were necessarily of Anglo-Saxon blood, yet there were soon found among them a certain number of foreign descent, Norman, Angevin, or French, whose ancestors, having settled in the towns as large factors of trade or as landed proprietors, had made the various branches of trade. To these individuals, on account of the identity of race and language, the favour of the Norman government was least reluctantly extended; they became, too, the natural interpreters and mediators between the government and the great body of their fellow-townsmen; and the necessary tendency of these two circumstances combined, was to establish in the great metropolitan municipality a Norman party, vastly inferior to the English one in numbers, but dominant in position. This is by no means a matter of mere speculation, but is marked in the various symptoms of internal city life. The operation of these circumstances is very clearly and strikingly exhibited in the civic commotion in the time of Richard I., in which the main scene was on the rival claims of Saxon descent, to whom, from his adherence to the customs of his forefathers in wearing his beard long, the Normans gave the cognomen à la barbe, and whom our modern historians call William Long-Beard. We find this transaction very particularly detailed in the Latin historians of the time, both on the popular and on the Norman side—Roger de Hoveden, Math. Paris, Math. of Westminster, Ger- vase of Canterbury &c. The facts collected from their joint testimony, as far as they relate to our present inquiry, are as follows.

Among the vexations which the poorer and more numerous class of the citizens had to endure from the more opulent, one of the most frequent was the unfair apportioning of the payment of the taille or tallage, the nature of which arbitrary exactions we have already described; for sometimes the mayor and aldermen, to whom the royal demand of a fixed sum was addressed, would exempt those who were most able to pay from contributing at all; sometimes they ordained that each citizen should contribute the same sum, without regard to the respective amount of property; so that the heaviest burden constantly fell on those who were the least able to bear it. In the year 1196, when Richard I. was engaged abroad in making war upon the King of France, and his officers in England were raising money for the expenses of his campaigns, and for paying the remainder of his ransom due to the Duke of Austria, the city of London was summoned to pay a tallage extraordinary. The mayor and his councillors accordingly convoked a hustings, or common-hall, to deliberate as to the proportions in which the gross sum required should be individually imposed. The Christians among the burgesses, by the royal council, were so made as that the lightest portion of it would fall upon themselves. But the Man of the Long Beard stood forward to oppose their intention. He had often before pleaded the cause of his poor English fellow-citizens with more arbour than address; and now, by the artful representation he gave of his eloquence was vigorous and popular, no Norman clerk excelled him in the art of pleading in French, the only language then admitted in the tribunals. While the use to which he devoted these talents made him dear to the citizens of the middling and lower rate of fortune the Norman party charged him with misleading the multitude, by filling them with 'an inordinate desire of liberty and happiness.' On the occasion in question, they loaded him with reproaches, and accused him of rebellion and treason. Ten years ago he had been fetched by the Holbein monster of Anglo English eloquence was vigorous and popular, no Norman clerk excelled him in the art of pleading in French, the only language then admitted in the tribunals. While the use to which he devoted these talents made him dear to the citizens of the middling and lower rate of fortune the Norman party charged him with misleading the multitude, by filling them with 'an inordinate desire of liberty and happiness.' On the occasion in question, they loaded him with reproaches, and accused him of rebellion and treason. Ten years ago he had been fetched by the Holbein monster of Anglo
tion to resist this demand; and the cause of arbitrary power
was gained as soon as the hostages were led away from
London to confinement in different fortresses. The particu-
lars of the subsequent seizure, summary condemnation, and
disproportionate vengeance, with which the interest of martyrdom bestowed upon him by the popular affection,
are immaterial to our present purpose. This historical
anecdote is introduced merely to exhibit distinctly the
source and operation of the first aristocratic distinction
that ever arose in this country.
But as the distinction of race became lost in the fusion
of blood and the rise of the modern English tongue, other
circumstances sprang up, tending to create and perpetuate
a distinction of civic classes. The progress of individual
wealth, the increase of taxation by arbitrary power, and the commercial resources of the country became developed, was among the most powerful of these causes. The necessity, too, for the con-
venient transposition of the affairs of a multitudinous body,
of establishing a representative council for the management
of all ordinary business, was another cause operating in the
same direction. In London, as early as the close of Henry
III.'s reign, the aldermen, and those calling themselves
the more discreet of the city, made an attempt to elect a
representative assembly, voting for their own aldermen;
and ended in the triumph of the latter, in a general folk-mote
held at St. Paul's Cross. In the reigns of the first three
Edwards, it appears that the same election was made by
the mayor, aldermen, and a varying number of freemen of
the city; but the usurpation of power by the house of
aldermen, being the only council to the mayor in the ad-
ministration of justice and in his other duties, elected
annually by the freemen of the several wards; and from
them the mayor might resort for advice to the commonalty in
matters of affability, and to a great number of the citizens, and the variety of business
to be transacted, made it necessary for them to have a sort
of standing committee of their body, to be consulted by the
mayor and aldermen, and to exercise the power belonging
'to the council of the city.' The mayors, therefore, had
the general administration of the affairs of the community.
The whole of this legislative and administrative body, being
chosen yearly by and from the commonalty at large, acted
under the most direct responsibility to their constituents.
Such a council appears, from the city records, to have existed as early as the year 1294: but though it is now
deemed in law to be a prescriptive body, this is attributable
rather to its not deriving its existence from royal charter,
than to any certainty of its existence before the time of
legislation, because the power and constitution were often
changed. Nearly thirty years after the William of
Lyon was, by charter, of the 15th of Edward III., of the power
in the citizens to make bye-laws, it was, by consent of all the common-
s of the city ordained that each of the mysteries (mas-
teries or crafts), that is, each of the trading companies, should
choose one of their aldermen as the clerk of their company,
and elect a mayoral and aldermen, whatever they should deem advisable;
to elect the mayor and sheriffs; and to give counsel in all
cases where it was formerly sought of the commons. This
was in the 43rd or 44th of Edward III., and was confirmed
in the 7th of the same reign; but the common-hall or
court of hustings of the whole community still retained the
right of rich re-modelling the municipal legislature; and in the
7th of Richard II., the common-council was placed on its
present footing by an act of common-hall, passed in the
presence of the mayor, aldermen, and commons. As in such large assemblies things had been done more
by clamber than by reason, the aldermen, when, on St.
Gregory's day in each year, they were appointed for the
year ensuing, should be firmly charged, fifteen days after
the said day, to assemble their respective wards, and, by
good deliberation, charge them to choose four of the most
sufficient persons in their ward, to be of the common-council for the
year ensuing, &c., provided that of the whole num-
ber no more than eight should be of one mystery.
Except as to the wards of the citizens, which were
heretofore to this act of common-hall took full effect; the
whole administrative powers of the community were
transferred to the legislative body, composed of mayor, aldermen,
and common-councillors, all subject to annual election;
and the ancient hustings-court fell into comparative de-
suetude; although, on one subsequent occasion, in the 23rd
of Henry VII., we find the mayor, aldermen, common-
council, and commons, acting together as one great common-
hall, in accordance with the original constitution.
Such was the natural origin of the courts of aldermen and
common-council in the city of London; and how closely
they are associated with other communities, is abundantly
tested by existing documents.
In those instances where the whole of the citizens or
burgesses were numbered in the several trading companies,
these, for convenience' sake, sometimes formed the basis of
the internal government of the community. In many
borough officers and members of the common council be-
came vested in them. London itself presents at this day a
remarkable instance of incomplete progression from the
household franchise to the adoption of that of the guilds:
the inhabitants of the aldermen and common-
councillors; while the livewermen, or members of the several
companies (so denominated from the distinguishing pecu-
liarities of costume adopted by each fraternity), resident or
non-resident, elect the mayor, sheriffs, chamberlain, and
other officers. But, in many boroughs, this basis of the
guilds wholly superseded the original scot-and-lot franchise;
and in the changes of society which have gradually reduced
the guilds from their original position, that thorough sub-
stitution has been one constantly growing cause of unfair
and undemocratic practices. Thus, a new body of
officers, too, being generally chosen by the inhabitants at large to the highest places in the municipal councils, were often tempted
to seek the perpetuation of their authority without the
necessity of frequent appeals to the popular voice, and even
when they had not. Such usurpations however were often vigorously resisted by the community at large; and the contests were sometimes so
violent and obstinate as to lead to bloodshed. But in course of
time, the Crown itself, so long indifferent to the details
of municipal politics, found itself, on the one hand,
encouraging these endeavours of internal parties to form
close ruling bodies, irresponsible to the general community.
In order to trace the development of this policy, we must
resume the thread of the political history of the municip-
alisms of England.
We find faint indications of it in several of Henry VII.'s
charters; as in one to Bristol in 1499, establishing a self-
elective council of aldermen; who yet, though justices, had
no exclusive power of municipal government. But the fierce-
ness of religious dissension, which divided the whole nation
at the close of the following reign, made the management
of the House of Commons an object of primary importance to
either Catholic or Protestant successor to the crown. This
therefore was the era of the most active exercise of the pre-
cedent powers of the towns, with some of the smaller
within their several bailiwicks, in issuing their precepts for
a general election, which of the municipal towns should,
and which should not, be held to be parliamentary boroughs.
To arbitrarily omit any of the larger towns, or even of the smaller ones, by which legislation had had a prescriptive
right to be so held, was too open an admission of the su-
premacy of the crown to be now ventured upon. The calling
of this right into action in boroughs wherein it had lain dormant from the beginning, or, though once exercised, had fallen
into disuse from alleged poverty, decay, or other causes, was
a more plausible course of proceeding; and notwithstanding
the evident partiality with which it was conducted, was per-
mitted to pass without legislative interference.
Accordingly we find in the reigns of Edward VI.,
Mary, and Elizabeth, besides seventeen boroughs re-
quired to pass through the ordeal of the test vote, more
than two hundred others being requested to send members, making altogether an addition to the
former representation (as no places were now omitted) of
sixty-three places, returning 123 members. But the most
important feature in this policy of the crown at this period—
that which mainly contributed to attain the object of that
policy—was its novel assumption of the right of remoulding,
by governing charters, the municipal constitution of these
new or revived parliamentary boroughs. Most of these
charters expressly vested the local government, and some-
what more or less, the independence of the several
representatives, in small councils, originally nominated by the
crown, to be ever after self-elected.
This was the first great step on the part of the crown in
undermining the political independence of the English mu-
picilalities. The successful working of the application of
the novel principle to the new or restored parliamentary boroughs,
couraged the Stuarts not only to continue this system of
creating close boroughs, but to make a second and a bolder advance in the same direction, by attacking the constitutions of the prescriptive parliamentary municipalities themselves. Already, in Michaelmas term, 40th and 41st of Elizabeth, the judges had given a remarkable decision, extremely favourable to the prosecution of this object. Attempts appear to have been making in several of the boroughs to have popular elections of the principal officers, in opposition to a custom which had grown up of leaving the elections in the hands of the common councils. It was now, therefore, desired to be known whether such elections were legal, in opposition to the words of a charter bestowing the elections indefinitely in the commonalty. It was on application by the Privy Council, that the two chief justices, the chief baron, and the other judges, determined that such custom was good, because the several boroughs had power to make bye-laws, and that no bye-law or regulation was to be found; it might nevertheless be presumed that such bye-law had existed, because such custom must have originated in common consent. And thus it was judicially decided, not only that elections of municipal officers by select common councils were legal, but that where such custom had grown up, the community at large were for ever excluded from such elections.

The inequities involved in this decision, and the disregard of all constitutional principle, are very notable. That the power of the prerogative to impose a prerogative law at its discretion should be excluded, for ages before, all appeal to the inherent right of freemen to a voice in the appointment of those who were to have the direction of their common affairs, is perfectly intelligible. That on the royal charter, and on the common-law principle constantly reiterated throughout the history of these countries, the power of internal organization as they claimed to exercise, is sufficiently manifest. Here the burgesses and the royal judges should seem to have been meeting on common ground. The burgesses simply appealed against a vexation of custom; the growth to a demand and to an assertion of authority of their charter. The judges, instead of vindicating that authority, as it should have been the primary interest of the prerogative to do, asserted—first, that the power of making bye-laws, given by the charter, empowered the charter to make a bye-law among its privileges, an expansion of the same charter; secondly, that there was a particular kind of bye-law, which, though the community had power to enact, they had no power to repeal; and thirdly, that in a certain case, the existence of an express law was to be presumed upon usage commencing within time of memory. This transaction, therefore, presents a most curious example of the compromising, by the crown itself, of the very principles on which the stability of the prerogative most firmly rested, in the eager pursuit of its immediate purpose.

The judicial authority being thus once brought into play to decide, for the crown's own immediate convenience, upon the extent and durability of its powers in the granting of municipal charters, was kept in active operation throughout the Stuart reigns, and the two Stuart judges proceeded so far as to declare that the king could, by his charter, incorporate the people of a town in the form of select classes and commonalty, and vest in the whole corporation the right of sending representatives to parliament, at the same time that select class and select classes; and such was the forward form of all the royal charters which royal charters created or remodelled. After this fashion it was that, under James I. and Charles I., seventeen more parliamentary boroughs were revived; and that James created four, making in all nine, besides the four members, besides the four members for the two English universities, which James first introduced.

That all these acts combined were insufficient to counteract the representative house of the popular spirit, and the spread of political knowledge consequent upon the diffusion of printing, so far as to render that assembly thoroughly subservient to the views of the Court at that period, is a fact too notorious to be here enlarged upon. Charles I. attempted, and succeeded in, the same thing as his predecessor. That fact, we have found it expedient solemnly to forego—the levying of general taxes without consent of the Commons in parliament. This was the true commencement of the struggle. The narrative of the consequent events—of the necessity which drove him once more to have recourse to parliament—the necessity, not less urgent, which drove the Commons to extort from him the act which prevented their being dissolved without their own consent—the distrust which eventually arose between the people and that House of Commons which so long continued in self-constituted permanency—and its final dissolution by force, to make way for the arbitrary modifications introduced by a military dictator—forms rather a conspicuous chapter in the annals of our country, than an incident of that history itself. The endeavours of the Protector to mould a House of Commons which should both second his political views and possess the confidence of the people proved abortive; although, by omitting the more innoxious boroughs, preserving the representation of the others to the population of the several places, and increasing that of the counties, he seems to have made a show at least of seeking to place the general representation on a basis more accordant with the relative numbers and importance of the several places containing such representation.

' A free parliament' was as much the national watchword in 1660 as it had been in 1640; and Charles II.'s hereditary claim would have availed him little without that parliament's declaration of it.

The thirteenth year of this reign is memorable for the enactment of the statute, commonly known as the Corporation Act, which so long operated to the exclusion both of Roman Catholics and of Dissenters from all corporate offices. It provides that 'no person or persons shall be placed, elected, or chosen to be a mayor, or alderman, or borough-monger, or a constable, or a porter, or a reeve, or a night-watchman, or a master baker, or a master brewer, or a reeve, or a master mason, or a master plaster, or a master carpenter, or a master molder, or a master gilder, or a master leather, or a master draper, or a master tailor, recorder, bailiff, town clerk, common-councilman, or other offices of magistracy, or place or trust, or other employment relating to or concerning the government of any city, corporation, borough, county, or any of their divisions, unless an English, a Welsh, or a Scottish subject by birth or adoption.' The Act, which was passed on June 13, 1662, and which, without the first clause, would have nullified the important provision of the Act of Settlement of 1672, that shall not have, one year before such election or choice, taken the Sacrament of the Lord's Supper according to the rites of the Church of England. But this legislative measure, which was dictated by the public opinion of the time, and was a direct blow at the levelling spirit of the Puritans, was but a short and insignificant interlude in the popular career of Charles. Tweed, that shall not have, one year before such election or choice, taken the Sacrament of the Lord's Supper according to the rites of the Church of England. But this legislative measure, which was dictated by the public opinion of the time, and was a direct blow at the levelling spirit of the Puritans, was but a short and insignificant interlude in the popular career of Charles. Tweed, that shall not have, one year before such election or choice, taken the Sacrament of the Lord's Supper according to the rites of the Church of England. But this legislative measure, which was dictated by the public opinion of the time, and was a direct blow at the levelling spirit of the Puritans, was but a short and insignificant interlude in the popular career of Charles. Tweed, that shall not have, one year before such election or choice, taken the Sacrament of the Lord's Supper according to the rites of the Church of England. But this legislative measure, which was dictated by the public opinion of the time, and was a direct blow at the levelling spirit of the Puritans, was but a short and insignificant interlude in the popular career of Charles. Tweed, that shall not have, one year before such election or choice, taken the Sacrament of the Lord's Supper according to the rites of the Church of England. But this legislative measure, which was dictated by the public opinion of the time, and was a direct blow at the levelling spirit of the Puritans, was but a short and insignificant interlude in the popular career of Charles.

As the proceedings now adopted against such of the governing charters of cities and boroughs as still sanctioned a corporate or municipal constitution, was a general filing of what are technically termed informations in the old Latin formula of quo warranto, from the prominence of those words in the old Latin formula of the instrument itself, it is necessary that we should briefly explain the origin and use of that form of information on the part of the legal advisers and officers of the crown.

Although many of the ancient boroughs received their first Anglo-Norman charters of liberty from the successors of those military leaders who had received from the Conqueror charters of eight or ten years' standing, with the general relaxation of the feudal bonds at the same time that the relations of the boroughs with the crown became more determinate and regular, brought nearly all of them, at an early period, into immediate dependence, as the dependence of towns on the crown, in addition from the first, upon the validity of royal charters for the management of their own local privileges. When some degree of regularity arose out of the judicial chaos necessarily introduced by such a conquest, the justices itinerant were empowered by the crown to inquire, in their circuit, by what warrant all these charters were claimed any franchise or privilege, or from which all local liberties were assumed to emanate, maintained their title. In the 18th year of Edward I., who laboured strenuously in various ways to infuse order and permanence into the internal administration of the realm. We find the following statute which had been directed to an object quite contrary to that which in the use of the preceding in question the crown so eagerly pursued at a later period. Concerning the writ that is called quo warranto, our lord the king, at the feast of Pencost, in the eighteenth year of his reign, hath established, that
all those who claim to have quiet possession of any franchise before the time of King Richard, without interruption, and can show the same by a lawful inquest, shall well enjoy their possession; and in case that possession be demanded for cause, the sentence of our lord the king shall confirm it by his writ. And those that have not the said charters adjudged according to the tenor and form of them; and those that have lost their liberties since Easter last past by the aforesaid writ, according to the course of pleading in the same writ heretofore used, shall have restitution of the franchise lost, and from henceforth they shall have according to the nature of this present constitution. The proceeding by quo warranto, however, had long been obsolete when the crown lawyers of Charles II. ventured to revive it on so extensive a scale. The selection of this mode of proceeding as a matter of course is a proof of the purpose of it was dishonest. 'The crown lawyers, more violent than learned,' observes Mr. Willecock, in the introduction to his 'Law of Municipal Corporations,' instead of first proceeding by esse factus to repeal the charters on pretence of forfeiture, which they had given the subsequent judgments at least the semblance of being conclusive, mistook their proceeding, and by filing informations in the nature of quo warranto against all the obnoxious corporations, proceeded in such a manner that it was impossible to discharge the municipal corporations of their charges against them, since it could be sustained only under very gross proofs; either that there were no such corporations ever established, and the bodies assuming to act as such were merely self-constituted; or to which the charters and well-known usage were a manifest contradiction; or that all the corporations had been dissolved for want of a sufficient number of officers and members, and the persons assuming to act as such were all mere usurpers; to which the very form of the information offered a plain inconsistency, by admitting that the charters were in force, the officers were charged with being false; as the measure was, judges were found* vile enough for the royal purpose.' London, which in latter times had usually taken the lead in asserting the political independence of the more important English municipalities, and the example of which, from this, in confirmation of its justice, its power, its wealth and power, had ever been so influential, was selected as the first object of attack. At this particular time it was in especial disfavour; for the king having, with a view to deprive the last parliament which he held of the encouragement which was derived from the victory of that powerful and independent city, summoned it to meet at Oxford. London not only re-elected the members which it had returned to the last parliament at Westminster, but voted at the thanks for their spirited conduct. Now, therefore, 'after the long silence, we have heard on the proceedings against London, judgment was given of seizure of its franchise to be a corporation into the king's hands, as forfeited.' The determination of the interference against the metropolis spread consternation throughout the kingdom, by the assistance of which and the intrigues of the court party, almost all the other municipalities were prevailed on either to suffer judgment against them by default, of which the crown made a use as erroneous as of the original proceeding, by treating it as a final and conclusive judgment. In the hope of conciliating the despot's favour. Here, too, the crown lawyers lost the law, or, confiding in the plenteous of arbitrary prerogative, thought its rules unworthy their consideration. New charters were granted without using the quo warranto. The suddenness of which they were wholly inopportune, even should we admit that a municipal corporation has power to surrender the franchise of being a corporation.

The labours of this prince were productive of no advantage to his subjects. The conduct of his ministers, the servility of judges, and the verdicts of party juries, effected the subversion of the corporations and promised a parliament venal as the realm could produce, his alarm at any assembly which might pretend to represent the people. The state of public credit, had never been so great, that he deferred the period of their convention until death undermined the system of contrivance which with his management might have subverted the constitution. This system soon fell after it came under the management of a successor, against whom the whole nation was exasperated. The first and only parliament of James II. displayed the full influence of his brother's measures—the power of the crown, the corruption of the crown and vesting the election of their magistrates in the select classes; a parliament convened ready to forge chains for themselves and the nation,—a parliament whose servility needed only a little duplicity in the king to render it useful in the most important concerns of the state. After having tried in vain to avulse himself of his brother's arrangements, endeavouring when too late to regain popular favour, abandoned them in despair, and issued a proclamation to restore corporations to their original state.

Some of the former officers of quo warranto, or a more constitutional reign; but the select classes of corporations, unwilling to relinquish the influence they had acquired under the new constitutions of Charles, still retained in their grasp the municipal power, and by this means prevented the restoration of popular elections. It was a new case for the tribunals. The operation of the recent proceedings under the shadow of legal form, and of such surrenders and new incorporations, was not generally understood. Many of the former officers had died or removed from the municipalities with which they had been connected; the aristocratic ascendency was not easily overthrown. The doctrine of the case of corporations, above cited, 'that by a bye-law the corporations at large might be divested of the elective vote, that it might by the same method be reposed in the select classes, and that modern usage was sufficient proof of the existence of the same,' was again made to produce the constitution of corporations in the form instituted by Charles, under pretext of lost bye-laws, after the charters were profession ejected.

So dilatory and expensive was it for the freemen to vindicate their rights, so much were they under the private control of the members of the select classes, so easy was it by compromise with the more active individuals to defer the inquiry, and so unimportant this franchise in some cases appear, that at the present day many corporations are extinguished by the processes of their management, and their proceedings have long since fallen into disuse. The information in the nature of a Quo Warranto has been moulded into a regular form of action by the statute of the ninth year of the reign of Anne, aided by that of the thirty-second of George III; and the several points on this part of the law were not settled until the decision of the case of Chester, in the House of Lords, after two trials in the country and one at bar. Since the abdication of King James, the government has abstained from open interference with the liberties of corporations; but they have been incessantly disturbed by the incursions of the tribunals of the crown, for the cause of the returns of members to parliament, the effect of which has been to bring them more frequently under the inspection of the Court of King's Bench, and to introduce a new system of legal proceedings for the investigation of their conduct. The ancient writ of Quo Warranto has long since fallen into disuse. The information in the nature of a Quo Warranto has been moulded into a regular form of action by the statute of the ninth year of the reign of Anne, aided by that of the thirty-second of George III; and the statute of the twentieth of the reign of Anne has also assumed a similar regularity through the liberal interpretation of the statute of Queen Anne, and those of the eleventh and twelfth years of George III.'

* Pemberton, Chief Justice of the King's Bench, was removed to be Chief Justice of the Common Pleas; and Saunders, who had drawn the pleadings and advised the part of the crown, was raised to be Chief Justice of the King's Bench just before the term in which the judgment was given.

2 D 2
Lords or the withholding of the royal assent, to procure it to be passed at the palatine county of Durham, as well as that of Chester, should send representatives to the Commons' House, it was at length passed into an act, so that the city of Durham, as well as the county, should thenceforth send two members; and two members were granted to Newcastle on the Tyne, in reward of its exertions for Charles I. during the civil war.

It may be remarked, that in the assembly which addressed the Prince of Orange to issue letters for a convention parliament, the city of London again figured very prominently; the mayor, aldermen, and fifty of the common council, being added to the invitation sent to all who had sat in any House of Commons during the reign of Charles II.

The last important modification in the exercise of the parliamentary franchise in cities and boroughs generally, especially in the clerical class, was the provision of an act of the ninth year of Queen Anne, which disqualified every person (except the eldest son of a peer or of a person qualified to be a knight of the shire) from becoming a member for a city, borough, or port, who is not possessed of a freehold or copyhold estate of 300l. annual value, clear of all incumbrances.

Both the Corporation Act, already specified, and the Test Act, which required every officer, civil or military, to receive the Lord's Supper according to the forms of the Established Church, and to make the declaration against transubstantiation, have been in operation since the year 1698. When, in the year 1828, after their repeal had long been advocated by the liberal opposition in the House of Commons, it was made a government measure, and passed into an act.

For some time previous the public opinion against the exclusion of the clergy from the franchise in the House of Commons had so far preponderated, that it was usual, at the close of each session of parliament, to pass an act to indemnify such as had exercised office without complying with their resolution.

This measure, and the more important one which speedily followed it, the complete political emancipation of the Roman Catholics, were passed without any direct view to the amelioration of the representative system. The revolution of 1833, as we have seen, though it restored a popular constitution to the monarchical system that had long been deprived of it, removed none of the vices in the general system. The history of the long period between that event and the introduction of the bill for an extensive and systematic amelioration of the representative system, brought into the House of Commons by the ministers of the crown in 1831, is in a great measure the history of the transfer, from various causes, of the political influence over parliamentary boroughs from the hands of the crown, which, for two centuries, had moulded and adapted them to be an influence to those of the proprietors of the boroughs, among whom were always many members of the House of Lords. Thus there arose a new and unprecedented parliamentary system. That command of a majority of borough votes in the House of Commons, which either the late or the present ministers had wanted means to realize, was obtained in the course of the last century, through the vastly augmented amount of government patronage arising from the great increase of the army, navy, colonies, and other public departments, the establishment and rapid growth of the commonwealth, we have before recorded, and by the manipulation of an admixture with any considerable portion of the public.

It belongs to the general history of the House of Commons to bring out the progress of the great question of 'parliamentary reform,' as the desired object of the representatives of the House of parliament was so long designated.

---

We now come to consider the operation of the great change in the political relations of the cities and boroughs, in bringing about the change in their municipal constitutions. In the following new order of movements which received its first impulse from the Reform Act, we may already trace a progress of the reverse of that which had been going on for centuries before. As the vitiation of the municipal constitutions of the towns had been requisite to prepare the way for their political prostration,—so their political emancipation now appeared essential in the extension of the municipal system of government, and it was operated in various ways to force the state of the municipal system into consideration. In the first place, the extinction of the most extremely insignificant or decayed parliamentary boroughs under that Act,—the extension of the franchise to the holders of freeholds in towns immediately operating with the growth of the places beyond their antient limits,—the disfranchisement of the great modern towns,—and above all, the vesting of the franchise substantially in the inhabitant householders,—all combined to exhibit in strong relief the great defects of the yet standing corporation system. The almost superhuman reverence and honor attached to corporations—a reverence which the mystic language of crown lawyers respecting them had constantly been cherishing,—was now utterly dissolved; and men were in a condition to place coolly side by side in their contemplations of public institutions the interests of the corporation itself, and the character of the associated bodies which asserted an imprescriptible right to act as the only instrument for attaining those ends.

One singular result of the mystery which, for purposes which have been sufficiently indicated, had been thrown about the being and end of a corporation, now became distinctly apparent. So little, it should seem, had it been understood that good local government should be the primary object of this body's existence, that in the local elections of parliament which in times past were held for the improvement of nearly all the more considerable towns, the superintendent of the police, and the powers necessary for watching, paving, lighting, cleansing, and supplying the towns with water, instead of being intrusted to the interests of the corporation, were committed to various distinct and independent bodies,—although none of these towns were too extensive to be embraced by one system of municipal government;—not indeed that the inhabitants in any case desired that their municipal authorities should exercise these new powers; for although they had not yet discovered what or should be the use of a municipal corporation, they were convinced that in the great majority of instances, constituted as it then was, it was not an engine working to the production of their local welfare.

It is the less wonderful that the inhabitants of corporate towns should have come to this conclusion, when we find, as appeared in the recent inquiry, that few corporations admitted any positive obligation to spend the surplus of their income for objects of public advantage. They regarded such expenditure as a spontaneous act of private generosity, rather than a well-considered application of the public revenue; and the credit to which the corporation, in such a case, generally considered itself entitled, was not that of a public corporation, but that which flowed from the individual property; and accordingly we find that at Cambridge the practice of turning the corporation property to the profit of individuals was avowed and defended before the municipal commissioners by a member of the common council. The following example of the effect upon the local affairs of those boroughs in particular which it wholly disinfraction, and of others in which it destroyed the exclusive influence, afforded additional illustration at least as to what was not the use of a municipal corporation in their own particular boroughs. The corporation were inadequate to the wants of the municipality, and the deficiency had been supplied either from the funds of the patron or by the members for the borough. In some, before the passing of the Reform Act, the members or the patron paid all the municipal expenses; but since that epoch these
contribution had ceased, and such corporations had no longer the means of maintaining municipal institutions of any great importance. Great corporations had been granted to the borough upon its disfranchisement, and the corporations books and accounts had not been found since; nor had any new mayor been elected until the year in which the late
commission of municipal inquiry issued.
John Adney, M.P., addressed to the House of Commons, this royal commission to inquire as to the existing state of the municipal corporations in England and Wales, and to collect information respecting the defects in their constitution; and to make inquiry also into their jurisdictions and peculiar institutions of justice, and in all other respects; and also into the mode in which elections and appointments of the members and officers of such corporations, and into the privileges of the freemen and other members thereof, and into the nature and management of the income, revenues, and property of the said corporations, and into the several local jurisdictions in the several towns, cities, and boroughs in England and Wales, was issued in July, 1833; and the general report of the commissioners was laid before the king, and before the House of Commons, who ordered it to be printed, in March, 1835. On this general report, with the particular reports upon the several places appended to it, was founded the ministerial bill for the regulation of municipal corporations in England and Wales.

The total number of municipal corporations in England and Wales was found by the commissioners to be 246. A considerable number, it is true, has ceased to exist; and the remainder, in most cases, have undergone a great transformation, being left for future legislation, and London, the greatest and most complicated of all, with its many wealthy trading companies, each an important corporation, being reserved as the subject of a distinct bill not yet brought in. The third section of the Act, as to the towns, and ports, reconstituted, under the general name of 'boroughs,' by the Municipal Reform Act, is 178. The act arranges these in two schedules, each divided into two sections. The first schedule (A) comprises those boroughs which any positively have a commission of the peace. Their number is 128, and includes all those whose population is large enough to admit of their division into two or more wards, as also a certain number of those which are not to be divided; the members of their respective councils to be elected under the act, varying, according to the population, from 4 aldermen and 12 councillors, which is the number for Aberystwyth, Abingdon, Andover, &c., and the lowest number allotted by the Act, up to 16 aldermen and 48 councillors, the highest number fixed by the Act, and assigned only to Bristol, Leeds, Liverpool, and Norwich. The schedule is arranged in two sections; the first comprises those boroughs, 84 in number, the enlarged parliamentary limits of which, as settled by the Boundary Act accompanying the Parliamentary Reform Act for England and Wales, have not been altered by act of parliament. These, of course, are all parliamentary boroughs as well as municipal. They are:

The second section of this schedule contains those boroughs, in number 44, the municipal limits of which are to remain as before the passing of this Act, until altered by act of parliament. Of these 29 are also parliamentary; viz. Chichester, Chichester, Clitheroe, Coventry, Exeter, Falmouth, Grantham, Grimby, Hastings, Lancaster, Lincoln, Liskeard, Ludlow, Maidstone, Maldon, Plymouth, Pontefract, Rich mond, St. Ives, Twekebury, Walsall, Welwyn, Went

and 15 are municipal only:

- Bideford, Chesterfield, Congleton, Deal, Doncaster, Gravesend, Kingston-upon-Thames, Louth, Newbury, Oswestry, Penzance, Romsey, Saunton Warden, Stockton, Wisbech.

The second schedule (B) comprises that portion of the boroughs of the smallest class not divided into wards, and having only 4 aldermen and 12 councillors, which are not to have a commission of the peace, except upon petition of their council and grant by the crown. This schedule, too, is divided into two sections, after the same manner as the first. The first section comprises those parochial boroughs whose parliamentary boundary is to be taken until further legislation, in number 9:

- Arundel, Beaumaris, Cardigan, Llanlo稽, Pwllhe, Ruthin, Tenby, Thetford, Totnes.

The second section of this schedule, whose municipal limits are to remain as before the Act until altered by parliament, 23 are also parliamentary:

And 18 are municipal only:

The fixing of the new municipal boundaries is the task of a distinct commission, which has been actively at work since the passing of the act. Anciently there was no distinction between municipal and parliamentary limits, because it was by virtue of its being a municipal town that each borough sent representatives. But in fixing the new parliamentary limits under the Reform Act, regard was had to various circumstances, which, in many instances, occasioned the tracing of a boundary much too wide to serve conveniently as the limit of a borough inhabitancy. In many cases however it is probable that the boundaries will remain as they were before the Act, especially in those larger parliamentary boroughs whose great amount of population made it least necessary, in settling their limits, to describe a circuit extending far beyond the more densely inhabited space.

Besides the general inadequacy at the present day of the antient borough limits in the more populous towns there were two other classes of anomalies in the old system, in relation to this matter, which it is of some importance to notice. The first was, that in some cases, as at Grantham where the borough limits included the town of Bercow, but not included outlyng parishes of ground. The most remarkable instances of this occur in the Cinque Ports. At Hastings, for instance, the corporate magistrates had authority, amongst other places, over two detached precincts distant from that town forty and fifty miles respectively. And the town of Ramsgate, as well as the corporate town of Deal, both at some distance from Sandwich, were under the jurisdiction of the corporation of the latter town. The second class of these anomalies consisted in the precincts being often loosely situated within the limits of the borough, and not included outlyng parishes of ground. Such existed at York, Lincoln, Norwich, Winchester, and Chichester. These had usually originated in ecclesiastical privileges, or had been the site of the castle of the lord of the borough. In the city of Canterbury there were fifteen such precincts, though some of them were in dispute between the county of Kent and the county of the city.

The Municipal Reform Act removes both the above descriptions of inconveniences. In each borough every place included within the general limits of the borough in the schedules is to form part of that borough; but any place hitherto forming part of a city or borough, but not included within the boundary thus indicated, is henceforward to be held as part of the county within which it is locally situated, and not as part of the borough.
of the electoral body; the second division regards its organization for the purposes of local legislation, taxation, and the other branches of public economy, as the administration of public property, whether absolute or in trust; the maintaining of surveillance, and payment of magistrates, officers of justice, police, and other departments; the maintenance of public works and buildings; the paving, lighting, and cleansing of the town; the maintaining and improvement of thoroughfares, and supply of water. The third division, or the municipal corporation, reserves to itself all local judicature, comprising all that relates to the constitution and powers of the local courts and magistrates.

To make the municipal change now effecting distinctly intelligible, we shall compare, under each of these heads, the state of the municipalities previous to the late Act, with the several provisions of the Act itself.

I.—Municipal Organization.

1. Electoral Body or Local Constituency.

Most of the governing charters incorporated the men and inhabitants of the borough; yet, though very few of them unequivocally designated the corporate body as a small and definite number of persons, custom (supported by the silence of the charters as to any general right to the franchise, and by its disuse and oblivion where any such might formerly have existed) had in many places practically established the same restricted constitution. A very numerous class of corporations existed which might be considered as occupying a middle place between those in which the number of corporators was indefinite and fixed by law, and those in which the number was now treated as necessarily definite: this class consisted of the corporations in which, although there is no doubt, both from the wording of the charters and the modern practice, that the number of corporators might be indefinite, it had been the policy of the settlers to restrict the number, so as to retain all the privileges constitutionally belonging to a large and indefinite body in the hands of a small one.

In a great proportion of the instances in which the number of corporators was both in constitution and fact, large and indefinite, the restriction in the management of the corporate affairs: this prevailed to so great an extent, that in such corporations the municipal commissioners often found that the freemen had long ceased to consider themselves as a part of the corporation; which term, in popular language, was applied exclusively to the ruling body. In some places this notion had been further refined upon, and a distinction drawn in the large indefinite body of corporators, between those elected by the ruling body and those claiming by an independent right, the former being treated as forming an integral part of the corporation.

In those boroughs where the number of corporators was definite, or had always been kept small, the principal mode of entering the corporation was by nomination of the ruling body, or by the election of corporators. The persons qualified, the most usual qualification being residence in the borough; in others the choice was uncontrolled by any conditions. This mode of acquiring the freedom was usually said to be by gift or purchase; and in fact, a sum of money varying with the circumstances of the corporation and supposed value of the franchise, was usually paid by each corporator on his election. In the boroughs where, both by charter and in practice, the number of corporators was unlimited, the circumstances under which the freedom was delivered of right were various; but almost all might be classed under the general titles of freedom by birth, by marriage, and by servitude. In a few places the possession or occupation of property gave a title to the freedom. Everywhere, a very few places only excepted, a distinction was made between the freemen and the inhabitants. The right of conferring the freedom by sale or free-gift was claimed and exercised by the ruling body of almost every corporation. Particular officers of the corporation or the mayor, by their authority allowed in a certain number of persons to be admitted to the freedom; but although this practice had nearly acquired the force of positive law, it is not distinguishable in its origin from the general power exercised by the ruling body, who sometimes in the exercise of this power have simply acquiesced in their officers' nomination.

In many towns, as still in London, it was necessary, in order to complete his title, that the party should first be admitted a member of certain guilds or trading companies of antiquated institution within the borough, and still preserving various degrees of connexion with, and subordination to the municipal corporation; a practice which seems to have been inherited from former times. To the grant of a right of admission to these guilds was usually of the same kind as that by which the municipal corporation itself was entered. These guilds were also accommodate to admit by purchase; but such purchasers neither acquired the right of voting, nor could they be admitted directly to the municipal corporation. Occasionally, an incorporated guild has continued to exist after its connexion with the municipal corporation has been almost or wholly dissolved.

The titles from birth, marriage, and apprenticeship, were very various and sometimes peculiar. In some, the right by birth was enjoyed only by the children of freemen within the borough; in others, by children of freemen wherever born; in some, the father's admission at any time conferred the inchoate right on all his children wherever born; in others, only on those born after, and in many, only on the first son born after his admission. Less variety is found in the nature of the title which a freeman's daughter or widow must possess, to enable her to convey the privilege. The right by apprenticeship has usually accrued by service under indentures for seven years to a freeman within the borough: service at sea has generally been considered in the light of service within the borough where the vessel belonged to its port: in some boroughs having trading companies, the binding and service must be to one of the company in the trade peculiar to that company.

2. Freemen. Freemen and corporators are terms of popular application to the corporate bodies used independently of the communities in which they were. In most of them, the right to the freedom, or citizenship, or burgesship, had been restricted to a much smaller class than that which formerly possessed it. Without enquiring of the municipal commissioners, 'when corporations in this country assumed their present form, it may be safely asserted that the body, however named, which was originally intended to share, and which in fact did share, in the rights which the early charters confounded, must have been the great body of the inhabitants. By degrees, exclusive qualifications were insisted on with increasing strictness, and with new exceptions, as the privileges to which these exclusive bodies laid claim rose in importance. Thus importance again was enhanced by the narrowing of the access to the privilege, and the consequent diminution of the number of individuals sharing in its advantages.'

Accordingly in most places all identity of interest between the corporation and the inhabitants had disappeared. This fact is the cause of the great number of independent freemen. It appeared in a more striking degree as the powers of the corporation became restricted to smaller proportions of the resident population, and still more glaringly when the local privileges had been conferred on non-resident freemasons. The term freeman, say the commissioners, 'they rightfully ought to belong.' Some corporations, indeed, were occasionally spoken of as exercising their privileges through a popular body; but in the widest sense in which the term popular body was applied to corporations, it designated only the whole body of freemen; and in most towns the freemen were a small number compared with the respectable inhabitants interested in their municipal government, and possessing every qualification, except a legal one, to take part in it. In the boroughs with a large resident population, including Devonport, exceeding 75,000, the number of freemen was only 437, of whom 145 were non-resident. In Norwich, the great majority of inhabitant householders and rate-payers were excluded from the corporate body; while paupers, lodgers, and others, paying neither rates nor taxes, were admitted to the functions of freemen, and were a considerable part of the corporation. The case of Ipswich affords another remarkable illustration. Out of more than 200 inhabitants, the resident freemen formed about a fifth; these were all rated; of the remainder, the majority were not rated; and of those who were rated many were exempted payment. About one-ninth of the whole were paupers. More than 11-12ths of all the property assessed in this borough belonged to those excluded from the corporation. Of the inhabited houses, exempted for municipal purposes, less than 1-15th were freemen; and the assessed taxes paid in the borough less than 1-20th was paid
by the whole corporate body. The condition of these free-
men exposed them to bribery and undue influence, and
advantage was taken of that condition to establish the most
demoralizing practices. A further illustration of the vast
dispersal existing under the old system between the actual
basis of constituency and the legislative house, to which
would have suggested, appears in a table given in the com-
misurers' Report, of sixteen of the largest English cities
and boroughs, which, with a collective population of 715,702
within their partial boundaries, had only 54,697
freemen of all classes, resident within that
political importance which the election of members
of parliament has in later times conferred upon these go-
vernning bodies, and the rewards for political services thus
henceforth made within the reach of the ruling corporators, had
caused the exercise of the public offices by the latter to be
often regarded as the sole purpose of a municipal institu-
tion; and in some boroughs this right has even survived all
other traces of municipal authority. The custom of keep-
ing the corporators as far as possible is preferable rather to
this cause than to the mere desire of monopolizing the mu-
nicipal authority, which has been coveted almost exclu-
sively as the means of securing the other and more highly
prized privilege. Hence a great number of corporations
have been preserved solely as political engines, the re-
spective towns having on an indefinite period the
benefit from their existence. 'To maintain the political ascend-
ancy of a party,' say the commissioners, 'or the political
influence of a family, has been the one end and object for
which the powers intrusted to a numerous class of these bodies
have been exercised; that the revenues arising from such a
usage, and much of the property inseparable from the view of
the same premises. Any person occupying as above stated
may claim to be rated to the relief of the poor, whether the
landlord of the premises be liable to be so rated or not. And
in the event of his so occupying, or of the landlord of the
rate last payable, the overseers are bound to put his name upon
the rate; and if they omit to do so, he is still to be
debted to be deemed from the period of making such rate.
And where any such premises shall come to any person by
descent, marriage, marriage and settled tenures, or by any
tenure, he will be entitled to reckon the occupancy and rating of the former possessor as his
own, and to add it to his own period of occupancy for the
purpose of enrolment as a burgess. No person may be
so rated as burgess, unless he has been so rated for a
period of at least five years, and that at a rate of at least
August in any year shall have received parochial relief or
other alms, or any pension or charitable allowance from any
fund held by trustees in the borough; but neither charitable
medical or surgical aid given by trustees of the borough,
or any education, or aid in any public or endowed school,
is to disqualify for enrolment.
On the 5th of September in every year, the overseers of
the poor of each parish or township, wholly or partly within
any borough, are to make out an alphabetical list, to be
sent to the burgess of each of them who shall be entitled,
by the qualification above stated, to be enrolled in the
burgess-roll of that year in respect of property within such
parish, &c.; inserting therein the Christian name and sur-
name of each person at full length, the nature of the pro-
"
The burgesses-lists, when revised by the mayor and two assessors (elected as hereafter described), and signed (as provided for in the Act), are to be delivered by the mayor to the town-clerk, who is to keep them, and cause them to be accurately copied into one general alphabetical list, in a book provided by him for that purpose, with every name numbered in regular series. If any burgess be rated for distinct premises in more wards than one, he will be entered to be rated in each, and the vote in such ward as he shall select, but not in more than one. And for the better ascertaining who are the burgesses of any ward, the town-clerk of any borough divided into wards is to cause the burgess-roll to be made out in alphabetical lists of the burgesses of each of the several wards. Lists are to be completed on or before the 22nd of October in every year; and the town-clerk, at the expiration of his office, must deliver them, together with the lists, to his successor. Every such book into which the burgesses-lists have been copied, is to be the burgesses-roll of the burgesses of the borough entitled to vote in any election of councillors, assessors, or auditors of the borough that may take place between the 1st of November inclusive in the year in which such burgess-roll shall have been made, and the 1st of November in the following year. The addition, registration, and enrollment of burgesses are to be free from stamp-duty, which, in a large proportion of cases, formed, under the old system, the heaviest part of the expense of admissions to borough freedom.

The town-clerk is also to cause copies of the burgess-roll in every constituency to be printed or printed, and is to dispose of them to all persons applying for copies, at a reasonable price for each. The proceeds of the sale of these, of the overseers' lists, and of the lists of claims and objections, are to be paid to the treasurer of the borough on account of the borough. With the expense of their preservation, are to be defrayed; and the council are to reimburse the overseers of the poor, out of the borough fund, all reasonable expenses incurred by them in relation to the burgesses-lists.

The reader may refer to the Act itself, or to the abstract in the 'Companion to the Almanac for 1836,' for many of the details of this and other parts of the Act, which it would be unnecessary to insert here.

II.—ORGANIZATION FOR LOCAL GOVERNMENT.

This part of our subject involves the consideration of three distinct though closely related departments, the legislature, the executive, and the ministerial.

Under the late system the legislative body generally consisted of a single select assembly called the common council, presided over by the executive officer of the municipality, or mayor; as Inverness, Carpathan, and Berwick-upon-Tweed, it consisted of the freemen at large. The body of the council however was often composed of two classes, the superior class being generally designated as aldermen, the inferior simply as common councillors. In many places the aldermen, or those of analogous station in the corporation, had real municipal powers beyond those of the other members of the council; in others the distinction was merely honorary; in a few there were more than two classes in the common council; in many, the city council was the only body of councillors. If a city council was necessary to constitute it a legal assembly, the instances being rare in which the aldermen met also by themselves as a separate deliberative chamber; although in some, as at Hull and Pontefract, the executive officer and the aldermen, or analogous functionaries, constituted the whole council. The recorder, a legal officer, was occasionally constituted by charter a member of the common council; and in some towns other corporate officers were members of it ex officio. The same form of legislation, by a mayor and council of aldermen, has been observed in corporations whose number was definite, and in those in which the number, though indefinite, had been purposely kept low; in the former case, the common council generally comprised the whole corporation, and in the latter nearly the whole.

The members of the council were elected, in the great majority of instances, by the council itself, or by that division of it commonly designated as aldermen. In some cases they were nominated by the executive municipal officers usually termed mayor. The election was generally for one, two, or three years, for the mayor, and common council. Here, as in many other instances of the dismissals of those who really constitute the executive department, by large bodies of freemen, both of aldermen and common council, the latter in both cities being chosen annually.

The functions of the governing councils, which the original charters of most boroughs must be considered as having assigned to them, fall under four distinct heads—the appointment of officers, the making of bye-laws or local regulations, the levying of the various denominations of rates or local taxes, and the management of the corporate property and revenues. In a sometimes noted by the members of the executive council, many bye-laws had long fallen into disuse. In some cases they were offered for approval or confirmation to a more popular assembly; and some charters required them to be approved by the judges of assize. Many corporations had the power of enforcing their bye-laws by fine and imprisonment, but these powers had of late been little exercised. In scarcely any instance have the members of the council, as such, legally received any salary or emolument. In London indeed allowances are made for regular attendance on the corporation, but inasmuch as the business is prepared for the consideration of the common council.

The acknowledged defects in the late legislative constitution of the English boroughs bear a close affinity to those above indicated in the composition of the general constitution of the British constitution. In the first place, the exclusive and party spirit which belonged to the whole corporate body, appeared still more strikingly in the councils by which, in most cases, it was governed. It has been stated that the members of these councils were usually self-elected and for life. They were, as is commonly the case in one political party, their proceedings were usually directed to the advancement of that party's ascendency. Individuals of adverse political opinions were, in most cases, systematically excluded from the legislative council. Since the repeal of the Corporation and Test Acts, and the removal of the civil disabilities of the Roman Catholics, we find that either Catholics or Dissenters, though often forming a numerous, respectable, and wealthy portion of the inhabitants, have been chosen into the governing body. These councils, embodying the opinions of a single party, were intrusted with the entire management of magistracy, the executive, and the judicial, frequently of the superintendents of police, and were, or ought to have been, the leaders in every measure that concerned the welfare of their town; yet, so far from being the representatives either of its population or its property, they were, either by being hereditary, or by being elected by a very small body of electors, being for life, their proceedings were unchecked by any consciousness of responsibility. The discharge of their functions was rendered difficult by the dislike and suspicion which the mode of their election inevitably entailed upon them. Hence also the carelessness often observable in the performance of their duties; while persons well qualified for the council were excluded, sometimes for want of vacancies, sometimes through rejection by the electing body, sometimes through their own refusal to identify themselves with their party. Under the present system, they are to a great extent reprobated. The common council of London is cited by the constitution as the only exception to the system of self-election for life, and a remarkable instance of the absence of the consequent evils. Again, it has been part of the general system of close corporations, that all their affairs should be managed with the strictest secrecy, something even enforced by an act of the Crown, so that both charters and bye-laws were frequently violated with impunity.
The executive officer of the municipality, or 'head of the corporation,' as he has commonly been called, has, in all instances, been constituted by annual election. In a very few instances, however, the wapentakes of Tweed and Ipswich, the freemen at large had an unrestricted power of choosing any one from their own number. In some, they chose him from the aldermen or the common councillors; in others, from two or more nominated by the governing body. Most commonly, the court of aldermen or common council elected him from the aldermen or common councillors. In some places, he was presented by the jurors of the court leet. In several, the same person was eligible only after a given interval. In a great majority of the boroughs, the office is ex-officio, and usually a fixed term has been fixed for him, besides tolls, which have often been collected exclusively in his name and on his behalf. Having been generally expected to exercise hospitality towards the other members of the corporation, and distinguished visitors of the town, it is probable that the word at large being held in a public way than has been realized from the ordinary emoluments of the office. In some boroughs no emolument whatsoever has been attached to it.

In some cases, the duties of the mayor have been wholly neglected, either from want of capacity or will; occasionally from non-election. In others, the mayor and common councillors same mayor was continued from year to year; and in others it was customary to elect two or three individuals in rotation. The effect of entrusting his election to the freemen, constituted as their body has generally been, was to degrade the office. The charter usually limit the executive officer's power of appointing a deputy to occasions of his illness or necessity. By this, it was an implied condition of his holding that office. But although the mayor was usually resident, the practice of deviating from the charter by appointing a deputy for the whole year had been general.

Changes made by the Municipal Reform Act in the Constitution, Designation, and Powers of the Legislative Body.

It is here that the House of Peers in its legislative capacity has most decisively and importantly interposed. Leaving the constituency on the broad basis fixed for it by the first bill sent up from the Commons, that is, on the rate-paying qualification, more extensive than the 10l. suffrage of the parliamentary constituencies, it proceeded to re-model the simple constitution which the Commons had fixed for the governing councils. They had enacted that for the future three mayors should be elected annually: 

'1. The mayor and burgesses of such or such a borough, and the constitution of each as to be purely popular; the governing council, consisting of one class only, to be chosen one-third yearly by the burgesses at large, and subject to no qualifications except that of being able to introduce a distinct class of aldermen elected for a term of years, so that the future style of every corporation body is to be. The mayor, aldermen, and burgesses of the borough of —, and they have also made high pecuniary qualifications requisite for the holding of any officer, even as a member of the borough or local representative assembly. The governing council then, or local legislature of each borough, is to consist of a mayor, aldermen, and councillors, and to be called 'the council of the borough.'

The number of councillors is to be elected for each ward in which the division is to be fixed by the revising barristers who determine the limits of the wards; and who are, in assigning the proportions, to have regard to the number of persons rated, and the amount of the poor-rates paid in each respectively. The number of councillors in each ward is to be a number divisible by three (as one-third quire office every year), and the particulars of the wards and the limits of each ward are to be submitted to the king in council, and published in the 'London Gazette,' and a copy is to be deposited with the town-clerk of the borough.

The councillors are to be elected by the burgesses who have been nominated in each borough, and in boroughs divided into wards the councillors for each ward are to be elected by the burgesses of that ward only; and should the same person be elected councillor for more than one ward at the same election, he must make choice of one within three days or in default the mayor is to name the ward for which he shall serve. One-third of the number is to go out of office every year, and an annual election of one third of the whole number of councillors is to take place. The order in which those who may be chosen at the first election are actually to retire, is to be that of being returned by the smallest number of votes; and, in case of an equality of votes, the determination is to be made by a majority of the council; and after two-thirds have thus retired, those always who have been for the longest time in office without re-election are to go out; but they may be immediately re-elected if duly qualified.

The number of aldermen in every borough is to be one-third of the number of councillors. They are to be elected every third year by the council for the time being from the councilors, or from the burgesses qualified to be councilors, one-half of each being also elected for the terms of office at each election; so that each alderman will in fact be elected for six years. Immediately after the first election the aldermen who shall retire at the expiration of the first three years are to be named by the councilors, and afterwards the order of retiring will be that of the longest serving without re-election; but the retiring aldermen are not to vote at the election of a new alderman.

We shall here speak of the mayor only as head of the local legislature, leaving his executive and magisterial functions for their separate consideration. He is to be annually elected by the council out of the aldermen or councilors.

The property qualification for mayor, alderman, or councilor is the same; namely, in boroughs divided into four wards or more, the clear possession of 1000l. in real or personal estate, or being rated to the relief of the poor upon the annual value of not less than 30l.; and in boroughs not divided into wards, or divided into less than four, the clear possession of 500l., or being rated upon the annual value of 15l. In order to be elected councillor or alderman a person must be entitled to be on the burgess-roll of the borough; and during his continuance in either of these offices, or in that of mayor, he must also continue to possess the above-named qualification in property or rating to the relief of the poor.

Every person on being elected mayor, alderman, or councilor must make or subscribe before two or more aldermen or councilors the following declaration, or one to the same effect:—

I, A.B., having been elected mayor (or alderman, or (councilor) for the borough of —, do hereby declare that I take the same office upon my own, and will duly and faithfully fulfill the duties the test of my judgment and ability; [end in the case of the party being qualified by estate, any] — And I do hereby declare that I possessed on the [case may be] of an amount of 1000l., or 500l. [as the case may require], over and above what will satisfy all my debts.

The mayor and aldermen are to continue as officers of the council while they hold their respective offices, notwithstanding that it is provided that councilors shall go out of office at the end of three years.

No person in holy orders, or being the regular minister of a dissenting congregation, or holding any office or place of profit, or office of trust, gift or disposal of the council, or having directly or indirectly, by himself or his partner, any share or interest in any contract or employment connected with the council, is to be qualified to be elected, or to be a member of the council; but the proper number of members and the regulation of any public lighting, or supplying water to the borough, are not to be disqualified thereby.

Every person duly qualified who shall have been elected to the office of mayor, alderman, or councilor, must accept such office, or pay to the corporation such a fine, not ex-
ceeding 1000, in the case of mayor; or 50l. in the case of a borough or other corporate body, may be recovered, with full costs, by any one who will sue for it in any of his majesty's courts of record at Westminster.

Powers of the Council, and Regulation of its Meetings.—The appointment of officers, the enacting of local regulations, the levying, assessing, and the raising of local taxes, are distinctly recognized by the Act as the three principal powers to be exercised by the local legislature.

The council are to appoint the town-clerk, the treasurer, and such other officers as have been yearly appointed for the borough, or as they shall think necessary for the execution of the officers and duties of their several employments; and may discontinue such appointments as in their opinion may cease to be necessary; they may take such security as they think proper from each, and are to direct such allowances to be paid to the mayor, town-clerk, treasurer, and other officers as shall be found necessary, and to empower any ministerial officer of the corporation who may be in office at the date of the first election of councillors under this Act, and to fix the compensation to be paid to such officers, subject to appeal to the Lords of the Treasury.

It is also empowered to make bye-laws for the good rule and government of the borough, and for prevention and suppression of all such nuisances as are not already punishable in a summary manner by virtue of any act in force for the purpose of the town or borough, and for the prevention of all abuses, offences, not exceeding 5l. But all bye-laws must be made by two-thirds of the council at least, and are not to take effect until forty days after a copy shall have been sent, sealed with the borough seal, to one of the principal secretaries of state for the time being; and the same shall be in office during the sitting of the council in the borough—within which period the king in council may disallow any such bye-law wholly or in part, or fix some later day for its coming into force. The council are further empowered to levy a borough-rate and a watch-rate, and appoint a convenient officer, and to determine and fix the assessment for the better collection of the same; and to set apart a sum for the public benefit of the borough lands, tenements, &c. under certain restrictions.

All acts done by the council, and all questions brought before them, are to be decided by a majority of the members present; but the whole number present must not be less than four, and of the whole number of members present. The mayor, if present, is to preside; or, in his absence, such alderman, or in the absence of all the aldermen, such councilor, as the assembled council shall choose for chairman of that meeting; and the chairman is to have the casting vote. Minutes of the proceedings of all such meetings are to be kept, signed by the presiding member, and to be open to the inspection of any burgess, on payment of one shilling.

In every instance a summons, signed by the town-clerk, stating the business of the meeting, is to be left at the residence of each of the members of the council on Friday three days before the meeting, and no business is to be transacted at such meeting but that specified in the notice. There must be four quarterly meetings of the council in every year for the transaction of general business, of which no notice need be given.

Mayor, as an executive head of the borough under the new Act.—The mayor has already been spoken of as the president of the borough legislature. In this place we may mention that precedence within the borough is distinctly assigned to the mayor, as signed by the Act; and, in accordance with all previous usage, he is to be returning officer in all parliamentary boroughs, excepting those cities and towns which, being counties of themselves, have sheriffs of their own.

And if from any cause, in any borough wherein the mayor and returning officer, there be no mayor at the time of a parliamentary election, the council are to elect one of the aldermen to be returning officer. And in any case in which there shall be more than one mayor within the limits of a parliamentary borough, the mayor of that municipal borough to which the writ of election is directed is to be the returning officer.

A new class of officers, under the name of assessors, is created by the Act, to assist in each borough, and in each ward, to levy and collect the assessment; and the town-clerk, the treasurer, and the other officers there are to be two in boroughs not divided into wards, and two for each ward in boroughs which are so divided. They are to be annually elected by the burgesses at large; and their pecuniary qualification must be the same in every respect as that of councillors. Every person.
must accept office when elected; and must make and subscribe the declaration of acceptance and qualification within five days, as required in the case of mayor, alderman, and councillor.

The office of the assessors is, to revise the burgesses' lists in the town. They are not to be considered to hold for that purpose; to be present with the mayor or an alderman, in the respective boroughs or wards, at each annual election of councillors, auditors, and of those who are to succeed them in the office of assessor; and to ascertain and declare the result of such elections.

3. Ministerial Officers; their Appointment, Designation, Functions.

The chief ministerial officers of a borough, as hitherto constituted, have been the public secretary and general adviser of the corporation, called most frequently the town-clerk, though sometimes the common-clerk; and the treasurer, or depositary of the public revenue and keeper of the public accounts, commonly styled chamberlain. Both these officers have been appointed during good behaviour, usually by the common council; the former sometimes, and the latter in a great majority of instances, out of their own body.

In a few places, the town-clerk was named by the recorder, and occasionally he was nominated or approved by the freemen. Occasionally he was elected by the freemen from themselves; and in most, it was necessary that he should be a freeman. He was generally required to reside in the borough, and usually was an attorney. He had generally a salary, with a little additional inducement for holding the situation being the legal business, for which he was paid according to the usual scale of professional charges, or the introduction to private practice through his connexion with the members of the corporation.

The chamberlains have, in a few instances, been credited with the revenues, and have paid the requisite payments to the order of the competent authorities, keep the accounts, and superintend the corporation property. In some instances the head of the corporation acted as treasurer; in which case, as in many others, the chambers and the treasurer jointly, or the chambers alone, have the power of controlling the body of the council, even if they do not belong to the body which his accounts were audited. But in some large towns, as London, Bath, and Bristol, this has never been the case.

The chamberlain has sometimes paid by a poundage on the income collected by him, but more frequently as a salary, and by the profit of balances left in his hands in corporations where his receipts were considerable, he was often required to give security.

 Inferior officers were found, more or less numerous, in all the old large and small towns. These were either officers of ceremony, as sword-bearers, mace-bearers, &c., of police, as constables, sergeants at arms, and town-sergeants, and others, as beadle, clerks, &c., whose functions are sufficiently indicated by their appellations. There was, in almost all the larger towns, control of the proceedings of the governing body. Many of them had neither duties, fees, nor salaries; yet they were yearly elected and solemnly sworn to the fulfilment of their nominal functions, the corporations doubting whether they could legally cease to elect any officers in their charters. The common council of London however has assumed the authority of abolishing some useless offices, consolidating others, and attaching to them new and useful functions.

The Constitution of the Ministerial Officers.

'One vice,' say the commissioners, 'which we regard as inherent in the constitution of municipal corporations in England and Wales is, that officers chosen for particular functions are regarded as a necessary part of the legislative body.' More than nominal, it is to have, in sufficient times when the separation of constitutional authorities was not understood; when legislative, judicial, and executive functions were confounded. There are serious objections to the practice of allowing the mayor to act as the treasurer of the corporation, and to have in his office of one of the names is placed in the power over which he presides. In the convenience of an opposite kind occurs where several persons are required to concur in executing the duties of a single office.

To the extent to which some corporations carried the principle of treating the corporate offices as matter of mere patronage, is illustrated in the commissioners' general report, by two instances where, in two considerable towns, that principle had been applied to the very important office of town-clerk.

Ministerial Offices, as now to be regulated.—The new Act provides not for the discontinuance of useless offices, but for the more effective, regular, and faithful discharge of the duties of essential utility. The provisions for the town-clerk are still to be styled town-clerk; but for the designation of chamberlain, that of treasurer is in all cases to be substituted.

It is directed in the Act, that the council of every borough, on the 9th of November, 1835, shall appoint a fit person to be a town-clerk; but by order in council of October 6th, the first appointment of town-clerk under this Act was postponed to the 1st of January, 1836. The town-clerk so appointed is to hold his office during pleasure. He may be an attorney of one of the superior courts at Westminster, but he may also be any legal officer, judge, or counsel. To the contrary: he must give such security as the council may require, for the due execution of his office; but he must not be the treasurer of the borough, nor a member of the council, nor will he be eligible as auditor or assessor; and his salary is to be determined by the council, who may fill up any vacancy in the office by a fresh appointment.

The town-clerk of every borough is to perform the duties connected with the registering and enrolment of burgesses. In cities and boroughs returning a member or members to Parliament, he is to perform the duties of returning officer, and the due registration of the freemen or burgesses, according to the provisions of the Reform Act. He is to be exempted from serving on any jury, either in the borough, or in the county wherein the borough is situated. He is also to have the custody of the seal, and be the official officer of the council.

The council are directed to appoint every year a fit person to be treasurer; he is to give such security as the council may require. He must not be the town-clerk of the borough, nor a member of the council, nor will he be eligible as auditor or assessor. The salary is to be determined by the council, who may fill up any vacancy by a fresh appointment. He is to keep true accounts, entered in books kept for that purpose, of all sums received and paid by him, and of the several matters for which such sums shall have been received and paid. The books shall be open at all times to the inspection of any of the aldermen or councillors of the borough. And he is to submit all the accounts, with all vouchers and papers touching or relating to the auditing thereof, twice in every year; and after they have been examined and audited by the auditors in the month of September in every year, he is to make out in writing, and cause to be printed, a full abstract of his accounts for the year; a copy of which is to be open to the inspection of the auditors of the borough, and copies are to be delivered to all ratepayers applying for them, on payment of a reasonable price for each copy.

III. OPERATION OF OLD ORGANIZATION FOR LOCAL GOVERNMENT AND DIFFERENT METHODS UNDER THE REFORM ACT FOR ENGLAND AND WALES:—1. IN LOCAL REGULATIONS.—2. IN MANAGEMENT OF CORPORATE PROPERTY AND REVENUES.—3. IN LOCAL TAXATION.—4. AS TO SPECIFIC TRUSTS AND PATRONAGE.

1. Local Regulations.

The police belonging to municipal corporations, under the old system, was for the most part very insufficient. In a great many of towns there were no watchmen, nor police officers of any kind, except the constables, who were unpaid. The chief of the police, on occasions of great public safety, was the mayor, or some other person elected by the corporation, and the commissions of the peace to that person for the time being. There were courts of peace, the justices of the peace, who were the judges of the peace, and to its general municipal authority. Many of these had courts of pie-poudre, which were disliked in the majority of instances.

Already we have marred the general resort which has been made to the English Act for American Cities, and the old limitations of the deficiencies of the old municipal regulations; and that the superintendence of the police, and the powers necessary for watching, paving, lighting, cleansing, and supplying the towns with water, were for the most part committed, in each town, under these acts to one or more bodies of corporate commissioners, independent of the municipal corporation. Sometimes, indeed, these powers were shared between the corporate authorities and the commissioners; and often
many of the corporate functionaries were named in these acts as commissioners, by virtue of their corporate offices. But much confusion resulted from this divided authority. In several towns, owing to the general distrust of the corporate authorities, the inhabitants availed themselves of the provisions of these local acts. Great jealousy often subsisted between the officers of police acting under the corporation, and those under the local commissions: and the corporate body seldom took any active share in the duties of the board of which its members formed a part. At Bristol (one of the principal towns of which the corporations, after the Revolution, clung to the new governing charter imposed by Charles II.), a notoriously ineffective police could not be improved, chiefly through the jealousy subsisting between the corporation and the inhabitants. At Hull, owing to the disunion between the governing body and the inhabitants, arising chiefly out of a dispute about the tolls and duties, only seven persons attended to suppress a riot, out of a thousand who had been sworn in as special constables, and on another similar occasion none whatever attended. At Coventry serious riots and disturbances frequently occurred; and the officers of police, being usually chosen from one political party, often actively fomented them. In some instances the separate and conflicting acts of the corporation and commission were avowedly used to counterbalance the political influence of the corporation. An ineffectual endeavour to obviate the evils resulting from the want of a well-organized system has been made in some towns by subscriptions for private watchmen. Nor has the superintendence of lighting, which in some corporate towns has been hitherto in a more satisfactory state.

For the police of the reformed municipalities, the Act of 1835 makes, among others, the following uniform provisions:

The council, immediately after their first election, and from time to time, are to appoint, for such time as they may think proper, a watch committee, consisting of the mayor and a sufficient number of councillors, of whom three are to be citizens within the town within three weeks after their first appointment, and from time to time, this committee is to appoint, and cause to be sworn in before a justice having jurisdiction within the borough, a sufficient number of fit men to act as constables by day and night, for preserving the peace, preventing crimes, and for the better guarding and assisting the constables, as well as for the safety of them and their machinery, and for the use of the highway.

The constables are to have the usual powers, privileges, duties, and responsibilities, not only within the borough, but also in the county in which the borough or part of it is situated; every county that is within seven miles of any part of the borough is to be considered as being parts of the county; and are to obey all lawful commands of any justice of the peace having jurisdiction in such borough or county.

The treasurer of the borough is to pay such wages and allowances as the watch committee, subject to the approbation of the council, shall think fit, for men employed in the police, and also such sums as they may award, subject to the same approbation, as a reward for extraordinary diligence and exertion, or as compensation for wounds and injuries received in the performance of duty, or as an allowance to those engaged in the maintenance of the said machinery, and any other expenses for the constabulary force, so directed and approved; also any extraordinary expenses necessarily incurred in apprehending offenders and executing any orders of any justice of the peace for the borough, ordered by the council; and such expenses having been first approved by the justices.

Two or more justices having jurisdiction within any borough are, in the month of October in every year, to point, under their hands, so many inhabitants (not legally exempt) as they shall think fit, to act as special constables when required by a justice's warrant, reciting that in the opinion of the justice granting it the ordinary police force is insufficient at that time to maintain the peace. And every person so appointed shall be a constable within the Act of 1 & 2 Will. IV. cap. 41, and to have the powers and immunities, and be liable to the duties and penalties therein enacted; and is to receive out of the borough fund £3. 6d. for each day during which he is called out to act.

The watch committee, on the Ist of January, April, July, and October, in every year, are to transmit to one of the secretaries of state a report of the number of constables or policemen, the description of arms, accoutrements, clothing, and necessary, furnished to each man, their wages and allowances, and the number and situation of all station-houses in the borough; as also a copy of all rules, orders, &c., made from time to time for the regulation of the constables or policemen.

With a view to the merging in the general authority of the municipal council of the powers vested in so many of the boroughs, by the local acts of which we have already spoken, in the hands of independent boards of commissioners, it is provided that the trustees appointed by virtue of any Act of Parliament for the purpose of watching, regulating, supplying with water, or improving any borough or part thereof, wherein they or the persons whose trusts they may be are not beneficially interested, may, at a meeting called for that purpose, transfer, in writing under their hands, and sealed with their seals, the whole or any part of the powers and duties as if their names had been originally inserted in the act, or they had been elected under its provisions. A list of boroughs, and of the Acts of Parliament for the above-named purposes, the powers and duties under which the trustees are appointed, and to whom the powers and duties are transferred, is annexed to the council of such boroughs, is given in schedule (E) appended to the act; but it is provided that no such transfer shall be made of powers under the acts therein mentioned, relating to the town of Cambridge, with the consent of the magistrates and ratepayers. And in Schedule (F), the same is provided for the transfer of powers relating to lighting.

With respect to lighting, it is further provided that the council of any borough having a local act for lighting part thereof only, may make an order to include any other part within its provisions after a certain day named. And after such day it is to be so included, so far as relates to lighting or to any rates authorized to be levied for that purpose.

And every such part is to be lighted like the other parts of the borough, and to pay for that purpose a rate not exceeding the average expenses in the pound of the lighting of those other parts. If the council of any borough shall, by notice fixed in a public place within the borough, declare that on a certain day named (not within twenty-one days), they will take upon themselves the powers given to other corporations in the schedule (E), so far as it relates to lighting the whole or any part of a borough not within the provisions of any local act, or in which there is no power of levying rates for lighting, the council of such borough are to have, after the day named, the same powers as if the borough was named in the above-mentioned act, for lighting and levying rates for that purpose, so far as they are consistent with the provisions of this act.

And the council alone are to fix the sum to be called for in any year for lighting such part, which must not exceed sixpence on the pound, and every such sum is to be raised by rates levied in the borough. And every such rate is to be paid to the officers named in the schedule (E) of the above-mentioned act, and is to be paid to such officers by the council of the borough for the county, and in such case, the inhabitants of such part of the borough are not to have power to decide that the provisions of the above-named act shall cease to be acted upon.

2. Management of Corporate Property and Revenues.

Many of the old corporations had considerable revenues derived from various sources: from lands, leases of tithes, and other property; from tolls of markets and fairs; from tolls or other charges imposed on inward or outward traffic, on the importation of merchandise, commonly called town dues; from other duties, as quay dues, anchorage, &c.; and from fees payable on the admission of corporate officers and burgesses, as well as from various other sources. The corporation, through a refusing municipal office. In many corporations the revenue was sufficient for the maintenance of all necessary municipal institutions; but in these they were often but partially applied to really municipal purposes. In most, however, the commissioners declare that the revenue derived from these sources was not sufficient for any public purposes, even though they had been wholly expended upon them.

There were many instances among the parliamentary boroughs in which, the revenue being inadequate to the wants of the municipality, the deficiency had been supplied either by the political patronage of the borough. In some, before the passing of the Parliamentary Reform Act of 1832, the members or the patron paid all the municipal expenses; and these contributions having ceased since that time, such corporations have no longer had the means of maintaining municipal institutions of any kind.
In numerous instances, too, individual corporators were ac-
countable to receive pecuniary allowances from the patron; which source of revenue was not a proper measure since the passing of the Reform Act, a principal inducement to belong to the corporate body was thereby in many places taken away.

The income derived from market and fair tolls, and that from the proceeds of any other objects of general com-
plaint, grounded as well on the consideration that the money thus levied has seldom been applied for the good of the community, as on the vexatious and injurious nature of that kind of taxation—arising, in some places, from the exorbit-
ance of the tax—in others, as far as it seems, in order to limit the trade of the port; besides that, whatever may have been the origin of these tolls, in latter times they have been paid, in many instances, without any equivalent being rendered by the corporations which have enforced them. The levying of cessations, a tax intended to serve corporate offices has also been a source of rea-
sonable complaint, where such fines have been levied, not really for the purpose of compelling individuals to serve, but for the sake of increasing the funds of the corporation.

The management of these various offices from the vantage-
point of the corporate property. Some corporations have been accustomed to let their lands by private contract to members of their own body, on rents and at fines wholly disproportioned to their value, and frequently for long terms of years, and thus the corporation has been, more or less, to a certain extent, a property for inadequate considerations. In large towns how-
ever the prevalent species of malversation has been, not so much the clandestine appropriation of the corporate prop-
erty, as the misappropriation of the monies in the administra-
tion of the municipal funds, and an exclusive distribution of patronage among friends and partisans.

In some towns large sums have been spent in bribery and other illegal practices at contested parliamentary elections. The corporation of Leicester, for instance, in 1826, expended 10,000l. to secure the return of a political partisan, and mortgaged some of their property to discharge the liabilities thus incurred. At Barnstaple and Liverpool, in like man-
ner, the funds of the corporation have been wasted in de-
formity of the objects intended by them, in the hands of persons who had been proved guilty of bribery. In general, the corporate funds have been only partially applied to municipal purposes, as the providing an efficient police, the watching and lighting the town, &c., but have frequently been ex-
propriated and appropriated in the interests of important offices. The allowance to the head of the corporation was very often large; and it was well understood that he was to spend it in public entertainments. The practice of having periodical dinners, &c., for the members of the common council, at the cost of which a large part of the funds, if not of the corporate funds, was almost universal, and in some places consumed a large portion of the revenues.

The commissioners found the debt of many corporations to be extremely heavy, owing often to neglectful and impro-
per administration of the funds, in which the interest has absorbed a very large proportion of the income; others were absolutely insolvent. Many of the close corporations had become indebted to the patron of the borough for sums of money advanced to them for municipal and other purposes.

Some check might have been imposed on these abuses by the force of public opinion, had the corporate accounts been regularly kept and regularly subjected to public inspection; but so irregularly had they been kept, that in the course of the late municipal inquiry, the facts relating to the management of corporate property, the expenditure, and the debts, were in many places elicited with difficulty and imperfectly. In some places no accounts at all were kept; in others they were kept very incompletely; in very few was there any regular and efficient audit, and in still fewer any publication of them.

The new Act will be found to provide efficient remedies for these defects in the financial department of municipal government.

After the election of the treasurer, the rents and profits of all corporate offices, and the interest, dividends, and annual proceeds of all monies, dueces, chattels, and valuable se-
curities belonging to the former body corporate of such borough, named in the schedules (A) and (B), to any member or officer thereof in his corporate capacity, is a penalty fine for any offence against this act; the application of which is not otherwise therein provided for, is to be paid to

the treasurer of the borough, and to be carried by him to the
account of a fund to be called 'the borough fund.' This fund is the payment of legal debts due from the late body corporate contracted before the passing of this act, with all interest accruing while any part shall remain unredeemed, and saving all rights or claims in or upon the real or personal estate of such body corporate by virtue of any estate, trust, or right in law or equity, or by virtue

gorage or otherwise, is to be applied towards the payment of the salary of the mayor, and of the recorder and the police-

magistrate (where the latter functionaries shall be created), the salaries of the town-clerk, treasurer, and every other officer apportioned by the laws, as also towards the pay-
ment of the expenses incurred from time to time in pre-
paring burgess lists, ward lists, and notices, and in other matters connected with the borough elections, and for other necessary and useful purposes mentioned in the act.

This levy is not the payment of legal debts due from the late body corporate contracted before the passing of this act, with all interest accruing while any part shall remain unredeemed, and saving all rights or claims in or upon the real or personal estate of such body corporate by virtue of any estate, trust, or right in law or equity, or by virtue of any other source, or alienate any part of the borough lands, tenements, or hereditaments; and leases granted by them are to be for a term not exceeding thirty-one years from the date of the lease, or of a pre-
vious agreement, should there be one; and leases are to be at the particular rates without any fine: excepting that the yearly value of the property shall arise principally from buildings, or the property shall consist of land for the erec-
tion of buildings, on which the lessee shall covenant to erect buildings of greater yearly value than the land, or for lay-
ning out gardens, parks, or other appurtenances to buildings, in which case the lease may be for any term not exceeding seventy-five years.

In special cases the council may sell, or alienate, or de-

tate, or lease, or grant, for a term of years; or grant, by patent, or on the recommendation of the council, representing the circumstances to the Lords of the Treasury, and obtaining their approbation of the act, and of the terms and conditions; but in such case the council must give one month's notice, fixed in some public place in the borough, of their intended application, and the proceeds of the sale or grant be sent to the Lords of the Treasury must lie during that period in the town-clerk's office, open to the inspection of every burgess.

Not only the regular keeping and the publicity of accounts, but the importance of the financial department of bo-

tough government, the regular and responsible auditing of them, are now first uniformly and effectively provided for. Two auditors are to be elected for each borough or ward by the burgesses, in precisely the same manner as already de-

scribed in the inhabitants; and in the case of any suspension or absence of the regular financial audit, the auditors are to examine and audit the treasurer's accounts, in con-

junction with a member of the council to be named by the mayor.

3. Local Taxation.

Municipal taxation under the old system was as irregular as all its other financial arrangements. The almost uni-

versal persuasion on the part of the members of corpora-

tions, that the permanent income derived from rents, tills, &c., was entirely applicable to their private and public use, corporators themselves, and the consequent unprofitable expenditure of that income, called the powers of local tax-

ation, where the corporation possessed them, into additional activity, though generally with no equivalent advantage to the

inhabitants. The introduction, too, in so many places of local acts of parliament for the realization of objects of public utility, which, according to their nature, should have fallen strictly within the province of municipal administra-
tion, might have brought the boroughs into a collision with the boards of commissioners appointed under such acts. In some bor-

oughs the corporation levied on the inhabitants a rate in the nature of a county-rate, and destined to similar objects.

The Municipal Reform Act, as amended by the Municipal Rates Act, has opened the way for transferring the powers of the local boards to the municipal councils, and so introducing one general and uniform system of municipal taxation. After providing, as above described, for the faithful appropriation of the

income of the borough in public objects, it proceeds to direct how such additional funds are to be raised as may be necessary to defray the charges of those arrangements for the public convenience and security of which it ensures the execution.

4. Specific Trusts and Patronage.

Besides the property applicable to all municipal purposes,
various funds and revenues have at different times been entrusted to corporations for specific objects. Tolls and dues, for instance, have been granted for some purpose of local utility, as the maintenance of a navigation or a harbour, and granted for such purpose exclusively. Financial abuses, of the same nature as those which we have already noticed, have appeared in the management and application of those funds. Other corporations are connected with charitable institutions and the administration of charity funds; and here again we find mismanagement and misappropriation to a considerable extent: the patronage connected with these trusts has very often been secured by the corporate body, and used to fill general offices both in the municipal and the parliamentary elections. In many instances, too, the corporations have possessed ecclesiastical patronage, presenting to livings, and appointing lecturers; as well as the more obvious duties of churchwardens.

The new body corporate of any borough named in the schedules to the Municipal Reform Act are to be trustees for executing, through the council, the provisions of all Acts of Parliament made before the passing of this Act, and of all Acts which shall be necessary for the good government of the borough. They shall be members or nominees of the former corporation or any of its members as such, or any particular number of persons appointed by it, with certain exceptions. The mayor, aldermen, and other officers of the municipal body shall be freeholders or owner-occupiers, or shall have resided for ten years within the borough; and the mayor and corporation shall continue in office until the election of the new council. The council is to consist of as many members as the county council may from time to time determine. In each borough, there is to be an elected mayor, who is to be the chief executive officer of the borough council. The council is to have the power to levy and expend money for the purpose of carrying out the provisions of the Act.

As regards charitable trusts, it is deemed expedient that the obligations of the municipal corporation should be limited to the public funds of the municipality: therefore, wherever the former body corporate, or any of its members as such, or any particular number of persons appointed by it, or the council of the Mayor and corporation, or any other persons shall have been connected with any charitable trust, or have had any interest in the income thereof, the new corporation is not to hold or dispose of any such property or any interest therein.

The anticipated influx of dissenters into the new municipal councils rendered the ecclesiastical patronage of the corporations in many cases a source of pecuniary profit. In the event of municipal reform, the difficulty has been obviated thus: Where any former body corporate, or any number of its members or any particular number of persons appointed by it, possessed any property other than charitable trusts to which any adowson or right of present interest was attached, or possessed any adowson in gross, or any right so to present or nominate, such adowson, and right of presentation or nomination, is to be sold under the direction of the ecclesiastical commissioners, so that the best price may be obtained; the proceeds are to be applied to the public funds of the municipality. Any vacant curacy occurring before the effecting of such sale is directed to be filled up by the bishop of the diocese in which the prebend is situated.

IV. Organization for Local Jurisdiction.

Magistracy.—In almost all the principal boroughs there were municipal magistrates whose authority as justices of the peace extended over the whole borough. In some cases the county magistrates possessed a concurrent jurisdiction within the borough; but more commonly that of the county magistrates was exclusive; and even where the county magistrates possessed a concurrent jurisdiction within the municipal limits, they rarely exercised it. The head of the corporation was always the chief municipal magistrate named in the charters; and in some few instances he has been, by virtue of his municipal office, a magistrate also of the neighbouring county. In many of the large cities and boroughs all the aldermen were magistrates: in others only those who had 'passed the chair' is, who had served the executive office. At Norwich, the aldermen who had not passed the chair were magistrates in their several wards. In other towns only a certain number of the aldermen were elected, and only the senior aldermen were magistrates: in Doncaster, three aldermen were chosen to be magistrates as long as they continued aldermen: in Ripon, the two aldermen who had last been mayors were magistrates in Richmond, the last mayor only was so constituted.

The judicial officer styled Recorder was also usually one of the justices. The chief amount of magisterial business was done by the mayor: in some corporations his magisterial authority continued for a year, or a longer time beyond the term of his mayoralty, under the terms of the charter or by a customary election.

Defects, &c.—The magistrates were usually chosen from the aldermen, and the aldermen were generally political partizans. Hence, even in those cases where injustice was not absolutely committed, a strong suspicion of it was excited: so that the corporate magistrates generally were not regarded by the inhabitants with favour or respect, but often with positive distrust and dislike. In many places there were heavy complaints of their non-residence.

Municipal Reform Act.—Among the municipal officers, the mayor alone is to be a justice of the peace by virtue of his office, in every borough, not only during his year of office, but during the whole of the year next following, if he continue to be peculiarly qualified. The other executive officers are to be nominated by the mayor from the council at large, as shall be equal in number to the members or nominees of the former corporate body acting as such trustees or exercising such functions. As regards charitable trusts, it is deemed expedient that the obligations of the municipal corporation should be limited to the public funds of the municipality: therefore, wherever the former body corporate, or any of its members as such, or any particular number of persons appointed by it, or the council of the Mayor and corporation, or any other persons shall have been connected with any charitable trust, or have had any interest in the income thereof, the new corporation is not to hold or dispose of any such property or any interest therein.

The anticipated influx of dissenters into the new municipal councils rendered the ecclesiastical patronage of the corporations in many cases a source of pecuniary profit. In the event of municipal reform, the difficulty has been obviated thus: Where any former body corporate, or any number of its members or any particular number of persons appointed by it, possessed any property other than charitable trusts to which any adowson or right of present interest was attached, or possessed any adowson in gross, or any right so to present or nominate, such adowson, and right of presentation or nomination, is to be sold under the direction of the ecclesiastical commissioners, so that the best price may be obtained; the proceeds are to be applied to the public funds of the municipality. Any vacant curacy occurring before the effecting of such sale is directed to be filled up by the bishop of the diocese in which the prebend is situated.

The head of the corporation was always the chief municipal magistrate named in the charters; and in some few instances he has been, by virtue of his municipal office, a
Defects, &c.—The method of appointing this influential officer is reported by the English commissioners to have been often very objectionable. At Newport, in the Isle of Wight, for instance, he was appointed formally by the crown, but actually on the patron's dictation. On one occasion no person was chosen recorder there whose connexion with the patronage of the borough is not described; and, in other instances, for managing the property of a deceased patron. At Woodstock the office had been vacant for several years because the patron's nominee was opposed. In some boroughs the recorder was elected by one of those demoralized constituencies of freemen which we have already described; and, Berwick a recorder so chosen tried capital felonies. In some cases, too, this officer united functions improperly joined; as, for instance, when, living in the neighbourhood, he acted as a resident magistrate at the same time that, by virtue of his office, he sat on the corporation's court. In many instances he performed no duties whatever; and his nominal connexion with the borough was merely a form through which he exercised over it an uncontrolable power. The power of appointing deputies, as hitherto exercised, is strongly objected to by the commissioners. 'Such exercise,' say they, 'has been occasionally useful; but the practice of appointing a deputy permanently to discharge all the duties of the recorder has been very mischievous.'

Recorder under the new Act.—In the appointment of this lucrative office, for which, above all others, boroughs vie with each other, the new Act makes some improvements. The recorder's election is to be by the justices excluding the mayor, nomination by the crown to be substituted for election by the members of the corporation. The council of every borough, desirous of having a separate body of councillors, is to petition the king in council for one, who is to be a sort of municipal president of the state of the gaol, and the salary they will pay the recorder; and his Majesty, if he be pleased to grant such court, will appoint a recorder of the borough, or one for two or more boroughs conjointly, who is to be a barrister of five years' standing; with all the usual duties of a good barrister, or, when any vacancy occurs, appoint another such person to fill the office.

Town Clerk as a Judicial Officer.—In some boroughs the duties of town clerk have been separated from those of at-torney. The new Act requires that in all boroughs not containing an attorney, the clerk is to be the public prosecutor of the borough, and the office of justice of the peace be vested in the clerk; and it also empowers the recorder to appoint, on the same terms as before, a clerk to the magistrates, or justice's clerk; clerk of the peace, that is, of the criminal courts, in every borough. It also makes this clerk a member of the court of record, or civil court. Moreover, he was often appointed deputy recorder, and usually conducted inquests when the head of the corporation was coroner ex officio.

Deffects, &c.—'The most inconsiderate offices,' observe the commissioners, 'are the office of attorney, and that of the town-clerk. He very frequently acts as deputy recorder; which practice, in our opinion, cannot be too strongly condemned. He is often, practically, the principal attorney for the prosecution of offenders tried at the borough sessions, whereas, in former times, he had previously advised in the character of clerk to the magistrates. Even when his name does not appear to the prosecution, the same evil often ensues from its being in the hands of his partner. In York and Hull great complaints have been made of the conduct of the borough attorney, who has received by deputy the advantages which the rules of practice give him over other attorneys. In Preston the town-clerk is a member of the council, and his partner is the senior alderman, a magistrate, and a coroner. A strange incongruity, sometimes appears in the election of the town clerk to the office of mayor: in some places where this has occurred an attempt has been made to gloss over the irregularity, by appointing another town-clerk during the year of his mayorality. Whilst the same officer thus unites the characters of judge and prosecutor, he is entirely committed to his discretion, and it cannot be a matter of surprise that suspicions of unfairness and partiality should be excited.' In the civil courts, likewise, when the recorder did not attend, the town-clerk became the real judge, from the incompetence of the other magistrates to perform the duty. 'At Reading,' say the commissioners, 'the town-clerk, during his mayoralty, tried and taxed the costs of a cause in which his partner was one of the attorneys. In many towns, although he does not practise in the court of record as an attorney in his own name, he is the real attorney in the cause. At Kendal the town-clerk's partner, who is an alderman, practises in the civil court. At Wakefield, the same thing is also the case. The town-clerk acts as assessor in the civil court, and it also taxes the costs. This union of conflicting duties is very adverse to the proper administration of justice; it is a frequent cause of suspicion and jealousy amongst the inhabitants, even where the character of the officer is secured against improper conduct. It is justly the subject of complaint, that, the town-clerk should act as an attorney of the court, either in his own name or that of his partner or agent, as in fact it places the whole power over the proceedings of the court in the hands of an attorney.' Besides that the town-clerk often selected the juries in these as well as in the criminal courts.

Improvements, &c.—Provision is made by the Corporation Reform Act for obviating that vicious union of incompatible functions, especially in the magistral and judicial departments, which made the office of town-clerk one of the most inglorious anomalies in the old municipal system, and in particular for keeping the office of clerk of the peace distinct from that of clerk to the justices. The justice of the peace, upon which a separate commission of the peace shall be granted are to appoint a clerk, removable at his pleasure: but the clerk to the justices must not be an alderman or councillor of the borough; nor must he be the clerk of the peace of the borough, or his partner, nor employed in the affairs of the town. Two persons, directly or indirectly engaged in the prosecution of any officer committed for trial by the justices to whom he is clerk, are immediately on the appointment of a recorder of the borough by the crown, as above described, the borough council are to appoint a clerk of the peace, to hold office during good behaviour.

Sheriffs.—In the twenty-one cities and boroughs of England, with a county within reach, two sherrifs are chosen yearly, whose office is strictly analogous to that of the sheriff of an ordinary shire, but whose appointment is never, like that of the latter, made by the crown, but by election on the part of the whole corporate body, or some class of that body. They are chosen by the livemans from two lists, consisting of the alderman and the mayor's nominees; besides which any elector may name a candidate. At Carmarthen and Poole they were chosen by the freemen from among themselves; at Knaresborough and Beverley, from among themselves; at Canterbury, by the mayor and aldermen from the citizens; at Haverfordwest, by the freemen from the nomination of the common council; in Hull, by the freemen from two persons nominated by the common council, on the nomination of the mayor; and in Newcastle upon Tyne, by the mayor, and in Lincoln, one by the common council, the other by the mayor elect, both from the freemen who had served the office of chamberlain.

The city and borough sheriffs have often had the care of the gaol and the custody of the prisoners confined there. Their emoluments have been the ordinary ones attached to the same offices in counties; besides which, in some towns they have received yearly salaries. They usually performed the duties by deputy.

The office of sherriff in corporate counties remains elective as before, with the same powers and duties. The Municipal Reform Act of 1835 simply provides that the election shall in all cases be made by the council, on the 1st of November in every year; the sheriff elected according to former custom remaining in office until the first election under this Act, and no longer.

Bailiffs, &c.—'In those boroughs in which bailiffs were found among the principal officers belonging to the body of the corporation, they performed the duties of sheriffs. They seem to have been originally receivers and managers for the crown, or other lord of the borough, and not to have had any duties in connexion with the corporate body, until after the property of the soil became vested in the corporation, when the bailiffs also became corporate officers.' They
often had the custody of the gaol. In many places the office had become entirely nominal; in others its original duties had been partially revived; in still others it was sometimes filled by one person, often by two; at Berwick it was vested jointly in five, by three of whom bailable process must be signed. Their remuneration arose from the same sources as those of the sheriffs; in some towns they received an additional sum, actually or potentially commensurate with the profits of part of the corporate property.

Criminal Courts.—A court of criminal judicature has been held until the present time in most of the boroughs of England and Wales, though in some this branch of jurisdiction has long been suspended, and in others it has been partially, but partially exercised, all serious cases being sent by many to the county sessions or assizes. Some of those which formerly exercised jurisdiction over capital offences had since abandoned it: others, as Salisbury, Southampton, and Chichester, still tried capital offences; but where capital punishment was expected to follow conviction, an arrangement was made to prevent a trial before the corporate authorities solely. Several corporations, as those of Berwick, Bristol, Canterbury, Exeter, and Rochester, still exercised their chartered power of trying and executing for capital offences. In a few instances the criminal jurisdiction included that of a court of admiralty; at Bristol, for example, felonies committed on a part of the Bristol channel were triable at the ordinary court of gaol delivery, not as at a court of admiralty, but as in the constable's petty sessions. At Marlborough, where the justices were nominated by the mayor, felonies were tried until 1824, when it was discovered that the corporation possessed no such jurisdiction.

The ordinary criminal courts were those of general sessions and quarter-sessions. Courts of general gaol delivery existed in very few places: in some of these they were held under charter without any commission issuing from the crown, while in London, Oxford, and some other places, they were never held without such a commission. When a commission issued, the corporate magistrates were the sole judges; the time of holding these courts was sometimes discretionary with the corporate magistrates, sometimes regulated by the charter, as at Exeter, where they must be held four times a year, and in practice have been opened at the feast of St. Thomas the Martyr. The general sessions, too, the ordinary criminal court of the cities and boroughs, seldom differed, as to the time and manner of holding them, from the county quarter-sessions. In all the corporate courts one or more magistrates were specially named, who, unless those in whose presence the court could not be held, usually it was the mayor or the recorder, sometimes both. In some cases where the presence of the recorder was not necessary for holding the court, he did not attend, but in many the whole business was conducted before him. At Bristol he tried a case in which the gaol delivered the prisoners over to the quarter-sessions, the prisoners at the latter being tried before the mayor and aldermen, but virtually by the town-clerk, who there was necessary a barrister. The jurors were generally summoned from the inhabitants at large, without strict reference to any qualification; sometimes from the freemen alone. In the latter case, the number out of whom they were chosen was often inconveniently small.

In many boroughs no fund was provided for paying the expenses of prosecutions; in some they were paid from the county-rate; in others from a borough-rate in the nature of a county-rate; in others from the poor-rate. In many of the principal towns, as Liverpool, Leeds, Bristol, Hull, York, Newcastle, Berwick, the criminal courts were attended by barristers; but in most of the smaller places the business was conducted solely by attorneys.

Civil Courts.—A great majority of the English and Welsh municipalities possessed also a civil jurisdiction co-extensive with the borough limits. These in general had their own charter or chart, and were generally dispensed with by prescription. They varied considerably as to the nature of the actions they might entertain. In general they had cognizance of all personal actions; and in some instances of actions real, personal, and mixed. The amount for which suits were maintainable was generally limited to the power of removal), while in several cases it was restricted to the recovery of debts under a given amount. The presiding judge in these courts was generally the mayor, whose they were not unfrequently termed the mayor's court. Sometimes the bailiffs presided with the mayor; in other instances the recorder, and occasionally the mayor and recorder. In several cases the recorder, though a magistrate of the borough, was not a judge of the court of record; in many the town-clerk practically officiated as such. The officers of these courts were generally the town-clerk and the bailiffs or sergeants-at-mace. None of these offices was hereditary; those belonging to the office of sheriff; he issued writs, filed and enrolled the proceedings, granted rules, taxed the costs, and signed the judgments. The bailiffs or sergeants-at-mace performed the duties which, in actions brought in the superior courts of common law, were devolved upon the sheriffs of counties. To them writs were directed; by them they were served and returned, and generally they were answerable, like sheriffs of counties, for any irregularity in the service. It must be understood, however, that the character of the charge imposed by the charter on the officers of the boroughs; but in every court there was, under some name, a functionary performing these duties.

The borough courts of record, in their general constitution, resembled the superior courts of common law. Where created by charter, the proceedings were according to the practice of some one of the courts at Westminster. Being however seldom regulated by any printed or written rules, their practice was very ill defined, though in some few instances rules have been prepared and published, after approval, by the corporation, but these rules have not as yet been commenced, in case of serviceable process, by summons, and of bailable process, by capias. As regards the times of the returning of process, and consequently the period of obtaining judgment, the practice has been various. In many instances the natural time fixed by the charter, or the other steps in the cause were taken, weekly; in others, only every fortnight or three weeks. In contested cases, judgment could be obtained in few under six weeks; in general the period was longer. In some boroughs, as Chichester, the suitant and defendant might, after a certain period of pleading pronounced by the courts of common law. In some the process was by distraints, or distress of the defendant's goods, and renditiones exponas, or exposure to sale, in cases where the debt exceeded 40s. This was generally found on affidavit of the debt; but at Berwick it issued without affidavit when the demand was under 15s., and at Lancaster when it was under 40s. At Preston, burgesses were exempt from this process. Several courts, as in London, Bristol, and Exeter, have had the custom of foreign attachment, by which a plaintiff may distrain the goods of his debtor, the latter being held in a third party with the borough, and in default of appearance, cause them to be applied in satisfaction of his debt. In Lancaster, only the goods of non-freemen could be thus attached. This custom, where existing, has extensively extended since 1688.

Defects of the Judicial Organization in general.—The corporate magistrates were often selected from a class incompetent to the discharge of judicial functions. The magistrates of one borough (Malmesbury) were often unable either to write or read; and at another, having extensive and exclusive jurisdiction, they have known to be blank warrants. Even where they have belonged to a superior class, they were often selected from the senior aldermen only, who, from age and infirmity, soon became incapable of performing the duties of their office, while a mistaken notion of dignity kept them from asking to be relieved. All these defects, and others, are so gross defects in other parts of the judicial system. The juries of the borough courts were often taken exclusively from the freemen, who, besides being of an inferior class, were strongly tainted with party-feelings. At Carmarthen, for instance, the commissioners showed that 23 juries were frequently given against justice, from party bias; and at Haverfordwest, where juries could only be impannelled from the freemen, they had been openly reprimanded by judges and magistrates for improper acquittals of Burgess's case. The general opinion was that it was "impossible to convict a burgess." Closely similar were the defects in the administration of civil justice. The vicious consequences of the union of incompatible functions in the persons of the town-clerk and the mayor, as well as the necessity of their being selected from the same objectionable class as in the criminal courts; at Portsmouth they were selected by one of the sergeants-at-mace, chosen out of two by the plaintiff's attorney; at Chichester they were summoned by an officer who was
one of the four nominal attorneys in court, the real attorney in the cause having the power of selecting the nominal attorney. The serjeants-at-mace and other ministerial officers of the court, exercising the functions of sheriff, were often called serjeants-at-law and had a summary responsibility to afford any security to the court to be given. The costs of a suit were in general very considerable: those of a plaintiff often varying from 15l. to 20l., of a defendant from 8l. to 12l.

The whole system of costs and fees was objectionable; there was generally no authorized table of them, and frequently no well-defined practice; they were most commonly in the town-clerk's discretion, though in some places taxed by the mayor; they bore little relation to the services in respect of which they were paid, and no reasonable proportion to the average value of the cases in question. One cause among others which led to the disuse of these courts was the want of professional skill in the judges. Nor can we doubt that the intimacy which must often have necessarily subsisted between the judge and the parties appearing before him, was one source of the frequent procrastination to which these tribunals, at which a few minutes would convert the tradesman and the customer into the judge and the suitor. Another reason was, the facility of removing the causes, and the general inclination of legal practitioners to sue in the superior courts. When a plaintiff had procured execution, he could use it only within the limits of the local jurisdiction; hence his process was often fruitless, the defendant removing himself and his goods beyond the limits of the court. The unlimited power of imprisonment possessed by these courts, and the frequent suspension of the proceedings of the inferior courts, were also mischievous.

One general observation remains to be made on the judicial powers lately exercised by the municipal corporations of England and Wales. Their extent was wholly disproportionate to the importance of the town or the probable results of any action: for instance, with a population exceeding 50,000, no felonies could be tried, but all must be sent to a distance varying from eighteen to fifty miles; while in Winchester, with a population of only 1,728, and in Dunwich, with only 232, the same courts have the power of trying all felonies. The decision of concurrent or exclusive authority more correspondent to the relative importance of the respective places, or to the principles of expediency arising out of their situation and their means of communicating with the seat of county jurisdiction, is a grant of exclusive power seems either to have depended entirely on accident or caprice, or to have been determined by circumstances which have long ceased. Many corporations have disused the jurisdiction conferred by charter; generally from unwillingness in the corporate magistracy to undertake the responsible exercise of power. On the other hand, many of the evils above enumerated in the administration of criminal and civil justice have resulted from the continuance of jurisdiction after the decay of the borough. In many instances the limits are extended to an extraordinary degree by the practice of finding competent persons to act as magistrates, even in petty sessions, although a sufficient number might be found capable of superintending the police, and the paving, lighting, &c. of the town. Even if this were not in the interest of the corporation, the violence committed by outlaws, great injustice resided from intruding the powers of sitting as magistrates in quarter-sessions, and as judges of civil procedure, to persons without professional knowledge and experience.

Notwithstanding all the defects of the local civil courts, the inhabitants bear marked testimony to the general desire of the inhabitants for their continuance or revival. Any system, say they, which would have the effect of distributing justice where the parties interested reside, would be regarded as one of the greatest boons which the legislature could confer.

Borough Courts under the Reform Act of 1835.

Criminal Courts.—After the 1st of May, 1835, all criminal business in boroughs is henceforward granted to any corporate or chartered officer or justice in any borough, and all right to elect or nominate any justice of the peace for the borough, or to act as such, other than as is provided in this act, are to cease. But any court now held hereafter in any borough under the authority of the 1st of May, 1835. On the passing of this act, all claims whatsoever by boroughs, or their freemen or inhabitants, of exemption from the jurisdiction of the Court of Admiralty, or of possession of any such local admiralty jurisdiction, however granted, are repealed—except the jurisdiction and office of the lord warden as admiral of the Cinque Ports.

Once in every quarter of a year, or oftener, at his discretion, or at his majesty's direction, the recorder is to hold a court of quarter-sessions for the borough, of which he is to sit as sole judge. It is the business of the court of record, and have cognizance of all crimes, offences, and matters cognizable by any county court of quarter-sessions, the powers of which the recorder is to possess. But he is not to make or levy any county rate or similar rate, or to grant tavern licences, or exercise any of the powers specifically vested in the county courts. In the absence of the recorder and deputy recorder, the mayor is to open and adjourn the court of quarter-sessions, at the proper times, and to require recognizances until a further day, to be proclaimed by him; but the mayor is to have no power to act as judge, or to do anything more therein than is above stated.

After the 1st of May, 1836, every person then committed for trial at any borough court, charged with any offence which the recorder has jurisdiction to try, may be removed to the prison of the county, to take his trial at the next sessions or assizes.

Also, after the 1st of May, 1836, the justices of the county in which any borough, not having received the grant of a separate court of quarter-sessions, is situated, are to exercise full jurisdiction within such borough. But no part of any borough that shall have a separate court of quarter-sessions is to be within the jurisdiction of the justices of any county from which the borough was exempt before the passing of this act.

Every county gaol, house of correction, or lunatic asylum, court of justice, or judge's lodging, which at the time of the passing of this act was for any purpose taken to be within a county, is, for all such purposes, still to be so taken, although included within the limits of a county rate vested in the county council. Civil Courts.—In every borough in which, by charter or custom, there is or ought to be held a court of record for the trial of civil actions, not regulated by any local act, or in which, at the time of the passing of this act, a barrister of five years' standing shall act as judge of the court of record, or in his absence, or if there be not one, such officer of the borough as, by charter or custom, is the judge of the court, is to continue and act as such. The council, in every case, is to have the power of appointing the necessary officer, if he be not the recorder; and every such judge or officer, except he be the mayor, is to hold his office during good behaviour. And he is to hold his court at such times and places, and with such rules of practice, and with the same powers and jurisdiction, as before the passing of this act.

The authority of any such court, in which a barrister of five years' standing shall act as judge or assessor, is to be extended (if it have not already such authority) to the trial of the actions of tenement, covenant, debt by specialty or on simple contract, trespass on the goods of another, and the like, where the damage shall not exceed £10, and of ejectment between landlord and tenant where the annual rent shall not exceed £10, without any fine. And any such court may make rules, from time to time, for regulating the practice of his court, which rules are not to be in force till allowed and confirmed by three or more judges of the superior courts of common law at Westminster. The jurisdiction of such court is to extend to the bounds of the borough, but no such judge, wherein the title to land or any other tenure, or to tithe, toll, market, fair, or other franchise, shall be in question, in any court which, before the passing of this act, had not authority to try actions respecting such titles.

Borough council courts.—Every borough having a separate court of quarter-sessions, or of record to be held, is to appoint a registrar, where the town-clerk acts as registrar, and other officers and servants to carry on the business and execute the process of the court.

Criminal Courts.—Every borough, having a separate court of quarter-sessions or of record to be held, is to be qualified and liable to serve on grand juries, and on juries for the trial of issues in such court (unless exempt or disqualified, otherwise than in respect of property, under the Act of Geo. IV. c. 50), to serve on petty sessions in any borough, not oftener than once in one year. The burgesses of every borough having a separate court of quarter-sessions are to be exempt from serving on juries at any sessions for the county. After the passing of this act, no person in any
Borough is to continue exempt from serving on juries by virtue of any grant, charter, or other special exemption; and so much of the Act of Geo. IV. cap. 50 as continues such exemption is repealed.

Fees.—The council of every borough shall have a separate court of quarter-sessions, and a commission of the peace; or a court of record, to be made and sit, within six months after their election, a table of fees to be taken by the clerk of the peace, the clerk to the justices, and the registrar and officers of the court of record; and such tables are to be submitted to one of the secretaries of state and confirmed with or without alterations, as he shall think proper. The council may from time to time make new tables to be confirmed, as above directed.

Penalties and Proceedings.—Any penalties recoverable in any quarter-sessions or by any act made payable to the king, to a body corporate, or to any person whatever, except it be the informer or some party aggrieved, are, if recovered before any justice of a borough having a separate court of quarter-sessions, to be adjudged to be paid to the treasurer on account of the borough fund, and no one else; except being made all of penalties or forfeitures recovered under any act relating to the customs, excise, or post-office, to trade or navigation, or to any branch of the king's revenue. The prosecution for any offence punishable on summary conviction may be commenced within three months after its commission.

The justices before whom any person shall be summarily convicted are to cause the conviction, under their hands, to be drawn up according to a form prescribed by the court which may name the date and place of the conviction, the name of the offender, with the time, place, and nature of the offence, the amount of the penalty, and the time fixed for its payment to the treasurer of the borough. It is expressly enacted that all officers who shall either grant any bye-law or regulation made by virtue of this act, are to be punishable on summary conviction in like manner. Provision is made for appeal from such conviction to the next court of general or quarter-sessions, held after twelve days, and for the offender's liberation in the interim, on entering into a recognizance with a sufficient surety to appear personally at the sessions. But no conviction, order, warrant, or other proceeding by virtue of this act is to be quashed through the irregularity, nor removed into any of the courts at Westminster.

Gait.—In nearly all the boroughs having criminal jurisdiction are gaols which have been under the superintendence of the corporation or the municipal magistrates. The gaols are from time to time repaired, in part by corporation funds; in others, from a borough-rate; in others, from the poor-rate. In many boroughs the same gaol was used indiscriminately for criminals and for prisoners committed by the civil court. In some few poor debtors, who were not confined for a small debt, were committed to the corporation. In those where the municipal magistrates committed to the county gaol, the borough gaols were used only for temporary detention. Sometimes prisoners were committed at once to the county gaol until trial, brought back for trial in the borough sessions, and again sent again to the county gaol to undergo their punishment. But debtors taken under process from the civil court must remain in the borough gaol.

Defects.—The state of the borough gaols is far from favourable. We are not aware of a single case of the evils of continuing the late constitution of the local tribunals. They have rarely admitted of any proper classification of the prisoners. In some large towns, as Berwick, Southampton, and Southwark, they were found in a very discreditible condition: in many of the smaller ones, they were 'totally unfit for the confinement of human beings,' often without sufficient air and light, frequently mere dungeons under the town-hall. In such receptacles it was impossible to set a prisoner to work, and for the reception of criminals from the courts. Felons might often be committed to the county gaol, while the borough gaol was in an unfit state; but as this power did not extend to prisoners committed from the civil court, debtors might be lodged in places of confinement thought unfit for the reception of criminals from the courts. Consequently, to the commissioners that the gaol of the borough was so notoriously improper a state for receiving prisoners, that plaintiffs were unwilling to consign to it defendants against whom they had obtained execution. At one place the same feeling was said to prevent the prosecution of criminals. Where the corporate bodies have had the means of improving the state of the gaols, their neglect, as the commissioners remark, admits of no palliation; but many, they state, were unable to defray the expense of more suitable arrangements. The rents from all the old borough rights, by birth, marriage, and apprenticeship, present or future, are reserved for the use of all persons having any share in them at the dissolution of the old corporations, in so far as regards their claim, by charter, law, or custom, to a portion in the real and personal estate, the rents and profits of any borough, or in any charter.
ritable trusts, the benefit of which latter was in many instances exclusively appropriated to the freemen, their widows, or children. But, before the proceeds of any such property are so divided, it is directed that the interest of all lawful debts chargeable upon it, the salaries of municipal officers, and all expenses of the town that on the 5th June, 1833, were defrayed out of it, shall be discharged. In like manner every person possessing, on the 5th June, 1835, any such active or inchoate title to freedom, is to have the same exemption as formerly from any borough tolls or dues, provided that he pays any sum of money, which, in consideration of his freedom or of any such right, he would, on the old system, have been liable to pay, and fulfils every other condition heretofore required, as far as is consistent with the provisions of this act. But all other exemptions from municipal tolls or dues, or all the pluriannual rights of trading which existed in many boroughs, are at once abolished.

The reservation of the freemen's title to the parliamentary franchise, included in the Parliamentary Reform Act of 1832, is distinctly maintained in the Municipal Regulation Act.

In anticipation that the several provisions of this act could not be carried into effect in the first year (1835), within the periods fixed in the act itself for that and all succeeding years, one of its clauses empowered the king in council to appoint, for the first year only, any other days before the 1st of May for the several elections to which the provisions of the several stages in the introduction of the new system; accordingly, the times for the several proceedings in question, as regards the first year only, have, by Order in council, been extended for about two months respectively. The following table will be found useful as excluding all old, clear, compact, and chronological view, each separate stage of the proceedings under the new system, with the precise date for each of the first year, in comparison with that fixed by the act for all following years.

As regards the ceasing of the old offices and the commencement of the new, it is directed that, after the first election of councillors under this act, the mayor, aldermen, and all other members of the old governing body of the borough, as named in the schedules to the act, by whatever style they may be designated, are to go out of office, and their whole powers and duties are to cease; but any of them may be elected according to the new regulations. Every person holding, on the day of the passing of this act, any office, a new election to which would by that act be introduced, if a charter, or custom, have taken place between that day and the 1st of May, 1836, is to continue to hold such office, with all its duties and emoluments, until the time provided by this Act for his going out of office. 'Every bailiff, treas-
old municipal order to the new, it is not for us to estimate with what degree of uniformity or rapidity that local and general good shall result which we so confidently anticipate. In the words of the recent writer, that as, in former days, municipal corruption was found to be the grand inlet to parliamentary subserviency, so municipal regeneration, by promoting civic virtue, activity, and intelligence, among the inhabitants of towns, thus brought to exercise a free voice, and a vigilant eye, was the surest instrument of public safety and government, will eventually accelerate the thorough infusion into the representative house itself, of that steadily popular and independent spirit which alone can give the highest usefulness and stability to the government of a great empire in its various departments. We then find various places denominated burghs or boroughs, and some with that term as a component part of their name, as Edinburgh, Roxburgh, Jedburgh, Musselburgh. The towns now mentioned will also illustrate the condition of the Scottish boroughs, some being the property of the sovereign, as Musselburgh the property of a subject. Musselburgh belonged to the church, and from the territory on which it stood being erected first into a barony, and afterwards into a regality with exclusive jurisdiction, it was successively a burgh of barony, a city, and a county. In some particular villages, more villages, but some, like Berwick, were raised from that and higher conditions to be burghs of the king in demesne. The burghs were at this time the property of the sovereign or other lord, and disposed of accordingly. Thus in the munificence of King David to the soul of a man, strange things of Scotland, Renfrew was included. So the burgh of Dundee was bestowed by William the Lyon on his brother David Earl of Huntingdon, who also received a grant of Inverbervie from the same monarch, as Cospatrick Earl of Northumbria, and James, King of Scotland, in terms of the latter of Colom IV. In like manner King Malcolm IV. bestowed on the steward of Scotland, by grant, a portion of land in every royal burgh in the kingdom as a place of residence; and we find that the constable of Scotland had likewise, of right, a tenement burgage in each of the royal burghs, derived no doubt in a similar way.

The following series of the royal boroughs of Scotland has been made by Chalmers (Caledonia, vol. i. p. 775), as they successively appeared to him in charters. Under A.D. 1111, we have King David’s charter to Berwick, Inverkeithing, Perth, and Aberdeen; the three last of which obtained their respective charters from King William the Lion. Under David I., Jedburgh, Haddington, Linlithgow, Rutherglen, Renfrew, St. Andrews, Dunfermline, Caithness, Fife, and five burghs of Carlisle, Granton, Leith, St. Andrews, and Berwick. Under David II., many charters to burghs, Dumfries, Lanark, Glasgow, Irvine, Ayre, Forfar, Dundee, Arbroath, Montrose, Inverurie, Kintore, Banff, Cullen, and Nairn. Under Alexander II., Annan, Dumarton, Dingwall, and Rosemarkie. Under John, we find charters to such burghs as Dunbarton, Righdon, Urquhart, Robert I., Kirkcaldy, Queensferry, and Lochmaben. Under David II., Cumbernauld, Inverurie, Dunbar, Brechin, Lauderdale, and Wigtown. Under Robert III., North Berwick and Rothesay. Under James I., Kirkcudbright. Under James II., Lanark, Ayr, and Dunbar. Under James III., Tain, Cremarty, and Kinlochbervie. Under William III., Cardross, and Ardros, though the charters here mentioned, and to which reference has been made, ever must not be taken as perfectly accurate, and indeed Chalmers himself furnishes materials for its correction. Thus Lanark is placed under the reign of William the Lyon, but in the third volume of the Caledonia we find the author saying, ‘it was certainly a royal town as early, at least, as the reign of Malcolm IV., who in granting a toft in Lanark, says it is in burgo me.’ (Caledonia, vol. iii. p. 607.) On the other hand, he tells us (vol. ii. p. 658) that Queensferry, though long ago, and not a borough so late as 1536. The most antient existing charters to the boroughs of Scotland are, for the most part, grants or confirmations of particular privileges to the burgeses, and do not, any more than the early charters to the towns of England, explain the meaning of this most artificial stage in the progress of the burghs had been already passed, namely, that of their erection into bodies corporate, if indeed the mere association of the inhabitants had not in those days this effect. Nay, the charter on which the burgh of Montrose is founded is not of a local but of a personal andambulatory nature. It is by King Malcolm IV., 'to the burgesses of the Bishop of St. Andrews,' and confirms to them all the liberties and customs which the king's own burgesses have, 'pertinent to their mean, or quay.' (Connet on the Election Law, p. 470.) The charters are however generally of one description, and convey to the burg and burgesses, or to the burgesses of the burgh, the privileges mentioned in the royal charter. There were probably for punishment or for trade free of toll or tributes, that they shall not be disbarred but for their own debts, and that they shall have a certain market. Other privileges are sometimes conferred, such as the right of a merchant guild. These privileges were not confined to the royal burghs; similar concessions were granted by the sovereign to the burghs of subjects; and in their turn imitated the royal example, and, like the monastery of Dunfermline, to our burgesses of Dunfermline and their heirs for ever,' confirmed or bestowed various privileges, until the time of the Reformation. The antient foundation of burgess-ship appears to have been possession of a tenement of land within burgh. An exception was early made in favour of a son not yet foris-familiae, and this was subsequently extended in various directions. And for a time, when a burg commune was not in a person that thus became a burgess avowedly to the king and his bailies and the community of the burgh, and became bound to pay to the king a certain annual sum for, and to watch and ward his land. The borough mailles was a duty to pay an annual rent or revenue, and it was the duty of the great chamberlains of the kingdom to take account of their payment. The other principal source of the royal revenue from the burghs were the customs, great and small; and every town, at least those indifferently of the number of King John's burgesses, was granted certain customs and paid them over to the chamberlain, under deduction of course not only of accustomed charges, but also of sums directed by royal precept to be paid out of the customs or firms of the borough. About the beginning of the fourteenth century the kings of Scotland adopted the method which had been followed in England, of granting feus or perpetual leases of the boroughs and of the petty customs to the communities of these boroughs, in return for which they stipulated a fixed annual redemption of money, together with a rent varying in proportion to the size of the boroughs granted to boroughs; which, instead of concessions of particular mercantile privileges, began then to take the form of regular feudal grants of the town in free-farm to the burgesses and community for a money redem. King Robert Bruce seems to have been the first of the Scottish monarchs who adopted this practice, and his example was followed not only by his royal successors, but also by the monasteries and lay nobles towards their burghs. On the accession of King James I., however, probably from an idea of the advantage which such grants would have in collecting the customs and rents of burgs, were prejudicial to the revenue, an act was passed annexing the customs and borough mailles to the town for the king's maintenance; and by a statute passed in 1597 all alienations, annuities, and purchases of the annexed property, as well as of the customs, made before lawful dissolution (disannexion) in parliament, were declared null. But neither of these statutes appear to have interfered with the method of granting royal charters to the boroughs, and it is certain that the monasteries continued to enjoyed the privilege of their charters; and in early times no difference seems to have existed between the privileges granted by the crown to the king's own burghs and those so granted to the burghs of subjects. Thus King David I. granted to the canons of Holyrood a charter in 1123, allowing them to sell their goods in their church and his house of Edinburgh, and the burgesses were enabled by him to buy and sell and traffic as freely and fully as his burgesses of Edinburgh. So Dun-
bor was made a royal borough by King Alexander I.;
yet the same king, twenty years afterwards, granted a
charter to the Bishop of Glasgow, allowing his burgesses
and their successors to hold borough courts for the
same purpose as they had done before Dunbarton was made a royal burg,
and without any hindrance from the bailies of Dunbarton. By various acts of the Scottish legislature also, mercantile
privileges were conferred on the free burgesses generally without
regard to the title of the county, or of the crown or
boroughs of barony or regality. However, by an
act of the first parliament of King Charles I., the privileges
of exporting merchandise, of using merchandise, and buy-
ing wine, wax, silk, and the like, and of packing and peli-
ing it, by importation of foreign goods and shipping the
burrowers royal that have vote in parliament and bear
burden with the rest of the burrowers, and to no others; and though
its extent has since that time varied at different times, an
exclusive monopoly is still enjoyed by the royal boroughs, and such
right as the state could annex to it is communicable to them. When we find that it was so
long before the monopoly of the royal boroughs showed itself,
it may be thought strange to say that monopoly is the spirit of the system, but circumstances can only be given for its late
appearance; it cannot appear till the influence of the church
and of the lay nobility in favour of their respective
burghs had fallen, and the influence of the crown pre-
availed. The Scottish burgh by its monopoly reigns undisputed among its own people and wherever its
constituents may be. Besides these, several minor associations
are to be found, consisting of
particular portions of the community asserting exclusive
privileges. Of these the most antient is the guild which
appears in Scotland to have always designated properly an
appropriate class. Other orders of burghs are the example of their merchant fellow-burghers, and formed
themselves into crafts, which, notwithstanding much oppo-
sition, at last obtained a legal establishment; they now exist in the towns of Scotland by royal charter, by seal of
councils, and by the practice adopted both on the continent
and in England of presenting them to some of the king’s great officers on
their obtaining the magistracy, seem to countenance the idea
that the royal burghs, of which there are a large number, and
elsewhere, is in Scotland, from the record of records, little
better than conjecture. As early as the ‘Legas Burgorum’
the magistrates were elected at the Michaelmas head court,
de consilio communi proborum hominum villae qui sunt
fidelis etque farmae, and in the borough of Aberdeen,
where we have the oldest borough records extant, they were
elected, prior to the year 1469, either by the whole burghers
or at least by the guildy. In the year now mentioned
however an important change in the whole system of
burghs is to be noticed. The Corporation of Edinburgh was
introduced which lasted nearly four centuries, and well
proved the ruin of the boroughs. By the act 1469, c. 30,
'Touching the election of officers in burrowers, as aldermen,
bailies, and other officers, because of great contention
yearly,' it is enacted, that 'no such officers shall be
named, but in their stead are to be named, through the
clamour of communes, simple persons;' it is thought
expedient that no officers may be named after the
king’s lawes of burrowers, further than one yea, and that
the chusing of new officers be in this wise: that is to say,
the usual council of the town shall choose the new council,
in sack number as accorded to the town; and the new

cel and the auld, in the yeir foresaid, sal chuse all officiers
pertaining to the toun, as alderman, bailies, deen of gild, and
other officiers. And that ilk craft sal chuse a person of
the same craft, that sal have voit in the said election of
officiers for the time, in likewise yeir by yeir.'

As in England, so in early times in Scotland, there were
certain borough courts at which all the burghers were re-
quired to attend; the most eminent of which were the three
bushsquare, where chiefly the cultural and municipal
affairs of the borough, where tenants owed suit to their
lords. Here, as we have seen, the burgesses elect their
courts, and the chief business of the borough was transacted. But
these borough courts soon fell into disuse: the attendance
and the solemn machinery were left to be performed into the hands of a few persons, and the magistrates alone
exercised burgal jurisdiction. This jurisdiction also became
your very ample, particularly in the royal burghs; in
personal actions it was unlimited, and in dispensation actions it
was of a very large: all such officers and imprison
debts fill they found bail; they had jurisdiction in
brieves, in sequestrations, and in the registration of
deeds; they acted also as commissioners of supply and as
justices of the peace; and their criminal jurisdiction
extended in scope, to say the lands and of this jurisdic-
tion the greater part still remains. For its due execution
most of the burghs have assessors, learned in the law;
and the deans of guild and his council acquired title of
the crown. The magistrates of several burghs were also, as in
England, erected into counties corporate, with a jurisdiction of sheriffship within
themselves; such are Edinburgh, Stirling, Linlithgow, Perth,
Inverness, and Forres.

The control of the magistrates, and generally of the whole
affairs of the burghs, particularly of the king’s burghs,
was vested in the great chamberlain of Scotland, a high
officer of the crown, who appears in the full exercise of
his powers before the reign of King David I. in the twelfth cen-
tury. This great officer had jurisdiction throughout the
kingdom, at which the magistrates and
burghers of the several burghs were bound to give
attendance, and where the chamberlain heard and determined
the various charges for breach of official or other duties
against the burghers, and took their sureties against the various classes of the inhabitants, such as
butchers, bakers, brewers, and the like. He also levied
the different revenues accruing to the crown from the burghs,
and investigated into the employment or disposal of the
common good, that is to say, the lands and revenues be-
longing to the community of the burghs. For about two
centuries and upwards the office of chamberlain was mostly
held by ecclesiastics; it afterwards came to be vested in the
nobility and higher gentry; and at length in the beginning
of the sixteenth century it was given as a reward to
the practice adopted both on the continent and in England
officers on their obtaining the magistracy, seem to countenance
the idea
that the royal burghs, of which there are a large number, and
elsewhere, is in Scotland, from the record of records, little
better than conjecture. As early as the ‘Legas Burgorum’
the magistrates were elected at the Michaelmas head court,
de consilio communi proborum hominum villae qui sunt
fidelis etque farmae, and in the borough of Aberdeen,
where we have the oldest borough records extant, they were
electected, prior to the year 1469, either by the whole burghers
or at least by the guildy. In the year now mentioned
however an important change in the whole system of
burghs is to be noticed. The Corporation of Edinburgh was
introduced which lasted nearly four centuries, and well
proved the ruin of the boroughs. By the act 1469, c. 30,
'Touching the election of officers in burrowers, as aldermen,

in sack number as accorded to the town; and the new

* This expression, atbara perhaps in its modern acceptation, ceased con-
siderable merrieret in the debates of the House of Commons on the Scottish
Reform Bill, by which the statute in the text was repealed. But we appro-
ved of it being taken as descriptive not of mental character but of
a civil condition; and was employed, as in numerous other instances in old-
other writers, to designate the commonly as distinguished from the gentry,
and so to be merely expositive of the preceding term in the set, 'communes.'
was chamberlain of Scotland, and just before his resignation of the office in favour of his eldest son, a court of the Four Bourgeois was held at Stirling, where it was resolved that two or three depots, for the deposit of the royal boroughs' money, of the Spey should convene yearly with the court of Four Bourgeois to consider and conclude on all matters affecting the common welfare of the royal boroughs, their liberties, and court. No explanation has hitherto, we believe, been given of the reasons why the boroughs were excluded from this assembly, any more than for the fact that boroughs so far south and so few in number, as Edinburgh, Stirling, Berwick, and Roxburgh, should have formed the court of Four Bourgeois, though it is known that the north of Scotland has been long been inhabited by a rude and industrious people. But the fact is, that the burgesses of the north were enjoying their own house. So early as the reign of William the Lyon a royal charter was granted to the king's burgesses of Aberdeen, and of Moray, and all beyond the Forth, whereby the burgesses were admitted, as fully and honourably as their predecessors had done in the time of the royal grantor's grandfather. (Kennedy's Annals of Aberdeen, vol. i. p. 8.) There appear to be no records extant of this northern convention; but there can be little doubt that it was held with the expression of a limitation, that the convention of boroughs south of the Spey was formed. This latter assembly, though it was appointed to meet in the same place with the court of Four Bourgeois, formed no constituent part of that court, and soon afterwards it had ceased as a separate occurrence. In 1487, when probably the superior advantages of one general mercantile convention was perceived, deputies from all the boroughs 'bath suth and north' were invited to meet and, on the day named in the act, the value of the boroughs of Inverkeithing, to confer and treat upon the welfare of trade, the gude rule and statutes for the common profit of burrowes, and to provide for remeit upon the skait and injuries sustained within the burrowes. It was then that the chamberlain's ayres were substantially superseded, and a foundation laid for the entire abolition of the office of lord chamberlain, whose place in the convention is now occupied by the lord provost of Edinburgh, who, though not a member of the convention, has the same powers and duties in that capacity. The attendance of a burgess on the convention is not to be met with in the books of the Scottish lawyers: but it appears to be this. The convention did not continue long to assemble at the ancient yet little borough of Inverkeithing, but like the other supreme courts of Scotland it was closed, not by the death of its president, but by the decay of the boroughs. The convention of Alexander Lord Home, who was appointed great chamberlain almost immediately after the passing of the above act of 1487; and that as person was at one time both lord provost of Edinburgh and lord chamberlain of the kingdom, and held both offices at the last time the latter exercised its duties in person, hence no doubt arose the practice of the lord provost of Edinburgh being the permanent preses, and the town-clerk of Edinburgh the perpetual clerk of the convention. This civic parliament has continued to hold its sitting annually at Edinburgh on the second Tuesday of July.

The precise time at which the royal burghs first sent representatives to the general parliament of the kingdom is uncertain. In the year 1326, when the tenth penny of all the revenue of the land was assessed, the burghs appear as a constituent part of parliament; but perhaps they did not continue permanently to do so till some time afterwards. After their admission the parliament comprises the bishops, the barons, and the representatives of the boroughs, in which ayres, as well as the last time of the exercise of its duties in person, hence no doubt arose the practice of the lord provost of Edinburgh being the permanent preses, and the town-clerk of Edinburgh the perpetual clerk of the convention. This civic parliament has continued to hold its sitting annually at Edinburgh on the second Tuesday of July.

This civic parliament has continued to hold its sitting annually at Edinburgh on the second Tuesday of July.
however, states that he cannot learn that this right was exercised in England, although it certainly was in Scotland, until abolished by Malcolm III, and in some parts of France; and even if it were, the reason, as it regards the youngest son only, is obviously absurd. Perhaps (the adds) a more rational account than either may be fetched (though at a sufficient distance) from the practice of the Tartars; among whom, according to Father Duhalde, this custom of descent to the youngest son also prevails. That nation is composed totally of shepherds and herdsmen, and the elder sons, as soon as they are capable of leading a pastoral life, migrate from their fathers with a certain allotment of cattle, and go to seek a new habitation. The youngest son, therefore, who continues latest with the father, is naturally the heir of his house, the rest being already provided for. So that possibly this custom, wherever it prevails, may be the remnant of that pastoral state of our British and German ancestors which Caesar and Tacitus describe. But it is unnecessary to go so far for the origin of a custom which the name itself and other circumstances show to be of English origin.

BOROUGH-Bridge, a m. t., bor., and t., in the par. of Aldborough, in the W. Riding of Yorkshire, and in the lower division of the wap. of Claro. It is situated on the S. bank of the Ure, over which there is a stone bridge. Pop. 596. It is about 205 m. by W. from London, being about half way between the metropolis and Edinburgh. It sent two members to parliament from 1553 to the time of the Reform Act, when it was disfranchised. Boroughbridge arose out of the remains of Aldborough, the antient Iseru or Isiru, derived, according to Hutton, from Is, or Isbar, a deity worshipped here, and Ure or Ure, the river on which the city stood. In accounting for the decay of Isirium (Aldborough) and the rise of Boroughbridge, Hutton remarks, the first depression Isirium felt was the removal of the royal residence from this city to York, in the days of Severus. The second calamity was the Danes burning the city to ashes in the eighth century; and the third, which completed her destruction, was turning the great north road, which ran through the centre, by removing the bridge. This made Boroughbridge superior to Isirium, and left Isirium desolate. (Hutton's Trip to Cootham.)

This town was granted, together with Aldborough and Knaresborough Castle, to Hubert de Burgh in the fifteenth of Henry III; but it was forfeited by his son for aiding Simon de Montfort at the battle of Evesham. Edward II. afterwards gave it to his favourite, Piers Gaveston. In 1321 a sanguinary battle was fought here between Edward II. and the discontented barons, headed by Thomas Earl of Lancaster, who was afterwards beheaded at Pontefract. Till recently the manor was in the possession of the Duke of Newcastle, by whose ancestors it was purchased in 1701. The town and par. abound with antiquities, which are continually being turned up by the plough. In 1831 a beautiful tesselated pavement was discovered, which is the best in the place, if not superior to any in the kingdom.

The most curious remains are perhaps the Arrows, which are at a short distance on the W. side of the town. The following sketch, with slight additions, is from Hutton, and will explain the situation of some of these interesting objects.

Many of the inh. have British and Roman antiquities to show and for sale;—small heads of brass, chains of gold, signet stones, urns, lamps, tiles, and coins. Some coins have been found of gold, and some of silver; but the greater number are of brass, and include those of the Emperor Augustus, C. Iulius, and the Roman emperors. Augustus, Iulius, Cae- sars, Trajan, Nerva, Trajan, Hadrian, Antoninus, Septimius, Valerian, Aurelian, Diocletian, Constantine, Carus- sius, and Julian. The chief importance which Borough- bridge at present possesses is from its situation on the great north road, the antient Ermine Street. It was formerly noted for its traffic in hardwoods, but at present its principal business consists in the shipment of agricultural produce. The Ure is navigable as high as Ripon for small craft, and several warehouses connected with its commerce have been lately erected on the S. bank of the river. Boroughbridge is supplied with water from the river Ouse; with Leeds, Wakefield, and the manufacturing districts, by the Ure, the Ouse, and the Aire and Calder navigation.

The chapel of ease is a perpetual curacy in the patronage of the vicar of Aldborough, and in the diocese of Chester. There is a national school for 100 children, established in 1814; and an infant school of recent date. The Methodists have a place of worship here. The town also supports a small subscription-library and news-room. The houses are large and well built, and the market, with its stone column; the market is held on Saturday, and is chiefly for corn; several fairs are held in the course of the year; that in June was formerly of great importance for the sale of hardwoods, and lasted for a fortnight; it was attended by the farmers of the neighbourhood and other parts of the kingdom. It is still frequently dealt by dealers from Sheff- field, Wolverhampton, and Birmingham, and continues for several days; the other fairs are chiefly for cattle. (Com- munication from Yorkshire.)

BORROMEO, ST. CHARLES, son of Gilberto Borromeo, Count of Arona, Lord of Anghiari, &c., and Margherita de Medici, sister to Pope Pius IV., was born at Arona, in October, 1538. He studied at Pavia under the famous professor, and then returned to the service of his father. After his uncle Pius IV. called him to Rome, and made him a cardinal and archbishop of Milan, and gave him all his confidence. Borromeo established an academy in the Vatican for the promotion of learning, and he published its conferences under the title "Letters Vaticanise." He urged the Pope to hasten the termination of the Council of Trent; and upon its conclusion in 1563, he was commissioned to draw up an exposition of the doctrine of the Roman Catholic Church, as sanctioned by that council. This exposition is known to posterity as the "Institutio Christi et Mari". After the death of Pius IV., in 1665, Cardinal Borromeo went to his diocese, where he devoted himself entirely to his episcopal duties. He reformed his expensive style of living, and employed the greater part of his revenues in charitable purposes. He also endeavored to reform in the clergy, especially among the monastic orders. The monks called Umillati gave most scandal by their openly licentious conduct; and Borromeo having exerted himself to check their disorders, one of them made an attempt upon the life of the cardinal, by firing at him as he was praying in his chapel. The ball perforated his garments without hurting his person. The assassin, named Farina, was taken and executed, together with two of his superiors who had instigated the crime. Pope Pius V. suppressed the order, and applied their revenues to other purposes.

Cardinal Borromeo used to visit every part of his diocese, reforming abuses, examining the conduct of his clergy, and providing for the wants of the poor. He established colleges and schools, and asylums for destitute children. He held several provincial synods, the transactions of which are found in his "Acta Ecclesiae Mediolanensis," fol. 1599. When the plague broke out at Milan in 1576, he exerted himself, at the risk of his life, in assisting the sick, and relieving the wants of the population. He was in that calamitous time, accused by his enemies of having overstepped the limits of his authority; and he had several disputes with the Spanish governors of Lombardy on matters of jurisdiction. In some of these disputes Cardinal Borromeo published a book, in which he entered into the motives of his acts, and adduced arguments in favour of the opinions of his age, for we find that he believed in the existence of sorcery. His conduct, however, was exemplary; and he zeal for the flock committed to his care unremitting. He

![Image](Image1.png)

died the 3rd of November, 1594. His body, dressed in his pontifical robes, is to be seen in a sarophagus of natural crystal, in the subterranean chapel of the cathedral of Milan. Charles Borromeo was canonized by Pope Paul V. in 1610. He has left many theological and ascetic works, homilies, and sermons, of which a catalogue is given by Mazzuchelli. His letters, which are a complete history of his life, have been published in three volumes, and are a valuable source of information.

BORROMEO, FEDERICO, the son of Giulio Cesare Borromeo, uncle of St. Charles, and of Margherita Triulzi, was born at Milan, in 1564. He resided first at Bologna and then at Pavia, and afterwards went to Rome, where he entered as a religious in a society of his own creation, both a classical and oriental scholar; and was intimate at Rome with Baronio, Bellarmino, and the pious philanthropist Filippo Neri. In 1595 he was made Archbishop of Milan, where he soon after made his entrance in the midst of public rejoicings and solemnations. In the following year he adopted the mantle of his cousin and predecessor St. Charles, and enforced his regulations concerning discipline with great success. He was not to be moved by all the differences, however remote and obscure, in his diocese; and his indefatigable zeal for the good of his flock, his sincerity and enlightened piety, are attested by Ripamonti and other contemporary writers, and have been lately again eloquently eulogized by Manzoni, in his Promessi Spiri. He was the founder of the Ambrosian Library, and first undertook the first great and largest undertaking that typography had undertaken. He employed various learned men, who went about several parts of Europe and the East, for the purpose of collecting MSS. Olgiate was sent to Germany, Holland, and France; Ferrar to Spain, Salmazni to Greece, a Maronite priest, called a professor in the University of Louvain. After he had collected, Cardinal Borromeo established a printing press, annexed to the library; and appointed several learned professors to examine and make known to the world these literary treasures. He also established several academies, schools, and charitable foundations. By his philanthropic charity, and energy of mind, were exhibited especially on the occasion of the famine which afflicted Milan in 1627-8; and also during the great plague of 1636. He died the 22nd of September, 1631, universally regretted, and was buried in the church of San Satiro, the most ancient of the Faucini, of St. Charles. Mazzuchelli gives a list of his printed works. He left also a number of works in MS.

BORROMINI, FRANCIS. Such is the injurious cele-

brity which this architect's caprices have obtained for him, almost rendering his name a synonym with bad taste, that it secures him a place in every work of general biography. Even the very excess of his derision and his capricious extravagance render him a sort of landmark in the history of the art, for both his works and his example deteriorated it to a height of licence. The son to whose early life was born in the district of Como, in the year 1559, and at the early age of nine was sent by his father, who was an architect, to study sculpture at Milan. After passing seven years there, and having collected in his storehouse of his recollections, Carlo Maderno, was then employed in finishing St. Peter's. On the death of Maderno, in 1629, although Bernini was appointed to succeed him as architect to that building, Borromini continued under him as he had done under his predecessor; yet, instead of the connexion thus established leading to any friendship between them, it only occasioned extreme jealousy—at least on the part of Borromini, who could not brook the superiority conferred upon one who was his senior only by a few months. He therefore endeavoured to secure for himself the patronage and supplant his rival, by having a plan offered, and so far succeeded as to ingratiate himself with Urban VIII. Owing to the patronage of that pontiff, he was employed upon a variety of important works, most of which would have afforded ample scope for the display of architecture and ornament, but in which the artist was not permitted to act as his own master. When, therefore, the appointment to the College of Propaganda; the oratory of the fathers of the Church of the Pio Maggiore, and the church of the Pio Maggiore, and the College of Propaganda; the oratory of the Fathers of the Society of Jesus, which is perhaps one of the least faulty productions, after the church of St. Agnes, the façade of the Doric Palace, "a building," says Woolf, "monstrous in every sense, but all the same a wonder, is situated at the head of a range of similar windows loaded with enormous mouldings, and overcharged in all parts, produces an effect of great grandeur, as seen obliquely in the narrow Corso." However, his church of San Carlo alle Quattro Fontane is generally considered one of the most perfect buildings of the late Renaissance, perhaps on account of the waving lines and surfaces of its façade; but not that there is even stronger evidence of bad taste in other respects, and of a kind not easily to be described by words. Besides the above and a great many other works, he had his name associated with those of other architects, being sometimes stored, or more properly speaking, modernized, the nave of San Giovanni Laterano, which, capricious as the parts and decorations are, has nevertheless something grand and im-
posing in its general character. It is not unlikely that even the absurdities and extravagancies of this architect carried along with them their own antidote; and after the mere figure of Langeais, the bolder and larger, but beyond their very excess to lead to the rejection of such puerilities.

**BORROWDALE**, a valley in Cumberland, remarkable for beauty of scenery. Its lower boundary may be placed at the stream which forms the waterfall at Barrow, about 21 miles north of Keswick, and it extends to the head of the lake Ullswater being slightly to the W., to the N. skirt of Scawfell, the nucleus of the Cumbrian group of mountains. It is watered in its whole length by the river Grange, which takes its rise in two streams from Scawfell: one coming from Sprinkling Tarn and Grisedale Tarn, the other descending from Esk Hause (the *échec*, to use a provincial term, or depression between Scawfell and Bowfell), which, with the bluff face of rock called Great End, forms the true termination of the great valley of Borrowdale. At the head of Borrowdale stands the Pikes, which is 3160 ft. above the sea. These streams, after their junction, form a powerful mountain torrent, which traversing Derwentwater, takes the name of Derwent after it issues from that lake. The level ground of the valley hardly begins before their junction; from which to Grange Bridge is about 6 miles. The breadth of the gorge where Castle Crag juts out into the centre of the valley, there is only room for the bed of the river; and this is one of the most beautiful spots in England: higher up the valley expands, varying in width to almost half a mile. The ridge of Grasmoor, which in Borrowdale is called Langstrath, a wild upland valley about 4 m. long, and in some places about 4 m. broad, entirely devoted to pasture, and terminated by Borrowdale Pike. Borrowdale is a chapelry of the parish of Crosthwaite, and the living is a perpetual curacy in the gift of the vicar of that parish. The chapel, which was rebuilt and a little enlarged, about twelve years ago, is near Rosthwaite. It is divided into four hamlets, Grange, Rosthwaite, Seathwaite, and Stonethwaite. Borrowdale formerly belonged to the abbey of Furness.

The flat bottom of the valley contains about 2000 acres; there are about 600 acres of arable land, of which about 1300 are under barley and oats, which are the chief crops; hay meadows; but in the upper valley it frequently is not housed before September, the climate being wet and cold. The mountain sheep-walks form the chief dependence of the farmer. There is a good deal of coarse wood, but very little timber. The best wine is made from the crimson hazel of the valley, as its same or scassa, to form an article of some account to the small proprietors. A sheep-fair is held on the first Wednesday in September. There is slate of good quality in the hill side opposite Castle Crag, but it has not been worked for upwards of 20 years. Formerly a quarry was worked on the top of that eminence; it is now we believe discontinued. Traces of fortification attributed to the Romans were formerly visible on it; but the combined effects of quarrying and planting have rendered it difficult to find them, and perhaps they are entirely obliterated.

There is a tolerably good carriage-road from Grange Bridge to the farm of Seatholm, between four and five miles; from thence to Seathwaite it is hardly practicable except for carts. From thence there is a horse road over the High Street leading to Wasdale Head to Westmoreland and the west coast. This, though scarcely passable except by the country horses (for the ascent from Borrowdale is very steep, and the descent to Wasdale Head is as steep and considerably longer, comprising probably not less than 1250 feet of perpendicular descent) has been frequently traversed though it might be supposed, not only by tourists, but as the readiest means of communication between the central mountain district and the coast. Horses laden with heavy packs of wool, &c., traverse it; and the path is kept in some sort of repair by the parishes. Two roads diverge from this main line; one a mere horse-path, leading by Stonethwaite to Grasmere and onwards; the other, which is hardly surpassed in grandeur even by Sty Head to Langdale, and thence to Ambleside, or Coniston; the other, which is just practicable for light carts, from Seatoller to Buttermere. Both these routes are very beautiful. There is a small lake in the Borrowdale district, known as Grasmere. Borrowdale belongs to the central division of the Cumbrian slate formation, which contains the highest peaks and the most romantic scenery. The most remarkable objects in it, next to the wad mine, are the Bowder stone, an immense detached block of stone, estimated to contain 23,000 cubic feet, and a remarkable group of yew-trees (celebrated in verse by Wordsworth) between Seatolhar and the wad mine, on the W. side of the valley. The largest is said to be 21 ft. in girth, and is in perfect freshness and vigour; it is one of the most interesting vegetable productions which we have seen in England.

**BORROWSTOUNNESS.** [Linlithgowshire.]

**BORSOD, BORSCHOD, or BORSODSKA, a co. in the prov. of the Hithel Thesias, in the N. part of the kingdom of Hungary, is bounded by the following counties: on the N. by Gömör and Torna, on the E. by Abaujvar, Zemplin, and Szabolcs, and on the S. and W. by Heves and Szabolcs. Its area is 1385 sq. m. The mountains which traverse it in the W., are the last declivities of the Thaya, a range of hills of which the highest is the Besk, of which subsides in this county; the first separating into two branches at Hámor, and forming the celebrated valley of Dios Györna. Both branches also throw out a number of subsidiary ones into the N. and S. of the county. The north branch runs into the river Tarna, near the Ostr, of Verbo, and the Nykryuk near Vainy. The last branches of the Neitra range occupy a corner of Borsod between the Bodva and Sayö, and the mountains in the N.E. parts, likewise branches of that range, subsides into the plains between Hidas and Nemesi, and the Karapata. The S.E. districts are one continued and beautiful plain, irrigated by rivers in every quarter. The principal rivers in Borsod are the Sayö, which enters its N.W. border at Putnok, and winds in a S.E. direction to Onod, where it receives the Bodva. At the northern point of the Karapata, there having received the Greater Hernád. The Hernád skirts the county for a short distance in the E. The Bodva passes into it from Torna, and flows past Szendró and Edefény, and the Thesias touches its S.E. extremity. The soil is highly cultivated, being adapted for grain, the vine, and the rearing of cattle. The finest wheat in Hungary is raised in the neighbourhood of Miskolcz, and of this wheat as of rye, barley, oats, and buck-wheat, considerable quantities are exported. The other productions of Borsod are chiefly the growth of Miskolcz, St. Peter, Karaszn, and Harsházy. The other vegetable productions are fruit, including almonds and chestnuts, tobacco (particularly in the S. districts), hemp, flax, and timber in abundance from the mountainous parts. The extent of available soil is estimated at about 731,530 acres, about four-fifths of the whole surface of the country; and of these there are actually under the plough 307,800, converted into vineyards 40,000, and used as meadows 38,160. The remainder consists mostly of meadows, pasture land, and woodland. The hills and pasture grounds, support a great quantity of cattle, sheep, and swine; the woods abound in game, and the rivers in fish. A great number of horses are likewise bred in the county.

Borsod possesses considerable mineral resources; copper is raised at Rudo Bánys, and excellent iron, from which the best common and cast steel in all the kingdom is manufactured, near Úpomy, Tapolsan, and other places. A beautiful kind of marble is obtained from Felso-Jarkány; there is also slate, which is worked at Kajos; there is a smelting furnace at Visoly; and coals are dug at Sayö-Nemesi and Dios Györna. In every respect indeed Borsod has justly been designated Hungary in miniature.

The pop. is estimated at about 74,000, more than one-half of whom are Germans. The county contains 10 m. l., 167 vil., and 57 predia, or privileges.

Many of the Jews settled in it are farmers; but the enterprising German has contrived to monopolize the trade of this and several other provinces in Hungary, and he has no
rival in Miskoltz either for the splendour of his dwelling, the beauty of his vineyards, fields, and meadows, or the luxuriance of his fruit. But the beauty of the town is largely
means neglected (for in Miskoltz alone five different sects have
distinct schools), more than common deprivity is said to prevail among the people in general. Borsod pays 63,411 florins (about 6300l.) as its quota to the war depart-
ment, of which the chief towns are Mezi-Kereke (2500 inh.),
and Mezi-Koves (3600 inh.); —St. Peter, in the N.W., capital Sayo St. Peter, on the right bank of the Sayo, a town full of Jews, and noted for the excellent wine its environs produce; — and Szendró, in the N.E., of which the Bohemian poet the Bishop of Prague, Böhm, was a native.

BORTHWICK, DAVID, of Lochlhill, lord advocate of
Scotland in the reign of King James VI, afterwards King
James I, of England. The early history of this learned
person is involved in the obscurity which shrouds the rise
of some of the brightest names in the juridical and literary
annals of the country, no particulars being known of his
birth or early life. When he first appears in the records
he is designated 'Mr. David Borthwick of Audalston,' an
estate which he probably acquired by descent. Whether
the title of lord advocate was conferred upon him by
Royal licence or not is uncertain; in any case, the ecclesiastical character is uncertain: it frequently did so
at that time; and we know that nearly all the first advoca-
tes of the college of justice, of which he became one, were
more or less connected with the church. In the spring of
1581, Borthwick was appointed one of the judges of the
court of session, or college of justice, that court
made choice of nine advocates 'being persons of gude con-
science and understanding, to procure (i.e. practice in suits)
before thame in all actions and causes.' Borthwick was one of these judges in 1582 he was a member of the public
commission then appointed to treat with the com-
missioners of England on the affairs of the borders between
the two kingdoms. On the 6th May, 1562, he appears as
one of the prosecutors in the indictment against two indi-
guals, Ferguson and Wright, for hagsenmack and*
and the murder of Mr. John Borthwick of Restalrig. (Pitcairn's
Criminal Trials.) On the 6th June, 1564, he was of counsel for the
magistrates and town council of the city of Edinburgh
in the prosecution against them for liberating on bail a
prisoner committed on a charge of assault and murder (id. th.).
At times he was employed on several important occasions.
He seems to have been standing counsel for the
nobles families of Huntley and Bothwell (Act Parl. vol.
ii. p. 573), which had recently been united by the
intermarriage of Lady Margaret Gordon with John James
of Borthwick. On behalf of that nobleman took instru-
ments of Queen Mary's pardon and forgiveness of him
and his accomplices for her abduction to Dunbar, which her
Majesty pronounced in court on 12th May, 1567 (Act.
Sed. 10).

On the death of Spens of Condie, in 1573, Borthwick
was associated with his executors for the estate of the
admirable Crichton, and who had been connived to Spens
in the office of king's advocate, and also advanced to the seat
on the bench of the court of session vacant by Spens's
death; for it was then usual to make the king's advocate
(for that time be had two or one of them) a lord of session.
The like practice existed in the old parliaments of France, after which, indeed, the
court of session is said to have been at first modelled; and in
both cases, we apprehend, for the same reason, namely,
to attend to the crown's interest there; both courts at
that time deliberating (like the ecclesiastical tribunals
from whence they were derived) in secret with shut doors.
Accordingly, besides the king's advocate, other officers
of the crown had also seats on the bench, such as the treasurer
and the comptroller. These latter, being the latters of
the lord justiciar of Scotland, but for about a
century and a half he had acted also as public prosecutor
in the justiciar's court, and for the preceding fifty years
had devolved his duties at the table on a deputy. The king's
advocate however was now advancing on the clerk's usurped
province, and by the beginning of the following century
had brought his power into its full action. It is true
Borthwick is also remarkable in being, as it seems, the
first who had the title of 'Lord Advocate.' The learned Baron
Hume (Commentaries, vol. ii. p. 181) supposes this title
to occur in the records for the first time in the year 1598.
But the first time that it is a subject for remark, for we find
the king's advocate so addressed at the bar in the year 1573 (Pitcairn's
Criminal Trials), and again on the 23rd Oct. 1576 (id. ib.); and
in the Act 1567, c. 115, the title appears as the accustomed style
of that officer. The salary of the lord advocate at this
time was 40l. Scots yearly, and that of a lord of session
amounted to about the same sum. What the profits of
the bar then were may be guessed from Sir David Lindsay's
'Purman and Pardoner,' where the former says

1 half a gird but just an English groat.

So that the emoluments and practice of the learned
lord must have yielded him at least 100l. per annum, which though
but £5, £6, £7 sterling was a large income in those
days. Borthwick retained the situations of a lord of session
and lord advocate till his death, which took place in Jan.
1581, when his colleague Creighton, to whom the places
had long been objects of much desire, became sole lord advocate,
and also succeeded to the vacant seat on the bench.

An anecdote of this learned person is told by Scott of
Stenhouse. Borthwick had acquired various lands in
different counties of Scotland under the name of Culross or Fife;
but having seized his son James in several of them,
he had the mortification to see them sold or charged with
debt by the thrifless youth. When on his deathbed, hear-
ing that his son had sold the estate of Ballencrieff, the name
of which Borthwick had changed to Lochlhill, and that he
would descend with that of his posterity, the old man is
said to have bitterly cried out, 'What shall I say? I
do give him to the devil that doth get a fool and maketh not
a fool of him' which words became proverbial as Mr. David
Borthwick's testament.

BORYSTHENES. [DNIPPER.]

BOS. [BISON, BUFFALO, OX.]

BOS, LAMBERT, an eminent physician, was born at
Worcum in Friesland, November 3, 1670, where his father
was an emigrant, from a family in the village of Sleen,* and
the mother of David, was aunt to Vitringa. Having gone through
the classes in his father's school he became private tutor to the
children of a man of rank, in whose house he continued to
improve his knowledge in classics; then he went to the
University of Franeker, where his relation Vitringa
was professor of the Oriental languages, divinity, and sacred
history. In October, 1696, he was permitted to teach Greek
in the university, and in the month of February of the fol-
lowing year he was made a licentiate in that language.
In 1704, when the Greek professorship in
that university became vacant by the death of Nicholas
Blancard, the curators appointed Bos to be his successor,
who on taking the chair read a dissertation on the propa-
gation of learning by the Greeks through their colonies.
About the end of 1716 he was attacked by a malignant
fever, which ended in a consumption, a disorder which he
inherited from his mother. He died January 3rd, 1717.
About five years before his death he married the widow of
the celebrated English poet, John Dryden, also the
wife of Sir H. Schaffer, 2o. 8vo. Leips. 1807. 2. Observations Philosophica,
in quibus Novi Fedcris nonnulla loco pro
fonnis maxime auctoriis Graeciae illustrantur, 8vo. Franck. 1700;
republished in an enlarged form with the addition of
several Latin sermons by the Revd. Mr. Bymolgii Graeca, 8vo. Franck. 1713;
2. Mystere Ellini ad Grecos versus, 8vo. Franck. 1702. Of this work there have been numerous
editions. It was edited by Chr. Schottgsm, 12mo. Leips.
1713; by Nich. Schwelwe, 8vo. Norimb. 1763; and
with additions by Chr. B. Michaelis, 8vo. Hal. 1763.
Another edition of this work, published by the Rev. Mr.
Leips. 1689. 4. Oratio Inaug. de eruditione Graeci-
rum per Coloniae eorum propaganda, fol. Franck. 1744; 5.
Observationes Miscellaneae ad loca qaudam ovm Novi

* This is a term known in the law both of England and Scotland, and
attests the lord to a particular estate or place. The term is synonymous
with hargary, or nocturnal housebreaking; but this is not its meaning in
the law of Scotland. There it is the perfume seeking or invasion of a
peaceable house or tenement, breaking house with intent to
assault the owner; and this either by night or day.
Pheidias, tum extornerum Scipiorum Graecorum. Accedit Horatii Vitrigiae Amadversionem ad Iohannis Vorstii Philologiam sacrum Specimen, 8vo. Franca, 1707; 6. An encomium of the Sepulcher, elegantly and polemogena, 8vo., tom. 4to. 1709; 7. Antiquitatum Graecarum, principis Atticarum Descriptio brevis, 12mo. Franca, 1713. Of this work, which became a school-book, there have been various editions; it was republished with improvements by J. M. de Bures, 8vo. Lond. 1758, with a Latin translation into English by Percival Stockdale, 8vo. Lond. 1772; again in an abridged form, but with notes, by the Rev. John Seagar, 8vo. Lond. 1830; and lastly, with an appendix, by George Barber, 12mo. Camb. 1835. A French translation by M. le Grand was published at Paris in 1792.

9. In the same year was published a new edition of Well's "Grammatica Graeca nova," 8vo. Amst., adding two chapters on accentuation and syntax, shorter and more methodical than those of Well: this work was re-edited with Bos's and other notes by I. F. Fischer, 8vo. Leips. 1758. Bos's notes and emendations on Aristides are included in Jebb's edition of that author, 2 vol. 1752-30.

BOSCAN, ALMOGAVER, DON JUAN, was born at Barcelona in the year 1500 of a noble family. On his outlet in life he devoted himself for a short time to the profession of arms. He afterwards travelled, but the countries which he visited are not mentioned in the brief notices that remain of him. He was a man of erudition and became intimately acquainted with literature, it appears that he did not yet entertain the idea of transplanting the forms and manner of Italian poetry into Spain; for the poetry that he wrote in his youth was all in the ancient Spanish. But as the time approached he having lived at the court of Charles V., and having formed an intimate friendship with Andres Navajero, the envoy from Venice, he ventured to follow the counsel of this accomplished Italian, and assumed the character of a reformer of the lyric poetry of his nation, by writing sonnets in the manner of Petrarch in Italy.

The metrical structure of the sonnet had long been known in Spain; but the genius of Castilian poetry was adverse to that form, and a thousand voices were raised against him and his friend and more highly gifted fellow-reformer, Garcilaso de la Vega. Some insisted that a preference should be given to the old Castilian metre, on the ground of euphony. Others went farther, and asserted that the ear could perceive no distinction between the new hendecasyllabic verse and true prose. Finally, a third party discovered that Italian poetry, on which Boscan was translated into Castilian, was as offensive to the women. In fact, the attempt was considered nothing short of treason against poetry; and one of this sort of zealots, Cristobal de Castillego, goes so far in his satires against these innovators, whom he calls Petrarquistas, as to compare them to Cadi by another name of the latter of the religious doctrine, the subverter of the old faith. Boscan states that this violent opposition made him reflect seriously and hesitate in his noble task; but as he was soon convinced of the futility of the reasons urged against his literary reform, he persisted in carrying on; and through his perseverance, and the great talents and powerful example of his friend Garcilaso, his party rapidly increased, and obtained the superiority.

The urbanity of his manners and his abilities recommended him more particularly to the family of Alba, which was then one of the most brilliant among the Castilian nobility, and to which many Spanish poets constantly paid their homage. Boscan was for some time Ayo, or first governor, to the young Don Fernando de Alba, who was afterwards the terror of the enemies of the Spanish monarchy. He appears, however, to have resigned this employment, in order to divide his time between study and the society of literary friends. The year in which he died is not exactly known; it is only ascertained that his death happened before the year 1567.

Boscan's poetry is divided into three books. The first contains his Mar de Amor (the Sea of Love), and exhibits the fantastic flights of the old Spanish muse. The second consists of his Sonescoes and Cantaciones, which, although not a part of the same class of poetry, still play the spirit of the old poetry, in which the mild disposition of Boscan contrasts throughout with the enthusiastic vein of his model.

The third book is occupied chiefly by a paraphrasical translation of the Greek poem of Hero and Leander, the first of the kind which appeared in the Spanish language. It is accompanied with several elegies, and a declaration of the universal opinion, and a dissertation on the whole. The poet pleads for a new style, and his new method is vindicated. To this free translation succeeds a love elegy, the Capitulio, abounding in pleasing images, but too much diluted in words, like most Italian poems of the same kind. In the Answer to Don Diego Mendoza, the best of Boscan's sonnets, it is in other effects full of grace and animation.

Simplicity and dignity, poetic truth and feeling, are the characteristics of Boscan; but his chief merit consists in his courage and perseverance in carrying on the literary reform which was to enable Spain to rival Italy. His modesty moreover contributed not a little to attract to the party the more liberal of his countrymen. Had he commenced his labours by trying to beat down the old school he would probably have failed, for the party he had to contend with was little disposed to improvement, and far less to be taught by an arrogant master.

The eighth volume of the Parnaso Espanol, by Sedano, contains a supplement to the biographical notices which Nicolas Antonio collected under the article 'Boscan.' BOSCAWEN, EDWARD, second son of Hugh Lord Viscount Boscawen, was born at Great Leigh, in August, 1676. He was placed in the navy early in youth, and at the age of twenty-one was lieutenant of the Hector. In 1740 he became captain of a twenty-gun ship, the Shoreham; and in the following year, under Admiral Vernon, acquired considerable distinction for the capture of the Paul Nurse, by the taking of the fortified city of Puerto Bello, on the Isthmus of Darien.

Shortly after, at the siege of Carthagena, he led on a body of seamen, and resolutely attacked and took possession of a fascine battery of fifteen 24-pounders, as well as a line of fifteen 12-pounders from an adjoining fort. On the death of Lord Boscawen, he took upon the command of the Prince Frederick of 70 guns. In 1742 he returned to England, married the daughter of William Glanville, Esq. of Kent, and in the same year was elected a member of parliament for Truro. In Cornwall he saw the declaration of war with France, and he took the command of the Dreadnought, captured in April, 1744, the French ship Medea, and landed at Spithead with 800 prisoners. As captain of the Namur of 74 guns, he greatly signified his zeal and goodwill by an efficient engagement of Cape Finisterre, when a capture was made of two large French ships of war. In the commencement of the action he was struck in the shoulder with a musket ball. He was made in the same year rear-admiral of the blue, and returned to England, where he served for some time as commodore of the ships sent to the coast of China, and afterwards as a commissioner for the war in India; and he sailed in November from St. Helen's Road, in the Isle of Wight, with six ships of the line, five frigates, and 3000 soldiers. In July, 1749, his fleet appeared before the fort of St. David's, which is 15 m. S. E. of Pendine, and having marched his army to Pendine, and begun the siege, he was obliged, in consequence of the sickness of his men, and the approach of the mousons, to return to his ships; and is said to have made the retreat with prudence and skill. He soon afterwards joined with Admiral Mostyn and Admiral Cranfie, in the engagement of Pencaw, when the news of the declaration of peace, was delivered up to him by the French. In 1750 he arrived in the Exeter at St. Helen's, and found that in his absence he had become rear-admiral of the white. In the course of the following year he was made a lord of the board of admiralty, an elev in the Order of the Garter, and again a representative for Truro. In company with Admiral Mostyn, he sailed in April, 1755, from Spithead with twenty-four ships, to intercept the French squadron bound to America with supplies. Of the coast of Newfoundland they took in with their fire two prizes, and captured early in the year 1500 prisoners, including the French commander Hoquart, who had twice before been defeated and taken prisoner by Boscawen. On his return to Spithead with his prizes, he received for this important service the thanks of the country, and his ship was decorated with the Colours of Great Britain, and sent to America, ordered to North America. A fleet of 161 ships (Ann. Reg. vol. 4. p. 70), with 14,000 men, was fitted out, and Boscawen, now promoted to the rank of admiral of the blue, was
appointed commander-in-chief of the expedition. In February, 1758, accompanied by General, afterwards Lord Amherst and General Wolfe, he sailed with these forces for Halifax, and on the 3rd of June arrived off the island of Cape Breton and St. John, were taken, after some severe engagements, by the English admiral. In the following year, 1759, he was stationed with fourteen ships of the line and several frigates in the Mediterranean, where for the last part of the year he commanded the fleet of twelve large ships of war, through the Straits of Gibraltar to the Bay of Lagoons; where he overtook them and fought a furious battle, which terminated in the burning of two of the enemy's ships, and the taking of three others, with 200 prisoners. The British fleet, under Victory, under Nelson, on shore and died, in consequence of being struck by a cannon-ball which carried off both his legs. Upon the return of Boscawen from England, the thanks of parliament were again conferred, with a pension of 300L. per annum, which was a matter of the privy council. At this time he received also the additional appointment of general of the Marines. In the summer of 1760 his fleet was lying unemployed in the Bay of Quiberon, on the western coast of France, and it is worth recording, as honourable to the humanity of the great man, that when a great many among his crews were suffering from the scurvy, to which seamen were at that time very liable, he landed on a little island near the river Vannes, and daily for several months employed himself with a party of his men in curing the garden, in order to procure vegetables and wholesome provisions for his men. On January 10th, 1761, he died at Hatchland Park, his residence, near Guildford, at the age of fifty, and was interred in the church of St. Michael Penkevill in Cornwall, where a beautiful monument by Rysbrach, said to have been to his memory. The mind of Boscawen appears to have been wholly intent upon his professional pursuits, and but little influenced by the spirit of political parties. His ability and courage as a naval and even as a military officer were highly appreciated by Lord Chatham, who is said to have often observed, that when he proposed expeditions to other commanders he heard of nothing but difficulties; but that when he applied to Boscawen, expeditions were immediately suggested.

BOSCOVICH, ROGER JOSEPH, was born at Reggusa, May 11, 1711 (May 18, 1701, according to Lalande), and entered the order of Jesuits in 1725. He was appointed professor at the Collegio Romano in 1740 (Lalande), and was employed in various scientific duties by several popes. He was a frequent member of the committee of the Curia for the dispute between that state and Tuscany, and at London in a similar character on behalf of his native place (1762). He was recommended by the Royal Society as a proper person to be appointed to observe the transit of Venus at Quito, and his expedition from the neglect of the Jesuits was the cause of that acceptance of the appointment. After this event he was made professor at Pavia and subsequently at Milan. In 1773 he was invited to Paris, where the post of Directeur d'Optique pour la Marine was created for him. He left France subsequently, on account of the hostility of Condorcet and D'Alembert, as Lalande affirms, or because he disliked the irreligion of the French savants, as Hutton states, probably a part of the reason of Lalande's unwillingness to Boscawen (the éloge we have not been able to find). He settled however at Milan, where he was received with distinction, and was appointed to measure a degree in Lombardy. He was seized with melancholy, amounting almost to madness (Hutton from Fabroni), and died February 13, 1767.

Boscawen was a man of very varied attainments and considerable mathematical power. The different accounts of him partake of the bias of their several authors. His countryman, Fabroni, rates him as a man to whom Greece and ancient Rome did not do more honor. He even throw down a hero or two to make room. Lalande, to whom a voluminous and miscellaneous writer was a brother in arms, affirms he had as much talent as D'Alembert, though not so much of the integral calculus. The Jesuits were not in favor with the French government; the ignorant and unskilled writer it is some truth in the account of Lalande with respect to D'Alembert. Delambre says, 'in all his dissertations we see a professor who loves to converse much better than to observe or calculate,' which seems to us perfectly true; but at the same time Boscawen was a man of talent, though not of first-rate power or energy; exceedingly fertile in ideas of merit, but not of first-rate merit. The excessive number of papers in the length of his life are not known than it deserves to be, since there is not among them any one point d'appui for the highest sort of renown.

Boscawen was one of the earliest of the continental Newtonians, and introduced the doctrine of gravitation at Rome. In his first article, he published the first explanation in the comprehensive form of the problem of the orbit of the planet Mercury, in an explanatory tract published at Rome in 1745; but in his Philosophiae Naturalis Theoria, &c., Venice, 1758, he endeavours to apply the same principle to the actions of molecules on each other. It is remarkable that in spite of the objections of the Copernicans and Galileans (the latter by the Superintendents of the Index Expurgatorius), two Jesuits published an edition of Newton in 1758, and a third began to teach it at Rome in 1740. But previously to this (1736) he had distinguished himself by a solution of the problem of the flight of the sun's beams and rotation by observation of the spots, which Delambre calls one of the most elegant which had been given. It was the first of its kind.

In 1756 he began to measure an arc of the meridian from Rome to Rimini, by order of the pope, and the account of this celebrated and useful operation (which was carried on in conjunction with Christopher Maire, another Jesuit) was published in 1755. But Boscawen informs us, that while he was riding about or waiting for his observations, he was often accosted by his own fellow-religious, who entreated him to take a careful, unhurried, and extended examination of the sun and moon. These verses were published at London in 1761 by Millar and Dodalay, in six books, entitled 'De Solis et Lunae deflectibus.' It is lucky for the fame of Boscawen that the degree he measured was not as poetical as his next one, for the same allegorical scheme that can hold a good observation, and the second is best described by Delambre's remark, that it is un instructive to an astronomer and unintelligible to any body else. We have noticed it because we conceive it is the best channel through which an Englishman who reads Latin and who can (in another language) can make a personal acquaintance with this author. Being published in England it is frequently found among the second-hand booksellers; and the notes, which are often more poetical than the text, contain a large collection of his observations.

The degree of the meridian above-mentioned, his theory of comets, application of mathematics to the theory of the telescope, and to the perturbations of Saturn and Jupiter (of which Lagrange said that the motto 'Iam olim, nunc fragmenta' is the most auspicious among his maxims, because a good thing in it), the discussion relative to the invention of the double-refraction micrometer, the application of the differential calculus to problems of spherical trigonometry, together with his dissertations on various points of physics, will be noticed in their place. In the course of his observations they influence the history of the several sciences advanced. He was now merely notice 1. The 'Elementa Universis Mathematica,' &c., Rome, 1754, a course of mathematics for his pupils; 2. The collection of works alluded to above, 'Opera pertinencia ad Opticam et Astronomiam,' &c., 5 vols., Basso, 1765; and 3. The work on the degree of the meridian above-mentioned, 'De Litterariis Expeditione per Pontificem Ditionem ad Metiendo Duas Meridianas Gradus,' &c., Rome, 1755. This work is much more esteemed than the French translation, 'La Grande Exploration des Deux Méridiens,' 1762, which of course is now much reduced. (Bios. Unis.) We may refer for information to the usual authorities and also to the éloge of Lalande (besides that of Fabroni above-mentioned) in the 'Journal des Savans, 1762, p. 411.'

BOSJESMANS, literally 'bushmen,' is the name which the Dutch colonists at the Cape of Good Hope have given to a wild and roaming race of people, who live about the northern skirts of the colony, and as far as the Orange river, without any settled habitations or kraals, and who are not the same as the Bushmen of the interior. If we know nothing of the origin of the Hottentots, it is impossible to say whether the Bosjesmans remained in a wild state while other tribes became settled and partially civilized, or whether they were stragglers from the settled Hottentot.
tribes who fell back to a wild state. Their language ap-
pears to bear some analogy to that of the Hottentot, although the Boesjeman and the Hottentot do not understand each other. What remains of the language of the Boesjeman is, of course, only the Hottentot have it stronger and more frequent, and they draw out more the ends of their sen-
tences.

Lichtenstein says that the Boesjeman are a distinct peo-
pal; he acknowledges that they have the universal distinguishing features of the Hottentot, their broad flat
face, the long prominent cheek-bones, and the yellow-brown
hue of the skin; and that their physiognomy has the same
characteristic features as that of the Hottentot, only more
wild and animal among themselves, and with the whites.

They are neither husbandmen nor sheep-
herds; they have no cattle or flocks, but kill wild animals
with their arrows, catch fish, and also feed on locusts,
snakes, ants’ eggs, and insects, and upon roots and berries.
They are capable of bearing hunger for a long time, and,
like other savages, they eat voraciously when they fall in
with plenty. The Boesjeman are generally very lean,
and of a low stature, if stunted in their growth. A
sheep-skin fastened round the neck with the woolly part
inside, a greasy leather-cap on the head, with their woolly
hair smeared with grease and dust, and tied in a
number of knots hanging down, a jackal-skin fastened with a leather
thong round the middle of the body, sandals of ox-leather
bound round the feet, a low and a quiver with poisoned
arrows, and a wooden sword on the back, and either a
knife or three straw mats, which being placed on sticks form,a
sort of tent,—these constitute all their apparel, furniture,
and utensils. They catch sea-crows in pits on the banks of
the Orange river. They sleep in caves, or more commonly
sleep upon ground. They have no fires, but sleep with
the air and sun. They are not connected in any considerable numbers, but wander about
in small parties, consisting of individuals of one family,
or such as meet by chance. Their wild, shy, suspicious
eye, and cruffy expression of countenance, says Lichten-
stein, “form a striking contrast with the frank open phys-
ionomy of the Hottentot.”

When the Europeans first extended their settlements to the Snow Mountains, there
were no Boesjeman there; the country was peopled by
settled tribes of Hottentots, but the report of the wealth of the
Boesjeman was current at that time, and they were
welcomed by the Orange river. They were then,
and had been from time out of date, in a state of
war with the settled tribes of both Hottentots and Caffres,
whose cattle they stole whenever they had an opportunity.
They are said to be very much against the Dutch colonists,
who, in their turn, waged a war of extermination against them. At last, towards the be-

ing of the present century, attempts were made to
establish some sort of truce between the Boesjeman and the
Caffres. The Boesjeman are considered to be possessors of gold,
tobacco, tea, and other articles. In one instance, the colo-
nists gave to a party of Boesjeman a number of cattle
and sheep, that they might become settled and tend their
flocks; but other parties came from the interior, killed the
cattle, fed on the flesh as long as it lasted, and then
resumed their wandering life.

It appears however that the rapid spread of civilization during the last thirty years has had some effect, even on
the wild Boesjeman. The Rev. John Campbell gives a
narrative of the methods by which these people met both south and north of the Orange river;
he employed them as guides, saw many of them employed as
domestics by the colonists, or by the Kurrana Hottentot,
and they appeared to behave well and faithfully in their
respective capacities. He met kraals of Boesjeman north
of the Orange river who seemed to live in peace under
a chief, who told him “that they had plenty of game and
water, that they took nothing from anybody, and that
they should be glad if any one came to teach them what they
did not know. They have now a regular cattle industry,
and no subsistence beyond hunting and fishing, no
dress but skins, and no weapons but arrows. The great
tract between the northern border of the colony and the
Orange river is still occupied by wild Boesjeman, who
however are becoming civilized. The Kurrana Hottentot,
who live north of the Orange river, are also a check upon them. In fact, the Boesjeman
are beginning to be surrounded by civilization, and con-
sequently they must either become civilized themselves
or become extinct.

(Lichtenstein, Burchell, Campbell, Thompson.)

BOSKOVITZ, a small castle of Brim in Moravia, situated on the banks of the river of Svitvit,
which borders the circle of Oldmitz; the hill itself is
encircled by the riv. Biala and that side of it behind the
town is a mass of precipitous rocks. It is the property
of Count Dietrichstein, and is remarkable both from its site
and its position. It is the residence of a noble family, who
live in a distinct quarter of the town.

The Dietrichstein family have a palace at Boiskowitz,
and are proprietors of the town and the territory near it.

BOSSNA-SARAI (or SARAJEVO), formerly the cap-
pital of the kingdom of Bosnia, and at present one of
the principal towns in the Turkish eyalet or province of
Bosna, is built upon the ruins of the ancient Tiberiopolis.
It contains 50,000 souls, and is situated on a fertile plain
large in circuit as Adrianople; it contains 100 mosques,
great and small, and among which that of Chosrem-beg with its
clock (a great rarity in Turkish towns) best deserves
notice; one serai or palace, erected by the great sultain
Mehmet IV., and the remains of the Minorite order, a number of madressas or schools, baths,
and charitable institutions; two large bazaars or bessetans,
several market-places, between 14,000 and 15,000 houses,
mostly built of wood, with latticed windows, and a pop. of
about 60,000, one-third of whom are Musulmans, and
the remainder Roman Catholics, Jews, Greeks, &c.
The town is handsomely built, and has a gay oriental appearance from the number of minarets and steeples which embellish it.

Bosna was the residence of the governors of the prov-
ince, and is the residence of three times until the aeries committed by one of them drove the inh. to revolt, and he was obliged to flee to Travnik, where his successors have since
continued to reside. The people are an industrious race, and
manufacture armes, utensils of copper, which they sell and use, and even sell to the Turks; and in the
Turkish markets, iron-ware, woolen and worsted stuffs,
morocco-leather, horse-hair bags for holding rice, cottons,
&c.; there are also several tanneries in the town.

Bosna-Sarai, being the staple mart for the whole prov.,
is a place of considerable trade; and is the only place of
importance on the E. of it, as well as of its situation on the declivity of the Dinaron Alps, is to render the climate chilly and bleak,
though not to such an extent as to prevent fruit or even grapes from ripening. On a plain which stretches W. of the
town as far as the banks of the Bosna, are the baths of
Serajeveko.

BOSSNA, or BOSSNA, one of the eyalets or prov.
of Turkey in Europe, derives its name from the riv. Bosna,
which runs through the heart of it; it extends from 42°
40' to 45° 29' N. and from 15° 29' to 15° 40' E. of
long. According to the subdivision laid down by the Turkish
government in 1824, it comprehends 6 sandbezaks, or circles;
namely, Travnik, Banyaluka, Serbernik, Isvorick, Novi-
bazar, and Hersek, the first four being composed of Bosnia
Proper and Turkish Croatia, while Novibazar consists of
that part of Servia which was added to Bosna in 1815, and
bears the name of Racia from its being watered by the
Raca, and Hersek of the Herzegovina and Turkish Dal-
mata. These six sandbezaks are again subdivided into
40 circles; one of these, the bosnitz, or circle, is
bounded on the N. by Austrian Slavonia, the Unna and
Save partly forming the line of demarcation, on the E. by
Servia, on the S.E. by Albania, on the S.W. by Austrian
Dalmatia, and on the N.W. by Austrian Croatia. It is the
strongest in population of all the Turkish provinces, and
contains, according to a recent writer (von Zedlitz) about
22,300 sq. m.; though others, who have probably omitted
to include the late additions of territory in their estimate,
do not assign it a greater area than 16,000 sq. miles.
Bosnia is a mountainous country, and contains many deep valleys, but only one plain of any considerable extent. The principal river is the Drina; some of the other streams of the sandy basin of the little Dinaric range, which enter it on the side of Austria. The Dinaric range, indeed, after traversing the prov. from N.W. to S.E., continues along the S. frontiers, where some of its peaks are above 6000 ft. high; distinct parts of it are known in the shape of detached mountains, as the Krakow, the Uliassa Kossa, Czernagora, Velicki, Radacza, Ivan-Planina, Nissova-Gora, Baba, and Torba-Planina. There are three offsets from the main mass of these Alps, which slope down to the banks of the Save, and divide the land into four natural portions; the one lying between has the Unna and Verbas, the second between the Verbas and Bosnia, the third between the Bosnia and Drina, and the fourth between the Drina and Morava. The lower regions of the Dinaric range are in many parts entirely naked, those immediately above them, however, with patches of forest, the uppermost consist of rocks thinly interspersed with wild rosemary, thyme, and other low plants.

The Save, the principal riv. in Bosnia, first waters its territory in the N.W. at the point where the Unna falls into it, and running in an E. direction somewhat inclined to the S., constitutes the whole N. boundary between Bosnia and the Austrian possessions; its frequent inundations make extensive swamps, the largest of which, the Shirma, lies to the W. of Bogudria. The Unna, one of the tributaries of the Save, forms part of the border between Austria and Bosnia. The waters of Zetina and Vitovogos, not far from Oberenacsa, winds N. past Biaza and Novi, at which last place it receives the Sana, and ultimately flows into the Save, after forming part of the N.W. frontier on the Hungarian side; namely, from the latest of the Carniades, down to and including the Save, it has its efflux. This riv. is not navigable, though even when not flooded it is from 6 to 7 ft. deep, and from 200 to 400 ft. wide. The Verbas, another Bosnian river, rises in the heart of the country at the foot of Mount Radusa or Radun, and flowing through the chief castle of Croatica from the Herzegovina, flows in a N. direction past Bosacsa and Banyaluka, receiving on its right bank the Veliki, Ugar, and Verbanya, and on its left the Pliva, and unites with the Save to the E. of Gradiac, after a course of about 130 miles. The Bosnia rises to the W. of Scrizero on Mount Trebevic, part of the N. declivity of the Ivan-Planina range, flows N., receiving in its course the Miglavaza, Sjubina, Spreca, &c. on its left bank, and the Misna, Feiniczia, Lepenizica, &c. on its left, and after running about 140 m., falls into the Save near the Lukatscher Schantzte (L. Fort), below Brod. Vissoko, Zenica, Vrinduck, Slobeta, Doboli, Kotorsko, and Dobor lie upon its banks. The Drinna, another considerable riv. spring from the foot of the Lesina range to the W. of Sребреница, divides the territory of Bosnia into two (L. Fort). The Servian fervent agriculturists, running N. past Zvornik until it reaches Lebnicez, where it enters a level country, and afterwards the Save to the right and left of the S. and Shabec; its channel in this quarter is again narrowed by mountains. In its course it receives the Travnik, Pima, and Limus. This riv., as well as the Verbas and Drina, is navigable for vessels of about 50 tons, and its waters, like those of the Verbas, bring gold-dust down with them, which the Turks, it is conceived from jealousy, will not allow to be collected. The rivers of importance in S.E. part of the country, and the Moraks or Boyana in the sandshak of Hersek, which runs through the Boysana lake and falls into the Adriatic on the Austrian coast: together with the Baba, Neretva, or Narenta, and Rama, and other tributaries of the Bosna, form the main body that is called the laked rivers of Bosnia, and, second in importance, the largest being the Mostarska Bato. It contains a number of mineral springs, among which the warm baths of Novi-Bazar and Budimir, and the acidulous waters of Lepenicz and Kiselak, are most in repute.

The temperature of the country is liable in the spring to heavy falls of snow, which lie on the low lands for many weeks. In summer heavy falls of rain, and outbursts of water-spouts are of common occurrence, but they are highly beneficial in moderating the heat. The chief crops of the bosnian land, as may be inferred from these facts; that wheat is harvested in July, and grapes are stored in August. The air is said to be healthy at all seasons, though the dry nipping Borra, or north-easter, is frequently prevalent.

The soil of Bosnia, as might be expected from the mountainous character of the country, is in general of a rocky and stony nature, adapted rather for rearing cattle than raising crops. The best pasture is in the valleys near the rivers, which are very productive. Wheat and barley, but not much rye, are grown in the level lands, and maize is a favourite object of cultivation about Novi-Bazar and along the banks of the Unna; the greatest corri- dori or arable districts are on the borders of the Zetina and the Save; and the produce is seldom made into bread, but consumed in the shape of cakes or mamaliga. Pease and beans are extensively raised; and flax and tobacco are grown in the neighbourhood of Zvornik and Novi-Bazar. Fruit of course is abundant in a country which has whole forests of fruit trees; the chestnut and mulberry are common, but no silk is produced. The plum is of great use in making a species of brandy, called Stivavica, which is chiefly consumed by the Bosnians themselves; and a luscious liquor, termed Pomace, is manufactured from the fruits of chestnut. The wines are strong and fiery, but owing to ignorance of the art of making them, they will not keep: the best are made in the environs of Mostar and Novi-Bazar.

The high lands and mountains of Bosnia are so densely covered with forests, as to many parts to form impenetrable wildernesses; the trees of which they are principally composed are the oak, beech, pine, fir, and linden; hence the country produces and exports timber for all purposes, whether for building or fuel, and much pitch, tar, and turpentine. The mountains of the Bosnian province, which despatch large quantities from that spot to Zemlin and other parts of Turkey, by water-carriage along the Drina, Save, Danube, &c. The Bosnian woods abound in wild animals; deer, boars, bears, wolves, lynxes, and foxes; and the killing of domestic animals has received little attention; for instance the breeding of horses, of which Bosnia possesses a strong and hardy race, is neglected almost everywhere except in the innoxious districts of Kljuce and Glamoce, which is wholly devoted to it. The usual type of cattle are kept, and bullocks form a considerable article of Bosnian export. The only buffaloes are those fed for private use in the sandshak of Novi-Bazar. Many of the sheep have upright windings horns, and coarse knotted wool, and are of a large size; the Wallachian and Dalmatian breeds have also been introduced. The Bosnians in general pay much attention to their flocks, and the wool they send to market is considered the best in the Levant. Goats are common; swine are fed by all who reside near the Save and Drina, where they have the advantage of extensive woods of oak and beech; and look a great deal better there where the rivers abound with fish, but the supply is mostly consumed in the country itself. Much honey is made, but the wax is of indifferent quality.

Mining has not been carried to the extent which the undoubted richness of Bosnia would lead one to expect. The Turks have hitherto manifested an almost unaccountable repug- nance to allow them to be turned to account. The mountains round Bosnia-Sarai are said to contain large quantities of gold and silver; and in the centre of an extensive dense wood about 7 m. from Travnik, the excavations of the cele- brated gold-mine of Ilatzniza (literally signifying gold in the Bosnian tongue) are still visible; but the inhabitants are so timid as to be afraid of venturing near them. There are silver-mines near Srebrenica on the Drina, Kuppa on the Unna, and a lead- and tin-mine near the Verbas. The iron-mines in the vicinity of Bosnia-Sarai are worked by gypsies with the simplest mechanical means that can be imagined. They are situated near the Franciscan monasteries of Feiniczia, Sutitska, and Kressovo, where there is a number of smithies, in which horseshoes, nails, locks, iron-plates, and other wares are manufactured; some iron is also raised at Vukup, Stari-Maidan, Kamengrad, Vissoko, and Varos. The quicksilver-mines near the monasteries of Kressovo are rich, but wholly neglected: a lead- mine is said to be the nearest to the Bosanas, but the veins are fine quarrs of free-stone and mill-stones, alabaster, and marble, as well as coal-mines and saline springs; the most remarkable of these springs flows out of a cavern near Tuzla, but it is turned to no account, and all the salt contained in the spring is imported from Hungary.

Bosnia possesses some inconsiderable manufactures of leather, coarse woollens, worsted coverlets, and other woolen stuffs. There is a manufacture of cannon-balls at Kamengrad, a salt-petre work at Jazice, and powder-mills at...
Bhazza, Otsorwze, and Banyaluka. There are iron-ware manufactures at Bosna-Sara; they include fire-arms, swords, and small ware; and similar fabrics are made at Shebse, Banyaluka, and Mostar. In Mostar Damascus blades are also made.

The exports of Bosnia consist of wool, honey, and wax, goats' hair, hiles, morocco and other leather, timber and other articles of wood, worsted coverlets, &c., horses, horned cattle, sheep, goats, swine, poultry, dried fish, mineral water, pitch, and other domestic produce: and the imports consist of linens, woollens, silks, cotton goods, glass-ware, flax, needles, paste of lead, copper and iron-ware, quicksilver, drugs, indigo, colonial produce, &c. The principal

ports of trade are Bosna-Sara, Zvornik, Banyaluka, Mostar, Dervent, and Berb, or Turkish Gradsica. Bosnia carries on a considerable transit-trade with the adjacent countries, and the products chiefly come in through Kostainica, Brol, and Alt-Gradsica, and ports through the six depots established on the frontier, or by caravan to Zara and Spalatro. The roads are bad and almost impassable except for horses, as is the case throughout the Turkish territories. Independently of the great road from Brol through Travnik, and thence to Bosna-Sara and Constantipole, there are only seven other highways for internal intercourse.

It is impossible to give a correct estimate of the pop. of Bosnia. Some writers state it at a million; others at 220,000, and 82,000 to 100,000. (Zanzib.) In his 'Survey of Bosnia, Rasic, the Herzegovina, and Servia in 1823, gives us in one portion of his work the following enumeration:—Bosniaks, the aboriginal race, 220,000; Servians, 120,000; Turks, 220,000; Mortachians, 75,000; Croats, 40,000; kyp- sians, 7,000; Panticapaeans, Arabians, 2,000; and all the rest of the population, 737,800; but in a subsequent page, he speaks of the religious sects into which the inhabitants are distributed as consisting of 450,000 Mohammedans, 250,000 Roman Catholics, 220,000 Greeks, 200 Jews, and 600 Armenians; in 1226, 442,000. The inb. of Bosnia are composed of Bosniaks, a race of Salavonian origin, who chiefly reside between the Verbas and Drinna; Servians, dwelling partly in the sandshak of Novibazar, and partly on the E. bank of the Drinna; Croats, who inhabit places in the vicinity of Yass and Varnak, and Montenegro, principally situated in the sandshak of Hersef; Turks, who are settled in almost every town, and likewise people exclusively the district of Kline; Armenians, a few Greeks; and lastly, Jews. The majority of the pop. are of the Greek faith; a portion of the Bosniaks and other inb. profess the Roman Catholic faith; the Turks and many of the Bosniaks adhere to Mohammedanism.

The civil administration of Bosnia is on the same footing as that of the other eyalates of the Turkish dominions. It is governed by the pasha, who resides at Travnik, and is the head of the six sandshaks, who are pashas of two tails, are subordinate. The judicial system consists of a cadi, who exercises jurisdiction over certain districts, even with reference to such as are not Turks, although the Bosniaks and other non-Mohammedans have their village magistrates, from whose decisions there is seldom any appeal to the cadi.

The revenue of the province is estimated at about 700,000L. or 800,000L. per annum; though not more than 300,000L. is said ultimately to reach the Turkish treasury. The land revenue of Bosnia is derived mainly from the cultivation of corn, from nine to thirty shillings a year, which every male non-Mohammedan pays after attaining his seventh year; of taxes on land, houses, trades, &c.; excise duties, customs dues, and judicial penalties.

The greater part of the land of Bosnia is divided into six sandshaks, which are of varying size and strength. The dominant town of each sandshak is Travnik, which lies in the S.E. part of Bosnia Proper, Bosna-Sara on the Migliazzia; and Travnik, at the confluence of the Lasha and Voroilaca, where the pasha of the province resides, about 8000 in.; Banyaluka, in the W. part of the country, is the residence of the Viceroy; Pagra, the town of the same name, lying on the Verbas, which is fortified and has about 16,000 in.; Yaiaca, formerly the capital of Bosnia, at the junction of the Pliva with the Verbas, a walled town with a pop. of about 3000; Kamangrad, a market town, lies about 14 miles from Yaiaca, and is the seat of the Austrian town of Gradsica, a strongly fortified place; Srebrenik, in the centre of Bosnia, between the Oktina and Drinna, has the town of that name for its capital; it is situated on a small stream that joins the Save; Zvornik or Zvornik, in the N.E. part of Bosnia, also takes its name from the principal town, which lies on the left bank of the Drinna, is defended by two castles and other works, and contains about 15,000 in.; Novibazar, in the E. part of Bosnia, of which the chief town Novi or Venibazar is situated on a small tributary of the Ybar, in the bosom of a highly productive district, defended by a citadel, and having about 10,000 in.; and Nican, the chief place in which is Trebinga, on the Trebinje, a strongly fortified town with about 10,000 in.; and next to this, Mostar, on the Narenta, a fortified town with a pop. of about 8000.

BOSPHORUS, often incorrectly written BOSPHERUS, is a pure Greek word (Βόσπορος) according to mythological tradition it derives its name from the passage of Io over one of the straits so called, when she was turned into a cow (Aesch. Prom. 735); the Bosporus, as thus explained, literally signifies the passage of the cow. Two straits are mentioned by Homer, the Greek and the Roman or Black Sea. One, now more commonly called the Channel of Constantipole, unites the Propontis, or Sea of Marmora, to the Black Sea. This narrow channel was often called the Thracian Bosporus, by way of distinction from the other named the Cimmerian.

The present straits of the Bosporus were formed when the straits of Kaffa or Yenikel, is the narrow passage which connects the Palsus Maecis or Sea of Azo with the Black Sea. (Azo.)

A narrow strip of low and fertile land on the S.E. margin of the Taurus-Chersonesus, the modern Crimea, formed the ancient kingdom of Bosporus. It extended about 60 m. in length, direct distance, from Theodosia or Thodosia, now Feodosia or Kaffa, on the W. to Panticapaeum or Bosporus, now Kerch, on the straits of Yenikel. Both Theodosia Panticapaeum, and Kerch, have lost their ancient character; the cadi's seat is a small town with good ports; and between them was Nymphium, which also, had a good harbour. Panticapaeum was a Milesian colony.

The territory already described, the Greek kings of Bosporus possessed Phanagoria, now Gudauta, on the E. shore of the straits of Yenikel; and finally they seem to have become masters of the whole Crimean. The series of Greek kings from c. 430 to B.c. 304 (so far as yet known) is as follows:—Ar- chanaxieide (Diog. xii. 31) c. 480; Spartaces L. 436; Spartan, 428; Mithridates the Young, 421; King unknown; Satyrus I. 407; Leucos, 393; Spartaces II. 353; Parysades (Pariades on his medals), 316; Satyrus II. 310; Pytanias; Eumolus, 309; and Spartaces III., c. 304. (Clinton, Fast., vol. i.) All of these kings were known to us from Demosthenes (Oration Against Leptines), who may be considered his contemporary. During the reign of Leucos, and that of Satyrus his predecessor, the Athenians imported large quantities of grain from the Bosporus: indeed Demosthenes asserts that the Greek kings of Bosporus were the only source of all the corn imported from all other foreign places. A mutual good understanding subsisted for some time between Athens and the king of the Bosporus.

A later date the Bosporus formed part of the kingdom of the great Mithridates, who is said to have died at Panticapaeum. The kingdom of the Bosporus, with all the neighbouring districts, fell into the hands of the Romans, who gave it to Pharnaces, the son of Mithridates, Pharmaces having intraded Pontus and exercised great power over the Bosporus, and had called himself Roman king by the aid of the Cossars and Creuses. He fled to his kingdom of Bosporus, where he was immediately murdered, and his throne was given by the dictator to Mithridates of Pergamus (about c. 47). This kingdom of Bosporus continued under the Roman emperors, but was only known to us from occasional interferences of the Cossars in the nomination of a king, or in attempts to restore tranquillity. (Tacit. Annal. xii. 13—21.) A race of half Greek, half barbaric kings continued to possess the Crimea and the neighbouring coasts of the Black Sea, and the kingdom of Bosporus almost survived the Roman Empire, and only expired under the ravages of the Huns.

A great quantity of Greek antiquities, including coins and inscriptions, have been dug up at Panticapaeum and other places in the Bosporus; but none were discovered at Bosporus. Coins of Leucos, of Pariades, of the town of Panticapaeum, and others, have been found: some of these, such as the coin of Pariades, are exceedingly fine; others that belong to the period of the Roman Empire are ruder. Rasoul-Bochette has published two medals of Rhescuporis,
on one of which he is styled Julius, and on another Tiber-
ianus Iulius. R. Rochette conjectures that Rhesecourts took
this medal about A.D. 6 or 7, when Tiberius, during the reign of
Augustus, was in Illyria with a powerful army. (Dion
Cas., lib. iv. c. 27, &c.; Sueton. Tiber. 16, 17.) Two coins
of Cotys are also published by R. Rochette, but it is difficult
to determine what prince or princes these medals are to be
attributed to. (Strabo, pp. 309, 493, &c.; Raoul-Rochette,
Antiquités Grecques du Bosphore-Cimmérien, Paris, 1822.)

BOSSINEY with TREVENNA, a bor. and m. t. in the
dist. of St. Ives, co. of Cornwall, 13 m. n. by w. from Penzance,
and 258 W. by S. from London.

The bor. of Bossiney extends over a great part of the bor.
of Tintagel, and comprises about 360 English acres. The
property is partly a borough by prescription; but it appears
from the charters that the present town hall is a house above the value of 10l., and none above that of 20l.
The assessed taxes on 5th April, 1831, were 45l. 15s. 4d.

Bossiney has a market on Thursday, and a fair, which is
now held at Trevenna, principally for horned cattle, on the
first Tuesday of March, and the Tuesday of Ascension. The
town hall is chiefly used as a charity-school, to the master of which the corporation pay a salary of 10l. per annum.

Bossiney is situated on a wild bleak part of the N. coast of
Cornwall, and appears formerly to have been of a place of
some importance, Leland, in speaking of it, says—"Bossi-
ney hath beene a bygge thing of a fischar towne, and
luth grete privilages grunted unto it. A man may see there
the ruins of a grete number of houses." Near this place is the castle of Tintagel, supposed to have been the birth-place of the famous King Arthur. Built on a high rock that juts out into the sea, by which it is nearly surrounded, this castle must have been a place of
considerable strength. Both Norden and Carew speak of it
as almost inaccessible, and Leland calls it "a marvellous
strong and notable fortress, and almost situ loci inapprau-
vable." In his time a chapel seems to have occupied part
of the site of the keep, which he calls the dungeon of St.
Ulette, alias Uianne.

The church of Tintagel is supposed by the author of the
Magni Britannia; "lie a speaking of it, says—"Bossi-
ney hath beene a bygge thing of a fischar towne, and
luth grete privilages grunted unto it. A man may see there
the ruins of a grete number of houses." Near this place is the castle of Tintagel, supposed to have been the birth-place of the famous King Arthur. Built on a high rock that juts out into the sea, by which it is nearly surrounded, this castle must have been a place of

s’Histoire Universelle, which he published in 1681. It consists of three parts, the first of which contains an abridgment of universal history, from the Creation to the reign of Charlemagne; the second embraces the chief proofs of Christianity; and the third attempts to unravel the causes of the rise and decline of nations. Upon this work Voltaire, in his History of France, observes, that it is the most eminent eloquence; and of the first part, which most readers would suppose to be little more than a dry index, a later critic (Mr. Charles Butler) has declared that it scarcely contains a sentence in which there is not some noun or verb that conveys an image or suggests a sentiment of the noblest kind.

The chief reward with which Louis compensated the services of Bossuet in the education of the Dauphin was the bishopric of Meaux, to which he was consecrated in 1651. He filled also the high posts of master of the domain, president of the College of the Sorbonne, councillor of state, and first almoner to the duchess of Burgundy. He had the distinguished honour of heading, jointly with Mdl. de Maintenon, the deputation appointed to receive the last-named princess when she came from Bavaria on her marriage. On that occasion Madame de Sevigné writes, with not less than causticity, ‘if the duchess thinks all the men and women in France resemble the two who have been sent to her she will be egregiously disappointed.

The bishop’s residence was chiefly occupied in his diocese where he devoted himself to the humble but useful task of pastoral instruction. Among his posthumous works are three catechisms, respectively, for beginners, for the instructed, and for the well-instructed. He composed also a manual for the worship of the Temple, the church hymn. His health continued uniformly good, and allowed the performance of all ministerial duties till the last year of his life, when he suffered under the stone. During intervals of ease he framed a commentary on the twenty-second psalm (the twenty-third of the Latin version) in vigour to any of his earlier compositions. On the 12th of April, 1704, he died at Paris, having passed his seventy-sixth year. Soon after the death of Bossuet his works were collected in twelve 4to. volumes, for which three posthumous writings were added, The History of M. de Sevigné, a complete collection of his works, which, we believe, is still unfinished, and extending to twenty quarto volumes.

Bossuet is esteemed by the Roman Catholics as the most eminent advocate of their creed; but whatever might be the influence which his controversial writings exercised at the time of their appearance, it is not upon these that his fame rests most securely at present. To give an exact catalogue of his works would far exceed our limits, and we shall confine ourselves to his chief productions. He held the post of master of the Jesuit college in Paris, after the death of M. de Paul Ferri, a Hueguenot minister at Metz; we find him, not long afterwards, vehemently engaged with Caffaro, a Theatine monk, in the reproduction of theatrical entertainments. Bourssart, a dramatic writer who enjoyed some contemporary reputation, was affected by scruples of conscience concerning the subjects to which his talents had been directed, and was relieved from his penitentury burthen by a letter which Father Caffaro addressed to him, and which may be found (if it is now to be found at all) printed at the foot of another paper of the same author, ‘Maximes sur la Comédie.’ But the most celebrated of Bossuet’s polemical works are his ‘Exposition de la Doctrine de l’Eglise Catholique sur les matières de Controversie’ (1671) and his ‘Histoire des Variations des Églises Protestant.’ This last work contains a comprehensive presentation of the marquis de Dangeau; and it is said that an accidental perusal of it greatly contributed to the conversion of the Maréchal de Turenne. It was circulated in MS. long before its publication, and attained the final state which it now exhibits by very gradual increments. Just as, according to Bossuet, on Tradition, and on the Authority of the Church, were wanting in the original sketch, and the Sorbonne, when applied to for their approbation, privately censured many parts which they conceived to be unsound.

Nine years elapsed and considerable alterations took place before it received the approval of the Holy See, and it is asserted that much of the doctrine which is pressed by others were declared to be scandalous and pernicious. Clement IX. positively refused to acknowledge it, but two briefs were issued in its behalf by Innocent XIth; one, Nov. 22nd, 1675; the other, July 12th, in the year following. The latter Brief, in which it is declared that it contained their doctrine, and an authority of our own time, which few of the Roman persuasion will be inclined to dispute (Mr. Charles Butler) has stated that ‘the Romish Church has but one opinion of it; in private and public, by the learned and the unlearned, it is equally acknowledged to be a full and faithful exhibition of the doctrine of their church.’ It has been translated into almost every European language, but unhappily the English version by the Abbé Montagu in 1672 bears a bad character. It is said that it has been very unsatisfactory, and rests, as Sir Walter Scott has shown, on very slight authority (Life of Dryden, Works, i. 339). In the Bodleian Library (Oxford) there is a translation published in London 1663, in the title page of which is the following note in the hand of Baron’s handwriting:— By Mr. Dryden, then only a poet, now a papist too; may be he was a papist before, but not known till of late. Wake, afterwards archbishop of Canterbury, and M. de St. Bastide, a French Protestant minister, are the most distinguished opponents of the points in dispute in which it is otherwise correct.

The ‘Exposition’ awakened much attention in France; and out of it arose a personal conference between Bossuet and M. de Claude, whom the Protestants considered to be their head, held in 1681, in the presence and at the request of the deputy of the Sorbonne; a meeting which they neither sought an excuse for the change of faith in which she had received to imitate her uncle. One of the chief questions debated was the authority by which Jesus Christ directed that his future church should be guided in case of dissensions. The debate was conducted with much regard to courtesy, but terminated, like all but a few debates, without any approach to conviction. Each party published its own account of the conference, and each claimed the victory, after representing the contest with so much effusion that they might be supposed to relate to wholly distinct occurrences. The language in which Bossuet expressed himself concerning this disagreement is singularly free from the bitterness which has too frequently distinguished controversy, and which has rendered the mutual hatred of the French Protestants since the Reformation. ‘It is not my intention,’ he says, ‘to accuse M. Claude of wilful misrepresentation. It is difficult to remember with precision the things which have been said, or the order in which they have been spoken. The mind often confounds with one another the expressions which are used and over- wards, and thus, without the slightest intentional abuse from it, truth is often disfigured.’ Bossuet was admitted to the academy in 1761, and his next great controversial work appeared in 1688. The first five books of his ‘Histoire des Révolutions des États protestants en France, and of the Progress of the Reformation in Germany; the sixth is devoted to a consideration of the sanction given by Luther and Melancthon to the adulterous marriage of the Landgrave of Hesse; the seventh and eight books contain the most remarkable ecclesiastical and political events of Henry VIII. and of Edward VI. and a continuation of that of Germany. The French Calvinists are discussed in book ix., and the assistance afforded to them by Queen Elizabeth, on the avowed principle that subjects might levy war against their king, under the pretence of religious difference (a doctrine which Bossuet asserts to have been inculcated by the reformers), forms the groundwork of book x. Book xi. treats of the Albigenses and other sects from the ninth to the twelfth centuries, who are usually esteemed precursors of the reformers. Books xii. and xiii. continue the Hueguenot history till the synod of Gap. The xiv gives an account of the dissensions at Dort, Charenton, and Geneva; and the xvth and last book endeavours to prove the divine authority and therefore the infallibility of the true church, and to show, by exhibiting the testimonies of the earliest writers, that to that title. Basnage, Jurieu, and Bishop Burnet may be mentioned among the chief opponents of this work, to a perusal of which, in conjunction with that of the ‘Exposition,’ Gibbon attributes his short-lived adherence to popery.

I saw, I applauded, I believed, and sincerely I fell by a noble hand.

No 301. [THE PENNY CYCLOPAEDIA.]
The fanciful project of a union between the Lutheran and Gallican churches occupied much of Bossuet's attention, and led to a correspondence of deep interest with Leibnitz. On matters of discipline the Bishop of Meaux pronounced, as he did in the French crown, that we should be induced to renounce our compromise, (concerning which the Council of Trent was his final appeal) he peremptorily declared that there could not be any compromise. The discussion lasted during ten years: it is replete with learning, but it proved utterly fruitless.

At the chamber of the clergy of France, convened in order to restrain the aggressions made by Innocent XII. on the régule: a right always claimed by the kings of that country, and almost always virtually tolerated by the Holy See, which vested in the French crown the revenues of any vacant bishopric, and the collation to simple benefices within their dominions. The Bishop of Meaux was selected to preach at the opening of this synod; and the four following articles, which were published as its declaration, registered by all the parliaments, and confirmed by a royal edict which forbade the appointment of any person as professor of theology who did not previously consent to preach the doctrines contained in them, are known to be his production. 'The last three,' Mr. Butler remarks, 'are still subjects of dispute; but the Pope's claim to temporal power by divine right has not perhaps at this time a single advocate.'

The first article declares that the power which Jesus Christ has given to St. Peter and his successors, vicars of Christ, relates only to spiritual things and those which concern the church, but not to things which are temporal; that in temporal, kings and princes are not subject to the ecclesiastical power, and cannot indirectly or directly be deprived by power of the keys, or their subjects discharged by it from the obedience which they owe to their sovereigns, on account of their succession.

The second article declares that the plenitude of the power which resides in the Holy See and the successors of St. Peter, in respect to spiritual concerns, does not derogate from what the Council of Constance has defined in its fourth and fifth sessions on the superior authority of General Councils.

The third article declares that the exercise of the Apostolical power of the Holy See should be governed by the canons which have been enacted by the Spirit of God, and are respected by all the Christian world; and that the rules, customs, and usages received by the kingdom and churches of France, and approved by the Holy See, should be inviolably preserved.

The fourth article declares, that in questions of faith, the Pope, like the Church, is infallible, and that his decisions extend over the universal church and each church in particular; but that, unless they have the consent of the church, they are not irrefragable. (Butler's Life of Bossuet, p. 165.)

Mr. Butler, in dispute with the nuns of Port Royal, relating to the five condemned propositions in Jansenius, Bossuet exerted himself to bring the fair enthusiasts to reason; and in like manner he opposed quietism and Mad. Guyon, till he inquired opposition from Fenelon and displeasure from Mad. de Maintenon. The correspondence with Fenelon is perhaps the single transaction in the life of Bossuet which his admirers would desire not to be remembered. Now that the question is almost as much forgotten, even among theologians, as if it had never existed, if any of the numerous writers who have taken up the subject of the birth, are ever opened by some curious inquirer, he lays them aside with pain. They create indeed a strong wish that Bossuet had imitated the meekness of his antagonist; and that he had not made the better cause, which he had the good fortune to plead, appear the worse by unseemly violence. He carefully watched the biblical labours of Père Simon, whom he accused of Socinianism. But it is chiefly by his sermons that he is now remembered; although perhaps those by which he attained most celebrity, the sermons delivered to the parishes of various cities, are ill cared for. They belong to a style of composition far too artistic and dramatic for our temperament, but especially adapted to the court of the grand monarque, in which religion, like everything else, was reduced to mere show. The doctrine of Bossuet with Madame de Maintenon, certainly encountered by her conventual seclusion, is among the most pathetic occurrences related in modern history; but few things are less likely to suggest Christian devotion than a show tricked out with ecclesiastical pomp, to exhibit, in the presence of the queen consort whom she had injured, the retirement of a royal mistress, disdained by her licentious and unfearing lover. Three volumes of the Benedictine publication of Bossuet's sermons, collected from the period of his ministry, are, for the most part, well known; but we will not forego the pleasure of transcribing one passage, which, eloquent as it is, is not unfairly selected, and which certainly has not lost any of its sublimity by the version of Mr. Butler, from which we have taken it, "Bible by the mouth of the mouth of the "clergy of France, convened in order to restrain the aggressions "made by Innocent XII. on the régule: a right always "claimed by the kings of that country, and almost always "ordinarily tolerated by the Holy See, which vested in the "French crown the revenues of any vacant bishopric, and the "collation to simple benefices within their dominions. The "Bishop of Meaux was selected to preach at the opening of "this synod; and the four following articles, which were "published as its declaration, registered by all the parliaments, "and confirmed by a royal edict which forbade the appoint- "ment of any person as professor of theology who did not "previously consent to preach the doctrines contained in "them, are known to be his production. "The last three," Mr. Butler remarks, "are still subjects of "dispute; but the Pope's claim to temporal power by divine "right has not perhaps at this time a single advocate."

The first article declares that the power which Jesus Christ has given to St. Peter and his successors, vicars of Christ, relates only to spiritual things and those which concern the church, but not to things which are temporal; that in temporal, kings and princes are not subject to the ecclesiastical power, and cannot indirectly or directly be deprived by power of the keys, or their subjects discharged by it from the obedience which they owe to their sovereigns, on account of their succession.

The second article declares that the plenitude of the power which resides in the Holy See and the successors of St. Peter, in respect to spiritual concerns, does not derogate from what the Council of Constance has defined in its fourth and fifth sessions on the superior authority of General Councils.

The third article declares that the exercise of the Apostolical power of the Holy See should be governed by the canons which have been enacted by the Spirit of God, and are respected by all the Christian world; and that the rules, customs, and usages received by the kingdom and churches of France, and approved by the Holy See, should be inviolably preserved.

The fourth article declares, that in questions of faith, the Pope, like the Church, is infallible, and that his decisions extend over the universal church and each church in particular; but that, unless they have the consent of the church, they are not irrefragable. (Butler's Life of Bossuet, p. 165.)

Bossuet, Charles, was born at Tartars, in the department of the Rhone and Loire, August 11, 1730. His parents were people of quality. He was educated by an uncle and partly by the college of Jesuits at Lyons. Happening to meet with the abbés of scientific men by Fontenelle at an early age, he was struck with the desire of making his own career resemble those of those he had read: and finding no one to advise him, he went to Fonte- nelle himself, who, though then ninety years of age, an- swered his letter, begged for a position that his young cor- ny was resolved to make the most of the present. This unbounded politeness (which is made a prophecy by his enemy) brought Bossuet to Paris, where he was cordially received by Fonte- nelle, and introduced to D'Alembert and Clairaut. The former became his friend and instructor, and so well versed the Bosse in mathematics, that D'Alembert and Clairaut were accustomed to send those who sought instruction in Bossuet, as Newton did to De Moivre. Camus, in 1759, procured for him the professorship of mathematics in the
school of engineers at Mézières, and in the same year he was made a corresponding member of the Academy of Sciences. He had previously presented a memoir containing new methods in the integral calculus.

But though Euler's talents and fame, for which he was long in high reputation, and procured for him the seats of Scuola, and lost his professorship by the revolution. He succeeded his friend Camus as member of the Academy of Sciences, and as examiner of the candidates for the artillery and engineers. He was one of the contributors to the Encyclopédie, and wrote the great practical and mathematical volumes. His articles are signed I.B. in that work. He gave, in 1772, a complete edition of Pascal, of whose writings he was a great admirer.

His treatise of Hydrodynamics, and his memoirs on that subject in the memoirs of the academy, contributed materially to the connexion between the theory and practice of that science. It is not that much has been done, but that little Bossut may claim an important part. In a memoir which gained the prize in 1736, he endeavoured to account for the powerful motion of a man's mean motion by the ship's position of a resisting medium.

When he lost all his places by the revolution he went into retirement, and wrote his sketch of the history of mathematics. [Bonnycastl.] The second edition of this treatise came out in 1796; it is a delicate sketch, but written, as it appears to us, in strong colouring. Delambre asserts that a misanthropic feeling, the consequence of his misfortunes, made him unjust towards his contemporaries; but at the same time it is the only compendium, or even division of the subject; it is the most delightful of the porches which distinguished him. Perhaps he copied his early sketches on the part of the imaginary revenge on the destruction of himself in the third person [D'Alembert], the tone of which is curiously like the one in the article cited.

Bossut was originally intended for the church, and was indeed an abbé, by which title he bore until the abolition of clerical distinctions. He died Jan. 14, 1814. The preceding account is entirely (as to facts) from Delambre's Life in the Memoirs of the Institute for 1816. We do not know of any other account whatsoever.

**BOSTANJ, from Bostan, a garden.** The class of men who now continue in Turkey, who perform a curious variety of functions, and whose head or chief (Bostan-Bashi) is one of the great dignities of the Turkish empire, seem originally to have been nothing more than the sultan's gardeners, attached to the imperial residence or seraglio of Constantinople. They still work as gardeners in the sultan's pleasure-grounds at Constantinople and on the Bosporus, but the more conscious of their duties are, to mount guard in the seraglio, to row the sultan's barge, to row the caiques of all the officers of the palace, to follow those great men, on foot, when they ride on business through the city, and to attend to the execution of the numerous orders of the bostan-bashi. They were aggregated with the janissaries, with whom they formerly did military duty in the field, but the bostanji were not suppressed at the sanguinary dissolution of 1808. They are erected, and are still the dignities of the Ottoman court.

When the Ottoman Court was in its splendour, the bostanji corps amounted to 2500 men, who were divided into oras, or companies, like the janissaries. The distinctive part of their costume was an enormous bonnet, or hat, called the bostan-bashi.

The bostan-bashi, who has the rank of a pasha, is governor of the seraglio and the other imperial residences. He is inspector-general of the woods and forests in the neighbourhood of Constantinople. The shores of the Bosporus are territories from the mouth of the Black Sea to the Straits of the Dardanelles, under his jurisdiction, and formerly no person whatsoever could build or even repair a house on those coasts without his permission. For this license fees were exacted, which were generally fixed in the most arbitrary manner. Whenever the sultan makes an excursion by water (and in the fine seasons he rarely travels in any other way) the bostan-bashi stands or sits behind him, and steers the magnificent barge, which is rowed by the bostanji. This brings him into frequent contact and conversation with the sovereign, who never traverses the Bosporus, except for seraglio purposes, in the absence of the bostan-bashi is almost as great a man as the kialaragha (chief of the black eunuchs) or the scelurca (the sultan's word bearer). He used also to exercise the functions of provost-master-general, presiding at the bow-stringing of the Turkish gondla when the vessels of state are launched, and superintending the tortures applied in the prison of that palace, to force from obstinate ministers and government functionaries the confession of their guilt and the disclosure of their property; which latter was always confined to the sultan. A comment on this is, that the imperial barges used rarely to be seen abroad before dawn; 'no doubt,' says D'Ohsouan, with much naifeté, 'on account of the sensation produced by the presence of the supreme minister of executions.'

Another very lucrative duty attached to this composite office was the inspection of the trade in wine, and lime, and mortar for building, carried on in the capital and its vicinity.

Of late years, however, since Sultan Mahmoud has become a reformer, both the money-getting branches of the office, and the military function of the bostan-bashi, have been considerably abridged; and in time we may hope to see him as harmless a character as the commander of a royal yacht or a court chamberlain in Christendom.

**BOSTON (Lincolnshire), a sea port, bor., and m., on the Witham, in the division of Lindsey, in the county of Lincoln.** This division of the county is, as is now seen in the parts of Kesteven and Holland, which form the S. division of the county, and is one of the polling-places for the election of knights of the shire. 'A small addition is made to the par. by the Boundary Act to constitute the new borough.' (Corp. Rep.) These additions make the whole return the number of the inhabitants of the town, and the feoffment of Skirbeck-Quarter. Boston has sent two members to parliament since the 37th Henry VIII., when it was first made a free borough. It sent members to three councils in the reign of Edward III.

**Origin, History, Antiquities.** The original and ancient history of Boston is obscure. The great canal or drain, called the Car-dyke, which extends forty miles in length from the Welland, in the S. of the county, near Lincoln, to the Witham, is generally attributed to the Romans. It is stated on various authorities that Roman coins have been found in the vicinity of Boston, which is a continuance of the drain from Lincoln to the Trent at Torksey, and appears to have been the work of the same hands. The Westhicle, another ancient drain in the parts of Holland, carries off the upland waters, by its communication with the Welland at Spalding. The old sea dyke is a great barrier erected along the coast, in order to render the drains safe from the influx of the ocean. (Dugdale's History of Embanking and Draining.)

The marshes and fens which had been hitherto, or at least for some previous centuries, extensive lakes of stagnant water, were now drained, and furnished large tracts of rich land, suitable for every agricultural purpose. The country was intersected with canals, and guarded from the future inroads of the sea by stupendous works of embankment, erected by orders of the provincial civil and Roman generals and commanders. (Noble's Gazetteer of Lincolnshire.)

Several of the great works here alluded to are said to have been performed in Nero's time, and during the procuratorship of Catus Decianus. (The county of Lincoln was the Roman province of Plantica, Caesarivsia, and there were several military stations in different parts of the county. Whether Boston was one of them is a disputed point among antiquaries. By one authority it is considered, with a great degree of plausibility, that the town is mentioned in the Itinerarium of Dr. William Stukeley, and his 'account of Richard of Cirencester, may be consulted with satisfaction. Three of the principal Roman roads were carried through Lincolnshire, but none of them passed through Boston, and it..."
is by no means certain that there was a branch road to it. Lincolnshire was a part of the kingdom of Mercia during the heptarchy, and the Saxон Chronicle informs us that 'St. Botolph built a monastery here, a.d. 654,' which existed till the county was ravaged by the Danes, a.d. 870. Bede says that St. Botolph had a monastery at Icanhoe. Leofric, king of Mercia, founded a church on this site, the spot where the monastery was built. From the testimony of many antiquaries, Boston appears to have been the antient Icanhoe, and the site of St. Botolph's monastery. Some topographers are satisfied with concluding that Boston is a corruption of Botolph's name. Stukeley says, 'Icanhoe, Icanhoe, or as it was commonly called, according to Dug-dale, Wенно, is supposed to have been the antient name of Boston; and also that it was the last bounds northwards of the Ican; he therefore concludes its old name was Icanhoe. (Thompson's Collections for a History of Boston.)

Boston not being mentioned in 'Domesday Book,' Mr. P. Thompson supposes that it was included with Skirbeck, for 'at the present day, it is very nearly surrounded by Skirbeck, and appears to occupy the very centre of the land which, in the Domesday Survey, was returned as belonging to that parish.'

Modern History.—Little worthy of notice is recorded of Boston during the early part of the Norman government. In the year 1204 it was a wealthy town; for when the goods and chattels of a fifteenth part of land and goods, at the several ports of England, the merchants of Boston paid 780l.; London paid 830l. (Madox's Hist. of the Exchequer.) London paid the largest sum of any port, and Boston was the second, in amount of goods. A great fair was held at Boston; at what date established is unknown, but it is on record that it was resorted to from Norwich, Bridlington, and Craven during the thirteenth century. Articles of dress, wine, and groceries formed part of its commerce. In 1281 part of Boston was destroyed by fire; and in 1396 a great part of the town and the surrounding district suffered from an inundation. This flood is probably the same as that mentioned in Stowe's Chronicle, p. 229. 'An intolerable number of men, women, and children were overwhelmed with the waters, though good churches and other buildings in the town or city which was a place of great resort, whereof was destroyed. It was one of the towns, appointed by the statute of staple (27th Edward III.), where the staple of 'wools, leather, woollens, and lead,' should be held. A staple town is described by Weever as a 'place to which, by authority and privilege, wools, hides, wine, corn, and other foreign merchandise are conveyed to be sold; or, it is a town or city whither the merchants of England, by command, order, or commandment, did carry their lead, tin, or other home produce for sale to foreign merchants. Merchants from the commercial towns of the continent resided at Boston during this early period, and it is probable that both the above characteristics of a staple town were combined in it. It also ranked high as one of the sea-ports of the kingdom, its situation at the mouth of the Witham giving it advantages equal to those of any other port on the eastern coast. The advantages which Boston possessed as a place of trade, brought over the merchants of the Hanseatic league, who established their guild here. In 1359 Edward III. assessed eighty members of this shipmoney. At the beginning of the reign of Henry IV. the town, by Act of Parliament, was given to the Bishop of Lincoln, and to the Bishop of Norwich, and in 1377 it was sold to the Bishop of Lincoln, who sold it to the town; the sale was confirmed by Act of Parliament in 1379. In the same year the town was incorporated, and the freedom was granted to every freeman of the town. (Archaeologia, and Thompson's Collections.)

About 1470 the town of Boston received a check in consequence of some dispute, when 'one Humphrey Littleby, Mayor of Boston, killed one of the King's officers, and was hanged, but the town was allowed to be the same as the Hanseatic merchants'; this caused the Esterlings to quit Boston, and syns the town sore decayed. (Leland's Itinerary, vol. vii.) At the time when Leland wrote his account of Boston (1531), the commonalty of the town seems to have been in the 'great and famous fair,' and of the 'old glory and riches that it had,' as matters of history, and says, 'the staple and stilel country, houses yet there remayne, but the stilel is little or nothing at all occupied.' The stilel-house was the ancient custom-house, and the merchants of the steelyard were so called, from the circumstances of their trading almost entirely by weight, and using the steelyard as their weighing apparatus. Boston was still further reduced by the dissolution of the monasteries by Henry VIII. Some amendments were made by Henry in granting the town a charter of incorporation; it was thus made a free borough; the admiral court was established, and the manor, the site of which the monastery was built. From the charter, granted in the 37th of Henry VIII., the borough is at present chiefly governed. Philip and Mary, in the first year of their reign, endowed the corporation with a rich grant of lands and messuages, to assist in maintaining the bridge and port, for supporting school in the town, for finding two presbyters for the celebration of divine worship in the parish church, and for the maintenance of four beadsmen to pray there for ever for the good and prosperous state of the queen while living. This valuable endowment, so important, and so liberal, was used by the original charter, the Lord Rolle's, consisted of fifty messuages, ten gardens, and 227 acres of land, situated immediately near Boston. The late municipal inquiry however shows the property to be 511 acres, 1 rood, and 21 perches of land, and some houses, and yields a yearly rent of 2145l. 16s. 6d.' This difference is accounted for partly by a previous assessment of the measurements, and partly by the circumstance of many allotments having been made to the corporation under Inclosure Acts. (Corporation Reports.)

During the reign of Elizabeth the port continued to decline; the merchants no longer visited the town, and the mayor and burgesses a charter of admiralty, giving them power to levy certain duties on ships entering the 'Norman Deeps.' In 1571 Boston and the surrounding district suffered much from a violent tempest, an account of which is given by Holinshed. During the Commonwealth the town was again visited in 1644. In 1643, Boston was strongly fortified for the king and parliament, but it was soon crowded with the parliamentary soldiery, and made the head-quarters of Cromwell's army. The principal men of the district favoured the interests of the Royalists. In June 1643, Colonel Cavendish defeated the parliamentary troops at Donington, near Boston, and soon after Cromwell removed his quarters to Sleaford. On the restoration of Charles II. a warrant was issued, by which some of the officers of the town and district were exempt from the payment of the poll tax, which had shown in the cause of Cromwell. About the middle of the eighteenth century, the commerce of Boston fell into still greater decay, 'through the ruinous state into which the river and haven had fallen, in consequence of neglect and mismanagement, and from errors committed in the execution of works of drainage.' (Thompson.)

Ecclesiastical History.—Dr. Stukeley supposes that the monastery of St. Botolph stood 'on the south of the present church; he saw vast stone walls dug up there, and a plain stone cross of uncertain date.' The site of the church was once held in consequence of neglect and mismanagement, and from errors committed in the execution of works of drainage.' (Thompson.)

The Augustinian friars had a priory at Boston, founded in 1301, and various small grants of land from pious individuals, and from Henry IV.; and their order was patronized by Thomas Earl of Rutland. Not a vestige of the old priory remains, except the site of the church, which, it is supposed, was the site of the mansion house, and is visible on the west side of the town, near the old church; the priory church is said to have had only meretale objects in view. The guild of Corpus Christi is thought to have been a religious one; at the Dissolution it was called a college. The guild of the woolmen was highly esteemed for its splendid magnificence, and in its purposes partly religious. Its balle is preserved by the corporation for their judicial proceedings, public dinners, &c. The council-chamber contains a portrait of Sir Joseph Banks, by Lawrence, which was presented to the city by the corporation on his election to the office of recorder of Boston.
in 1809. The gulf of St. Peter and St. Paul was a religious establishment, and had a chapel, or an altar in the parish church. St. George's gulf was a trading community, and the church of St. George of that name is still known. The possessions of all these guls were vested in the corporation of Boston when the religious houses were dissolved.

The first stone of the present church of St. Botolph was laid in 1090. The existence of a church at Boston is recorded so early as 1090. The vicarage is now in the gift of the corporation, and its annual value is 360l. (Ecclesiastical Reports), which is paid out of the grant of Philip and Mary. This church is one of the largest parish churches without a tower in the kingdom. It is 245 feet long and 98 feet wide within the walls. Its tower is one of the loftiest in the kingdom, being 300 feet high, and ascended by 365 steps. The tower, which is visible at sea for more than forty miles, is surmounted by an elegant octagonal lantern, which is a guide to mariners on entering the Bos-
ton and Ipswich Roads. This lantern, says Rickman, is panelled throughout, and each side is pierced with a large two-light window, having double transoms; this compos-
sition gives to the upper part of the steeple a richness and lightness scarcely equalled in the kingdom. The church is principally decorated, and the tower perpendicular, both excellent in their kind. The chancel is partly de-
corated and partly perpendicular, and there is a good south porch. The tower, which is one of the finest compositions of the perpendicular style, is a complete arrangement of pointed arches, vaults and buttresses, and is one of the most beautiful objects in which the window is so large as nearly to occupy the whole face of the tower.' (Rickman on Gothic Architecture, p. 231.)

The altar-piece, set up in 1741, is in four compart-
ments, and represents the Crucifixion, the Annuncia-
tion, the Virgin in the Temple, and the Ascension. It is a copy from the celebrated one by Rubens in the great church at Antwerp. In a chamber over the south door is the parish library, which contains several hundred volumes, among which are many valuable and scarce works on divinity and Antiquities of Great Britain. (Britton on Architectural Antiquities of Great Britain.)

The chapel of ease, which was erected by subscription in 1822, is a perpetual curacy in the gift of the subscribers, for fifteen years from the time of its erection; after which time the corporation becomes its patrons. There was formerly a church called St. John's, which was taken down nearly 200 years ago; its burying-ground is still used as a place of interment. The dissenting places of worship in Boston are for Independents, Wesleyan and Primitive Methodists, General Baptists, and Quakers. Most of these denominations have their own Sunday-schools, which altogether educate nearly a thousand chil-
dren.

The Haven.—The history of the Witham, and the harbours and the influence of the drainage of the fens upon them, abound with interesting details. The changes which have taken place from local circumstances appear to have greatly affected the prosperity of the town. The fall of the Witham from Lincoln to the sea, Sir William Dugdale says, 'the descent of the Witham is so little, that the water, having a slow passage, cannot keep it wide and deep enough for navigation or for draining the adjoining marshes. It appears, notwithstanding, that during the commercial prosperity of Boston, ships of a heavy burden could get up to the town, and loaded and unloaded in the river and was paid to the removal of obstructions, and to the cleansing of the river. In 1751 it was stated that thirty years before a ship of 500 tons could get up to Boston; but that then even a small sloop of forty or fifty tons, drawing only six feet of water, could not sail to or from the town except at a spring-tide. One of the causes of this decay of the haven is attributed to the diversion of the waters of the neighbouring fens from their ancient entrance into the Witham, above Boston, which had formerly discharged themselves in such large quantities into the sea as to be wholesome. The amount of the ne-
ighbouring fens have materially increased its internal means of
wealth, by enabling it to bring into its market immense quantities of agricultural produce; while the conveyance of this product to London and other places gives occupa-
tion to its shipping. There are some factories at Boston for sail-cloth, canvas, and sack; there are a few iron and brass foundries. By means of the Witham and the canals connected with it, Boston has a navigable com-
and embanking have also been obtained. The most favour-
able results have followed these measures, which began to be visible as soon as the larger works were completed. The town of Boston has been chiefly governed by the charter of Henry VIII., already mentioned. The title of the corporation was, 'The Mayor and Burgesses of the borough of Boston;' the officers being a mayor, recorder, deputy-recorder, twelve aldermen, six town clerks, a sheriff, six assessors, twelve constables, judge of the court of admiralty, gaoler, and subordinates connected either with the borough or port. Freeman were created by birth, servitude, gift, and purchase. The number of resident freemen was about four hundred and eighty; but of non-residents, about four. Under the new Munici-
pal Act, it is placed in the second moiety of the boroughs which are to have a commission of the peace, to be divided into three wards, to have six aldermen, eighteen common-
council men, and the other officers provided in the Act, by which the government of the borough will be materially changed. The court of quarter-sessions is held by the mayor, deputy-recorder, and other magistrates. There is a court of reviews for the recovery of small debts, which seems to be beneficial. The borough gaol is very inadequate for that classification of the prisoners which the law re-
quires, as 'there is no provision for a separate and separate,
un tried from the convicted,' and the young offender has to associate, day and night, with the hardened culprit. The number of prisoners committed to this gaol was, in 1830, 308; in 1831, 290; in 1832, 269. For details respecting the number of inmates of the two houses, reference is to the 'Corporation Reports.' The town is but indifferently supplied with water; attempts have been made to supply this deficiency by boring, but they have not been success-
ful. In 1826, a depth of 600 feet was attained without attaining water, and the same result occurred in 1827. In dry seasons, the inhabitants have to buy water. It is well supplied with coal by the coasting vessels from Sunder-
land, Newcastle, &c. Its foreign trade is chiefly with the Baltic, whence it imports hemp, iron, timber, and tar; it exports coal, and particularly in the years 1810 and 1812, one-third of the whole quantity of oats which arrived in the port of London, were shipped from Boston.

The borough and parish of Boston contains 7923 acres 39 poles. Its pop., in 1801, was 5926; in 1811, 8160; in 1821, 10,373; in 1831, 11,240; of whom 6064 were males, and 6146 females. Under its extended boundary by the Reform Act, the pop. of the borough is 12,818.

Families employed in agriculture, 149; in trade, manufac-
tures, &c., 1254; not comprised in the above, 1104. Annual income of the tradesmen and labourers, 9706l. 17s. 6d. Assessed taxes, for years ending 5th of April, 1829, 3064l. 13s. 6d.; 1830, 2972l. 1s. 6d.; 1831, 2952l. 14s. 7d.; 1832, 3065l. 4s. 6d.

Parochial assessments, for years ending 25th of March, 1821, 8463l. 14s.; 1821, 8810l. 18s. 6d.; 1831, 8451l. 9s.; 1832, 9091l. 19s. 6d.; 1833, 8578l. 19s.

Number of houses, in 1833 (as charged to the house-
duty), 104; and under 20l. rent, 310; and over 40l., 161; and upwards, 79. (Municipal Report.)

Public Buildings, Trade, &c.—The town on the E. side of the river consists of one long street, called Bargegate, the market-place, and some minor streets; there is another long street on the W. side of the river, called High-street. The market-place is spacious, and very suitable for the well-at-
tended fairs and markets which are held here. The mar-
ted days are Wednesdays and Saturdays, and are particularly noted for sea and river fish. Immense numbers of sheep and horned cattle are sold at the markets, and there are convenient areas in several adjacent parts of the town, where the cattle are folded, and kept during the time of sale. As an out-post in the centre of a very fertile agri-
tural district, equally adapted to pasture and corn, and with a breed of cattle of a very fine description—being remarkably large and famed for their symmetry—Boston is favoured above other towns on the coast, being the market for the whole of the ne-
ighbouring fens have materially increased its internal means of
wealth, by enabling it to bring into its market immense quantities of agricultural produce; while the conveyance of this produce to London and other places gives occupa-
tion to its shipping. There are some factories at Boston for sail-cloth, canvas, and sack; there are a few iron and brass foundries. By means of the Witham and the canals connected with it, Boston has a navigable com-

communication with Lincoln, Gainsborough, Nottingham, and Derby, and by them with all the inland towns. The new market-house, erected in 1819, includes a convenient corn-market; there are also butler, poultry, fish, and stock-markets. The building is of brick and stone, and which altogether forms a very handsome edifice. E. of the haven, and near the iron bridge. This bridge, which is of a single arch, and cast-iron, is an elegant structure; it was commenced in 1802, and opened for carriages in 1807. Its curvature is so slight that the road over it is nearly horizontal. Its dimensions are 86 ft. 6 in. span, and 39 ft. broad; it was built at the expense of the corporation, and cost, including the purchase of buildings, 22,000l. The petty sessions for thewapentakes of Kirkton and Skirbeck are held in the building. The town-hall, which is a substantial building, near the quay; it was taken down and rebuilt in its present shape about a century ago. The poor-house is in St. John’s Row; it was built about the year 1730. ‘The corporation have no share in its management.’ (Corporation.) It has 47 inmates, and a rate of 6d. a year is levied for each in 1819. It is supported by subscription; the patients are generally visited at their houses. The town is lighted with gas. There are two subscription libraries and two news-rooms. The amusements of the theatre are not so well encouraged as formerly.

Charities.—A grammar-school was provided for by the rich grant of Philip and Mary in 1554. The building was erected by the mayor and burgesses in 1567; it is in the mart-yard, so called from the great annual fair having been held in it. The school-room is described as large, convenient, and having a high wall round the play-ground. The corporation have the appointment of the schoolmaster, to whom they pay 220l. per annum. A portion of this sum is allowed during the approbation and pleasure of the corporate body. The corporation lately expended the sum of 1800l. in providing a house for the master, who pays them a rent of 40l. a year; he also pays an usher 60l. a year. An annual sum of 80l. is paid by the corporation to the late master. The school was under his charge thirty-five years, and the number of pupils increased so as to have been 200. The pension was given him to induce him to resign his office, and a most desirable change has been produced; the number of pupils now being forty, nearly all of whom are free boys. The usual education of a grammar-school is free to the children of every inhabitant of the parish; for a commercial education, a guinea a quarter is charged. The children of members of the Established Church are taught its catechism, those of Dissenters are not. (Further particulars in Carlisle’s Endowed Schools, and in the Corporation’s Report of 1815.) The school was established by a bequest of 100l. a year, 1713, by subscriptions, and donations, for the education of boys and girls. The master and mistress have 100l. a year. The number of children in the school is 50 boys and 90 girls. The National and British Schools were begun in this town in 1803. In 1813 each of these schools had 120p. a week is paid by the children. The National School contains 94 boys and 80 girls. The British or Public School, 100 boys and 70 girls. There is also an infant school, which takes charge of 120 children. Laughton’s Charitable School was established by a gentleman of that name in 1707; it was intended for the poorest freemen’s sons, and for placing out a certain number of them as apprentices every year. There have been several benefactors to this school since its founder; in 1819 its annual income was 1111l. 16s. 8d. The number of pupils is thirty-five; the sum of money given to them as an apprentice-fees, on their attaining the age of fourteen, varies according to the state of the funds at the time they leave the school; it is generally 10l. Names of other charities sufficiently explain their object: they are a Bishopric Sch. for the poor of Carlisle, a Dorcay Sch., the Poor of Carlisle, Apprentices’ Charities.

Two interesting remains of antiquity have yet to be noticed,—the Kyne Tower, and the Hussey Tower. The former is situated about two m. E. of Boston; it is of brick, quadrangular, and without a staircase, having a single angle, containing a flight of about twenty steps. It is said to have been a baronial residence of the Earls of Richmond; it passed into the Rochford family, from thence into that of the Kynes, and finally escheated to the crown, in consequence of some political transgression of its owner. It is now the property of the Dean and Chapter of Westminster.

The Hussey Tower is situated in the town, near St. John’s Row, and is the remains of a baronial residence of Lord Hussey. From what is now standing no idea can be formed of the original form or extent of this building. (Thompson’s Collections, p. 366.) (Works of Boston; Communications from Boston, Spalding, &c.)

BOSTON. The capital of the state of Massachusetts, is situated in 42° 21' N. lat. and 71° 4’ W. long., at the bottom of Massachusetts Bay, on a peninsula above two miles square, and in not more than one mile breadth. A narrow isthmus by which the peninsula is joined to the main land is called Boston neck, and the arm of the sea which washes the peninsula on its N. and W. sides, is named Charles River.

The town was first mentioned about the year 1630, by the settlers established at Charlestown, on the shore of Massachusetts Bay, contiguous to Boston peninsula. The name was given in compliment to the Rev. John Cotton, who had been a deacon at Boston in Lincolnshire, from which place he was driven by the religious persecutions, while his original settlement of the New England Colonies must be ascribed.

The early settlers, themselves, the victims of persecution for conscience’ sake, seem to have entertained no enlarged ideas of religious freedom. They claimed, and by their voluntary expatriation took effectual means for securing, the safety, liberty, and property of religion on their own hands, but they did not learn the justice of tolerating religious systems different from their own. At the very first court of election held in the colony, a law was passed enacting that ‘none should thereafter be admitted freemen, or be entitled to vote at any election, who was not of the established church, or being chosen magistrates, or even of serving as jurymen, but such as had been or should hereafter be received into the church as members.’ It would appear from this, that ‘the pilgrim fathers’ did not indeed disapprove of religious persecution but were against being made victims of it.

The scheme of taxing America by the British parliament, met no where with a more decided opposition than in Boston. The Stamp Act, which received the royal assent on the 22nd of March, 1765, was to come into operation on the 1st of November following. It was, however, on the 10th of August following that serious riots took place in the streets of Boston; the building intended for the reception of the stamps was pulled down, and the lieutenant-governor was forced to quit the city. From that time the inhabitants of Boston took on all occasions a prominent part in the resistance to the taxation of the States. One of the most memorable events that accompanied this dispute, was the destruction in Boston harbour of the eagles of tea which, burtrenched with an exception to the duties of the East India Company, and shipped to the East India Company. On the arrival of these consignments in December, 1773, the inhabitants of Boston held meetings in their town-hall, to consider of means for opposing the introduction of the tea, and negotiations to that effect were entered into with the British government. Finding there was little probability of these negotiations coming to a satisfactory issue, a party of men, about fifty in number, disguised as Mohawk Indians, proceeded late in the evening on board the tea ships then lying at the wharf, and emptied the contents of every chest into the sea; it was never discovered who the individuals were by whom this daring act was committed. As one of its consequences, the British parliament passed the Act known as the ‘Boston Port Bill,’ by which the landing and shipping of goods at the town or harbour of Boston were made illegal, not only for the full duration of the war, but also for the East India Company, and until the king in council should be satisfied of the re-establishment of order in the town. By a subsequent Act of the same session (1744), the charter of the province was in effect subtracted, by vesting in the crown the right of appointing all the judges of the province, and by a third Act, the governor was invested with power to send for trial to England all persons accused of offences against the revenue, or of rioting in the colony.

Early in the revolutionary war Boston became the scene of considerable hostilities. In 1775, the troops of General Howe, having made this town their head-quarters, were blockaded by the American troops under General Putnam, who occupied the heights of Dorchester south of the town, and an eminence called Bunker’s Hill on the north, separated from the peninsula by Charles River. In June, 1775, the English attacked this last-named post, and after having
been twice driven back, succeeded in dialogueing their opponents, but with a loss of 1100 killed and wounded, including eighty-nine officers. In the heat of the action, Charles- town was, in a great measure, on fire. Boston, containing several hundred houses, was set on fire by the British and entirely consumed. In the following month General Washington, then newly appointed commander-in-chief of the American forces, arrived before Boston, which public buildings of the State at the fine season of the year. He then commenced offensive operations, and having with a considerable force obtained possession of the heights of Dorchester, and thrown up some works by which the town was commanded, the British general was forced to evacuate the town, which Washington entered on the 17th March, 1776.

With the exception of a spot in the south-western part of the city, called the Common, and containing about seventy-five acres, the whole of the peninsula is occupied by buildings. The city is connected with the mainland by six bridges—Charles River Bridge, leading from Charlestown to the north, is 1563 feet long; West Boston Bridge, leading to Cambridge port on the west, is 7810 feet long; between these two is Canal Bridge connected with Lechmere point, 2756 feet long; two bridges unite the peninsula to a suburb on the main land, called South Boston; and the sixth connection with the main land is by means of a mill-dam, which serves also for a bridge on the south-west side of the city: this mill-dam is nearly two miles long, and 50 feet wide.

All the chief harbours are formed by numerous small islands, on one of which, at the entrance, is a light-house sixty-five feet high with a revolving light. The islands, and the numerous shoals, render it necessary for vessels to take on board a pilot. There is in general sufficient depth of water within the bay all times of tide, to enable the largest vessels to reach the town where they are moored alongside wharfs, of which there are about sixty, some of them of extensive dimensions: one, called 'Long Wharf,' is 530 yards long; and another, called 'Central Wharf,' is more than 400 yards long and wide, with a row of lofty brick warehouses along its entire length: vessels lie here in perfect safety from whatever quarter the wind may blow. The entrance to the harbour is so narrow as scarcely to admit two ships abreast; it is defended by forts constructed on several of the islands, close to which ships must pass.

In the oldest part of the town, those streets which remain as they were originally planned, are narrow and crooked, the houses are of small dimensions, and plainly built of wood. The parts wherein they are planned, 1149.

The imports consist principally of woolen, cotton, linen, and silk manufactures, sugar, coffee, indigo, hemp, and flax. The value of iron annually imported amounts to 15,000 tons. The exports consist of fish and fish oils, salted meat, flour, soap, and candles, with a small quantity of the cotton manufactures of the country. The amount of tonnage frequenting the port from foreign places during the three years from 1829 to 1831 was:

nearly the whole of which was under the American flag; the amount of cotton duties paid at the port in 1831 was 4,527,599 dollars, or 1,089,081l. sterling.

Boston contained in October, 1833, twenty-five banks, with an aggregate capital of upwards of sixteen millions of dollars. The highest rate of dividend made by any of these establishments is seven per cent. per annum, and the lowest is five per cent. per annum; the greatest number divide six per cent. annually. [For further particulars respecting the banks of Boston see the articles Bank and Banking, vol. iii. page 388.] There are also twenty-nine companies incorporated for fire and marine insurances, the aggregate of whose capital is 1,000,000 dollars.

The trade of Boston is facilitated by means of the Middlesex canal, which was completed in 1806, and runs from Boston harbour to Merrimack river at Chelmsford, thus opening a cheap communication with the central part of New Hampshire. More than 120 stage-coaches leave Boston, and as many arrive daily with passengers to and from all parts of the Union.

The 'General Court of Massachusetts,' consisting of a senate and house of representatives, the former having forty and the latter an infinite number, sometimes exceeding 500 members, meet at Boston twice in every year, in January and May. The supreme courts of judicature for the state are likewise held in the city. There is also a court consisting of three justices, styled the 'police court' for the city of those cases to which a municipal court of one judge, who has cognizance of all crimes, not capital, committed within the city and the county of Suffolk, in which it stands.

The value of imports and exports from and to foreign countries during the same years, was as follows:

Boston contains several literary institutions. Among these the Athenæum has a library of 25,000 volumes, and a museum with a large collection of rare coins and medals. The Massachusetts Historical Society, the Boston Library Society, and the Columbian Library have likewise good collections. New England, for instance, is the most extensive in the United States. There are, besides, a Gallery of Fine Arts, an Academy of Arts and Sciences, and a Mechanics Institution in the city, which are liberally supported.

The Massachusetts General Hospital, which was founded in 1818, has been handsomely endowed by the joint contribution of the state and of individuals. An Hospital for the Insane and a House of Industry are supported by the inhabitants of the city. The institution for the Education of the Blind and the Aborigines, in the neighborhood of the city, is a worthy effort. Its establishment is of recent formation, having commenced in 1833 with slender means, and undertaking at first the instruction of only six poor blind children. The success attending this first experiment proved so satisfactory that within six months the state legislature made an appropriation of 6000 dollars per annum to the institution, upon the condition that it should receive and educate, free of cost, twenty poor blind persons from the state of Massachusetts. A private individual, Mr. Perkins, gave up his own residence for the best houses in the city, for the purposes of the institution, on condition that the sum of 50,000 dollars should be contributed for its support by other individuals, a condition which was satisfied within one month. At the date of the last annual report (1830) the institution contains about twenty students and twenty male scholars, being all that the building could contain.

The studies of the children comprise arithmetic, grammar, geography, history, the French and Latin languages, to which may be added the study of music, both vocal and instrumental, as a temperance and training to enabling the pupils to obtain a livelihood, either as teachers or organists. One class is instructed in natural philosophy, and several pupils are studying algebra and astronomy with success. The children are also taught manual labor in the grounds, knitting and weaving, and can make mattresses, cushions, door-mats, and baskets: these occupations being considered advantageous, not only as the means of earning their support, but also for imparting a facility of exercising the physical powers of the pupils. The point in which the managers of the institution have been most successful is the art of printing in raised characters, in which their performances are said to excel those of any institution in Europe. A specimen of this method of printing, which fully justifies the confidence that the public have in the institution, containing an epitome of Lindley Murray's English Grammar, the cost of which in sheets is little more than four shillings sterling. The institution is provided with a printing-press, and much of the work, such as laying on the type, is performed by the pupils themselves. They have also a perfect assortment of the type required for printing in raised characters, and have already printed, besides the Grammar, the Acts of the Apostles; a child's book of first lessons, and a hymn-book. In June, 1835, they were engaged in printing a spelling-book, and were preparing for press the whole of the New Testament. The superiority of the books printed in raised letters at this Boston press over others that we have seen consists in the clearness and perfect formation of the letters, and regards the spaces which they occupy. In the books printed at Paris there are on a page of eight inches by seven, or fifty-six square inches, 408 letters; at Edinburgh by the improved method 590 letters are included in that space, while at Boston, a page of equal dimensions is made to contain 787 letters, being nearly double the contents of the Paris page. By being careful in the operation of working off, a thinner paper is employed, and altogether the quantity of reading matter in the Boston volumes is equal to three times that contained in like bulks of French volumes.

The number of public schools of various descriptions in Boston in January, 1830, was eighty, and the number of scholars in attendance 7430. Of these institutions nine were grammar-schools, nine writing-schools, one Latin and one English high school for boys, fifty-seven primary schools for children between four and seven years of age, two schools in the House of Industry, and one school dedicated 'the House of Reformation.' The expenses incurred for the support of these schools in 1829 was 65,500 dollars. The whole number of schools in the city, public and private, was 235, and the number of pupils in attendance 11,448. The whole expense for tuition, books, &c. was 196,829 dollars. Harvard University, the best endowed institution of the kind in America, is at Cambridge, three miles N.W. of Boston.

The provident institution for saving in the city of Boston possessed on the 15th July, 1834, deposits from 11,516 depositors, amounting to 1,790,000 dollars (354,000). There is a similar institution for receiving the savings of seamen, but no statement has been given respecting its financial condition.

The first Anglo-American newspaper, entitled 'The Boston News-Letter,' was published in this city on the 24th of April, 1704; it continued to be published during seventy-four years, and for fifteen years of that period was the only newspaper printed in the English colonies in America. The second of these papers in point of time was likewise printed in Boston. The third Boston paper, first published in 1731, was printed by James the brother of Benjamin Franklin, in whose name the publication was for some time carried on, in consequence of some difficulties in which James Franklin was involved with the government. Some of the earliest writings of Franklin were given to the world in the columns of this paper, which was called 'The New England Courant.' The number of newspapers printed in Boston in 1834 was forty-two, of which nine were published daily, seven twice a week, and twenty-six weekly. The first daily paper was published in 1813.

Several periodical works are published in Boston. Among these may be mentioned, 'The North American Review' (Quarterly); Woodbridge's 'Annals of Education;' the 'Christian Examiner,' founded in 1813, under the title of 'Christian Advocate,' by which name it is changed to its present title in 1824, published once in two months; and 'The American Almanac and Companion,' a valuable work conducted on the model of the British Almanac and Companion. The 'Edinburgh and Quarterly Reviews, and some other English periodical works, are regularly reprinted in Boston.

The Massachusetts state prison is situated in Charlestown, adjoining Boston. Only male convicts are received into this building, which is conducted upon the same principle as that at Auburn. This prison was found by Mr. Crawford on his official visit in 1833 to be extremely well conducted. The attention which is paid to the moral and religious improvement of the convicts is highly creditable to the state. The discipline is strictly maintained, but its rigid enforcement is unobjectionable, inasmuch as it is with due respect that 'flogging is never inflicted until the particulars of the case have been fully investigated by the warden or his deputy, and an opportunity has been afforded to the prisoner of being heard in his defence.' From statements made by Mr. Crawford, it appears that the profits arising from the labour of the convicts are sufficient to provide for all the expenses of the establishment, and to leave a balance of profits amounting to 7000 dollars in the year.

The number of convicts remaining in confinement on the 30th of September, 1833, was 336, whose ages were:

Exactly three-fifths of this number were convicted of
larceny, twenty-one had committed burglary, ten had been guilty of offenses against the currency, thirty-six had been convicted of crimes against the person, and the remainder were confined for minor offenses against property. The proportion of re-commitments to the whole number of convicts in the district for 1825 to 1826 was one to five; the proportion was somewhat less during the last than it had been during the first half of the period.

(Life and Correspondence of Dr. Franklin, 4to. edition; Hinton's History and Topography of the United States; American Institute of the Western Hemisphere; Report on the Penitentiary System of the United States; Tables of the Revenue, Population, Commerce, &c., of the United Kingdom, part iii.)

BOSTRICHIUS (Lat.) a genus of insects of the family of Lyphphag. The body is elongated and cylindrical, very slender; the head round, capable of being retracted within the thorax as far as the eyes; eyes distinctly projecting; antennæ ten-jointed, short, the three terminal joints large and distinct, twice as broad as the remainder; the five following joints small and close together; the two remaining, or two basal joints, slightly thickened: palpi tolerably distinct, about equal in length to the mandibles, short, and three-jointed; thorax convex above, the anterior part humped; legs rather short, tarsi four-jointed, simple. The insects of this tribe are found on old trees, and in old wells, being the last animals they generally construct their burrows under the bark.

Bostrichus capricornus (a rare species in this country) is about half an inch long; the head, antennæ, thorax, and legs are rather slender; the body is black. 

BOSWELL, JAMES, Esq., was born in Edinburgh, October 29th, 1740. His father was Alexander Boswell, Esq., of Auchinleck (pronounced Affleck), in Ayrshire, who being in 1754 made a lord of session, assumed the title of Lord Auchinleck. His mother was Euphemia Erskine, great-granddaughter of John Erskine, the twenty-third earl of Mar, who was lord high-treasurer of Scotland from 1615 to 1630. After having studied law at the universities of Edinburgh and Glasgow, Boswell visited London for the first time in 1760, and made many acquaintances both in the fashionable and literary world. In 1763 a translation of the 'Espada' of More was made, as far as is known, his first essay in authorship by contributing some verses to a miscellany which appeared that year at Edinburgh, under the title of 'A Collection of Original Poems, by Scotch Gentlemen.' In 1763 he published a small volume of Letters which had passed between himself and the honourable Andrew Erskine (the brother of Thomas, the sixth earl of Kellie, the eminent musical performer and composer). This is a very characteristic volume, sufficiently prognosticating, by its style of frank expression and free opinions, the remarkable qualities of the author's subsequent productions. With his father's consent he determined to make the tour of the continent before being called to the bar; and accordingly he set out early in 1765. While passing through London he was introduced to Dr. Johnson, on the 16th of May in that year, in the back shop of Mr. Thomas Davies, the bookseller, in Russell-street, Covent Garden. He proceeded in the first instance to Utrecht, where he spent the winter in attending the law classes at the university. After visiting various parts of Germany and Switzerland, he proceeded to Italy in company with his friend the Earl Marischal, through Germany, Switzerland, and Italy. With his passion for making the acquaintance of remarkable persons, he had, while in the neighbourhood of Geneva, visited both Rousseau and Diderot, and, being in Paris in the year 1766, invented himself by means of a letter from Rousseau to General Paoli, then in the height of his celebrity as the leader of his countrymen in their resistance to the Genoese. Returning home by the way of Paris in 1766, he passed as advocate-at-law, and he prepared the account of the pamphlet, which was considered creditable to his abilities, entitled 'The Essence of the Douglas Cause,' being a defence of the claim of Mr. Archibald Douglas (afterwards Lord Douglas), to be considered as the nephew of the last Duke of Hamilton, against the claim of the Hamilton family, who disputed his alleged birth. Although he thus signalized the commencement of his professional course, his business at the bar was from the first but a secondary object. He had made his fortune from his travels so full of the Corsican chief, that he was speedily known by the nickname of Paoli Boswell. In 1768 he published at Glasgow 'An Account of Corsica, with Memoirs of General Paoli,' which was followed the next year by a duodecimo volume which he printed at London, under the title of 'British Essays in favour of the brave Corsicans, by several hands.' In November 1770, he married his cousin, Miss Margaret Montgomery of Lainshaw. About the same time his intimacy with his literary friends in London, and especially with Dr. Johnson, was drawn closer by another visit to the metropolis. In 1773 he accompanied Johnson on his journey to the Western Islands of Scotland. In 1774 he sent to the press another professional tract, being a Report on the decision of the Court of Session upon the question of Literary Property, in the cause John Hinton, Bookseller, London, against Alexander Donaldson and others, Edinburgh. It was a mere reprint of the judgments delivered by the Lords of Session in the case of William Blackwood and others v. the same counsel. In 1782, on his father's death, he succeeded to the family estate, and soon after removing to London entered himself at the English bar. In 1784 he published a pamphlet in support of the new ministry of Mr. Pitt, under the title of 'A Letter to the People of Scotland, on the present State of the Nation.' His great friend Johnson died towards the end of this year; and in 1785 he published the first and not the least remarkable sample of his Johnsonian, in a Journal of the Tour to the Hebrides. It appeared at Edinburgh, in an flock of six thousand copies, being the first edition, and having been made various unsuccessful attempts to obtain a seat in parliament. At the general election in 1790 he stood for the county of Ayr, but was defeated after an expensive contest. Before the close of the same year appeared in two volumes the first edition of 'The Life of Johnson,' which he had made and universally known, his 'Life of Johnson.' The sensation excited by this extraordinary production was very great; and if it be always an evidence of superior talent to do any thing whatever better than it has ever been done before, then a work undoubtedly, the invention and originality of which it has met with, and also the celebrity it has ever since enjoyed: for whatever may be thought of the character of either the intellectual or the moral qualities which its composition demanded, it cannot be disputed that the same qualities had never before been half so skilfully or felicitously executed. Nor has any work of the same kind since appeared that can be compared with Boswell's. The best editions of this celebrated work are the two that have been lately published by Mr. Murray; the first in 5 vols. octavo, edited by Mr. Croker; the other in 3 vols. folio, edited by Mr. John G. Lecky. And let us not forget that Boswell's 'Journal of the Tour to the Hebrides,' and many other pieces relating to Johnson never before incorporated with the present books. Boswell is said to have contributed a series of papers, entitled the Hypochriones, to the first sixty-two numbers of the London Magazine (from 1777 to 1782), which are said to be of very little merit; and a series of his Epistolary Correspondence and Conversations with many eminent Persons, according to Watt's 'Bibliotheca Britannica,' appeared at London in two volumes quarto, and was continued to 1793. He was preparing a second edition of his Life of Johnson at the time of his death, May 19th, 1795. He left two sons and three daughters. (The fullest and best account we have met with of the life of James Boswell is to be found in Croker's Edinburgh Journal, No. 199, for Nov. 21st, 1832.)

BOSWELLLIA, a genus of balsamic plants belonging to the natural order Burseraceae, and consisting of two species, one of which is believed by Colbrough to be the Libanos of Theophrastus and Dioscorides. This species is yielded by the Lycian juniper; but that plant is a native of the south of France as well as of the Levant, and the botanists of that country deny that any such substance is produced by their juniper. The Greeks obtained their frankincense from Arabia. The Arabsians call olibanum both Luban and Cundur; but as benzois is most used at the
present day for religious purposes, the Mohammedan writers of India on materia medica apply only the term Cundar to obihanum. This Cundar has been ascertained by Messrs. Colebrooke, S. W. Hunter, and Roxburgh to be the subject of the present article.

Boucerea thurifera, as botanists call it, is a large timber-tree found in the mountainous parts of India, yielding a most fragrant resin from wounds made in the bark. Its leaves are deciduous, about one-third to one-fourth of an inch in length, oblong leaves, each of which is from an inch to an inch and a half in length. The flowers are pale pink, small, and numerous. The calyx is five-lobed, the corolla of five downy petals, the disk a fleshy crenelated cup, and the stamens ten, alternately shorter. The fruit is a three-sided, three-valved, three-celled capsule, containing a single-winged pendulous seed in each cell.

From this Roxburgh distinguishes as a different species Boueelia glabrata, a plant also yielding a resin which is used for incense and as pitch in some parts of India. It differs from the last in having no hairs on its leaves, in the leaflets being often toothless, and in its flowers being panicked.

BOSWELLIA THURIFERA. (Colebrooke, Asiatic Researches, ix. p. 377; Roxb. Fl. Ind. ii. p. 383.) It is necessary to refer to the figures in this last named paper which accompany this plant, and to compare them with the B. serrata of Stackh. extr. Bruce (p. 19. t. 3), which is generally regarded as a synonym of this plant. For the reasons for distinguishing them, see Wight and Arnott's Flora Indica, i. 155, 156, and George Bentos, i. 473. B. thurifera, Linn., J. lyciia, Linn., J. tetragona, Mönch, the B. thurifera, Linn., or J. himpanica, Lam., and even from the J. oxycedrus, Linn. Some persons are still of opinion that the Arabian obihanum is derived from a juniperus; which, if it were so, would not make the plant here described any better than the Indian obihanum, is very improbable, for as Nee von Esenbeck justly remarks, the coniferæ yield only pure resins, or resins consisting of resin, volatile oil, and subresins, but in no case any gum-resins. Indeed, if the Arabian obihanum be not obtained from a Boswellia, it is most probably yielded by a Balsamodendron: (Kafal? Förr.) possibly only a variety of B. Kataf. (Försk.) at least the wood of this tree is used to burn as a perfume in the mosques.

A substance analogous to obihanum, and used in a similar way in various parts of the world, is procured from several different trees, such as, in America, the Croton nitens (Schwartz), C. thurifera (Kunth), and C. adipsum (Kunth); in Colombia, Batillaria nitertifolia (Kunth), yields the American frankincense; in the Amuri (Cocos Tacos) (Kunth) yields the resin coumar, likewise called American frankincense.

Laeita apetala (Jacq.) also yields a substance similar to frankincense.

Obihanum occurs in commerce of two kinds, the Arabian and East Indian: the former kind is now seldom met with, and its origin is a subject of doubt; the latter is obtained from the tree above described, and to it we limit our remarks. There are two varieties or degrees of fineness of it, the best called obihanum electrum, or in grâmas, sometimes called obihanum arecolinum, the worst, or Indian obihanum commune, or in sortis, also foemineum. The first occurs in pieces varying from the size of a hazel-nut to that of a walnut, or larger, which are roundish or irregular in shape, of a light yellowish colour, varying to red or brown in some pieces, opaque or semi-transparent, the outside often covered with a white powder, and upon being pounded the whole becomes a white powder. It is very friable, and breaks with a dull, sometimes even, sometimes splintered fracture. The other is generally in larger pieces, mostly of a dirty-grey or fawn colour, and intermingled with pieces of wood and other impurities.

The colour of obihanum is faint and peculiar, but pleasantly balsamic, which is increased by heat, and when inflamed it burns with a steady clear light, which is not easily extinguished, diffusing a most fragrant smoke. It leaves behind it a black ash. The taste is balsamic, slightly acid and bitter. Being a gum-resin, it is not perfectly soluble either in water or alcohol; with the former it forms a milky fluid. It consists of gum-resin and volatile oil: the latter principle is the cause of the odour of obihanum; the resin is not often adulterated, but an inferior or the Arabian kind is often substituted. The latter is frequently intermixed with mastic, gum-sandarac, or Burgundy pitch: when there is much of this last article, it may be discovered by the taste, which is more agreeable than the true gum.

Obihanum is now seldom used in medicine: it possesses the properties common to balsamic substances, and may in the absence of inflammatory symptoms, or after appropriate antiphlogistic treatment, be used as an expectorant. It is more useful externally as a rubefacient and antispasmodic, especially applied as a plaster to the teeth, in cases of cramp or spasm of that organ. It is however principally employed to burn as incense in Catholic churches.

BOSWORTH (commonly called MARKET BOSWORTH, to distinguish it from another place of the same name in the hundred of Gastea), a parish in the hundred of Sparkenbo, co. of Leicester, 55 m. N. W. by N. from London, and 12 m. W. from Leicester. It is called Boswords in the Domesday Survey, which mentions the demesne as containing a wood one league long and half a league broad, and names a priest and deacon among the occupants. After mentioning Boswords and some other demesnes, it concludes rather curiously with,—all these lands Saxi held, and might go whithersoever he pleased.” This Saxi lived before the Conquest, it would seem, as one Hugh de la Marre, and the Earl of Mellent are named as the existing proprietors.

The small town of Bosworth is pleasantly situated upon an eminence, in the centre of a very fertile district, and contains several good houses. It has no manufacture of consequence. The inhabitants are mostly connected with the navy, and affords occupation to many persons here and in the neighbourhood. The Ashby canal, which passes within a mile of the town, has given facilities for the obtaining of coal and other commodities. There are now two regular fairs for the sale of corn and horses. The annual parish fair is celebrated every year. The parish contained fifty-four houses in 1831, when the population was 2530, of whom 1806 were females.

There is a free grammar-school at Bosworth, founded by Sir Wolston Dixie, lord mayor of London in the reign of Elizabeth. He built in his lifetime the plain but neat school-house, which has within these few years been taken down and rebuilt in a more commodious form. The endowment produced, some years since, upwards of 700l. per annum. Sir Wolston also founded two fellowships and scholarships in Cambridge, in the University of Cambridge, for the benefit of persons either related to the Dixie family or educated at the school. Owing to the charity being mismanaged by the founder's representatives, a suit in Chancery was instituted, which continued above twenty-five years, and as the charity was suspended; but the proceeds of the estates, being sold and repurchased, was again distributed in that time to a very large sum, the judicious appropriation of which may render the Dixie free-school a most important establishment. Simpson, the eminent self-taught botanist (a native of the town), was usher of this school; and also Dr. Johnson, when a young man.

The decisive battle between Richard III. and the Earl of Richmond, when the death of the former, after a bloody struggle of two hours' duration, terminated the long strife between the houses of York and Lancaster, was fought, August 22, 1485, on the banks of the River Welland, near the town of the same name, south of the town. This fine and spacious plain, which is nearly surrounded by hills, was formerly called Redmore Plain, from the colour of the soil; but since the battle has been called Bosworth Field, from the name of the nearest town.

The plain is rather of an oval form, about two miles in length and one in breadth. At the time of the battle, it was one piece of uncultivated land, without hedge or timber, but is now so altered by both, that nothing of its former appearance remains for the present ground. The spot where Lord Stanley placed the battered crown upon the head of Richmond, and hailed him king, is now known under the name of Crown Hill. There was also a well which was called King Richard's Well, under the notion that the monarch quenched his thirst during the battle. Dr. Parr, who visited the spot in 1812, found that it had been drained and closed up since he was
there six or seven years previously; his representations pro-
cured a subscription for the purpose of raising a suitable
monument on the spot, for which he furnished an appro-
priate Latin inscription.
Numerous relics of the battle have at different times been
uncovered, and ploughing the soil,—such as as-
shields, crosSES, arrow-heads, halberds, pieces of armour,
rings, spurs, and sometimes human bones and skeletons.

Schools; Hutton's Battle of Bosworth Field; Gentleman's
Monthly Magazine, 1819.]

BOSZORMENY, or BOESZORMENY, a Haidek-
town in the Hungarian co. of Szabolcs, not far N.W. from
the town of Debrecyn. It has a civil tribunal, a Protestant
and a Greek-Catholic church; the inhabitants principally
on their support live by agriculture. The county is a
pop. of about 12,000; and is the seat of the captnacy of the
Haidek districts, 47° 39' N lat., 21° 30' E. long. We may here
remark that these districts consist of level tracts of country,
whereon a few corps of Hungarians, Servians, and Walla-
chians, raised by John Corvus, vice-llutenant of Hungary,
received permission to settle from Stephen Botakay, prince
of Transylvania, to whom they had rendered very important
services in the field. The present possessors of the Haidek
districts are their descendants, and enjoy the privileges secured
over several centuries to the Hungarian invaders fixed on
their first settlement in the time of Mathias I. king of
Hungary. They were placed under the control of a capt.
ain-general, and the subsequent kings of Hungary (latterly
emperors of Germany or Austria) have continued their
predilection for the Haidek: we observe, that the district,
which is divided into three distinct portions, chiefly in
the co. of Szabolcs, and partly in that of Bihar, amounts
to about 372 sq. m. The people speak the Hungarian
tongue, and five-sixths of them are Calvinists, the re
mainder are Roman Catholics. In 1764 their numbers
were 26,736; in 1831 they appear to have declined to
27,732.

BOTANICAL GARDENS. [GARDENS.] BO-TANY is that branch of science which comprehends all
that relates to the vegetable kingdom. The term Bo-
tany is connected with a Greek word that signifies
any kind of grass or herb, and botanik (botanik) the
art which teaches the nature of plants and herbs.
The structure of plants, their mode of growth, their habits of
life, their mutual relations, their uses to man, or the danger
that results from their employment, the station they occupy
in the scale of the creation, and many other similar consi-
derations, form an extensive field of inquiry which botany combines into one connected whole. This statement
will serve to show how imperfect a view of the subject is
taken by many who are only twigs in the immense
planting of classifying plants is the great end of the science, and one of the most humble of its means, unless it is conducted
upon great general views and sound philosophical principles.
In an article of this kind it would be impossible to enter
very fully into the specific and technical details of the
subject; it is, however, the function of botany to
be appended a glossary of the botanical terms most frequently in use.
1. A general view of the nature of plants: 2. The history
of the steps by which botany has advanced from its rudest
state to its present condition as a science: and 3. The prac-
tical purposes to which the mass of knowledge applies: to
which will be appended a glossary of the botanical terms
most frequently in use.
1. To our ordinary apprehension a plant is an organized
body, attached to the surface of the earth by roots, which at
one time or another absorb from the soil sufficient moisture
except from the agency of external influences, destitute of
perceptibility, living by aid of its leaves, and multiplying
by the power of its flowers, fruit, and seeds.
To enable it to execute the functions of nutrition, its
leaves absorb the products of decomposition and assimilate
the fluid or gaseous matters which are obtained by the roots
from the soil and conveyed into the leaves through the stem:
these parts are also capable of returning the elaborated matter
back into the stem, or to those organs in which its presence is
most required. To bring about the phenomena of reproduc-
tion, the ovum is expelled in female beings, and in certain
species successively a calyx, which protects the interior of
the flower, and a corolla which gives it beauty; stamens, whose
points are filled with a fertilizing power, and a pistil which
is furnished with the means of impinging the fertilizing in-
fluence and conveying it to the young seeds enclosed within
its cavity. The latter are fed by the nutritive matter ela-
borated by the genuine leaves until they are full grown;
they are in the mean while guarded from external injury
by the fruit which grows with their growth, and at last con-
tain a miniature representation of their parent enveloped in
many folds of tissue, protecting it in its early state from
producing a being exactly like that by which it was itself
produced, whenever it is committed to the soil from which it is
in its turn to obtain its food.
In a more general point of view, a plant is to be con-
disidered as a set of closed, intercommunicating, evenly elec-
tric, irritable bodies, called tissue, formed of an excessively delicate membrane, and combined into various organs, by means of which the functions of its life are carried on. This tissue occurs in several different forms, all of which are reducible to the col-
lected description of epithelium, which, as the term implies, is the most important is the cellular. This kind of tissue consists of little bladders or vesicles, which, if developed in a medium in
which they experience no resistance, would be of a spher-
oidal figure, but which lose that form by being exposed to
various degrees of compression in consequence of which they are found in a state varying from the form of a
rhomboidal dodecahedron to that of extremely elongated
parallelograms. Such tissue as this constitutes the basis
of all vegetables, generally by far the largest part of them,
and the two other forms of secondary importance, are generated subsequently, and are probably mere modifications of it. It appears to be
indispensable to the propagation of species, forming the fer-
tilizing matter in flowering plants, and being that by means
of which the species of flowerless plants are exclusively pro-
gressed.
Fibrous tissue consists of tubes of variable length packed
closely side by side.
Vascular tissue has the appearance of transparent threads
 twisted spirally like a boll-wire within a membrane, and
either readily unravelling in consequence of the cohesion
of the contiguous spires and then contracting when the force
was required to unroll them is removed, or not capable of unrolling, in consequence of the cohesion of the spires, and assuming the appearance of a tube without a lumen. It resembles in some respects that of an interruption of the continuity of the cohering spires,
that of a cylinder covered with broken bars or interrupted
fissures.
It may possibly be supposed that these elementary parts are readily recognized upon a mere casual inspection,
that they bear some considerable proportion in size to the
plants themselves to which they belong, and that nothing
more is necessary than to pull a portion of any vegetable
matter in pieces to discover those bladders, fibres, and
spires, and then to determine what may be of use. To the
truth of the case, that an observer would certainly recognize nothing of what has been mentioned, by inspection with the naked
eye, except perhaps in the pith of a few plants, such as the
elder for instance, in which it is possible to distinguish the
text of cellular tissue. The fact is, that without multitudes
of individual cells, or vessels, or fibres, are required to
form a but a very small portion of vegetable matter. So
ceedingly minute are they, that it has been calculated that
above 10,000,000 vesicles of cellular tissue are contained in
a single grain of barley, which is about one inch across,
and something less than half an inch thick. A single thread of hemp, which is not thicker than a human hair, is
composed of a considerable number of tubes of woody tissue
glued together; and the stalk of a strawberry leaf conceals
in its minutest structure many of the details just outlined;
thus infinitely minute, and as we must suppose infinitely
weak in each individual case, though of surprising
strength and force in a state of aggregation, is the whole
vegetable world constituted, and by their agency are all the
developing actions of vegetable life maintained in a state
of ceasless activity.
For the adequate performance of such functions tissue has certain special powers; the most remarkable of which are
cohesion and permeability to fluid or gaseous matter. It
would be difficult to conceive how a flower or fibrous or
vascular tissue could be combined into bodies of such a
kind and uniform figure, unless the property of mutual cohesion
were to exist. We know in fact that this power is universal
in the vegetable kingdom, and that all contiguous surfaces
in plants either uniformly do, or frequently will cohere,
and so firmly that no traces of the union can subsequen-
be discovered. Thus, cellulose adheres to cellulose; a 
dodecanon has another cellulose firmly united to each of its 
twelve plane faces, a parallelogram is surrounded by six, 
and so on; and cylinders cohere side by side where their 
surfaces touch each other. In like manner as cellulose grows 
to cellulose and fibre to fibre, so do contiguous masses of 
such substances as are in contact with one another, till arriving at a most com-
plete state of hermaphroditism; and finally, one plant may 
be made so to grow to another, that in a short time no 
trace of the union are left, and to our senses a complete 
assemblage of their respective individuality is effected. 
And the same may be said to be the case with the species with another which takes place between parasites, 
properly so called, and the tree that bears them; but 
rather to the artificial combinations which man has from 
very distant ages had the power of making for his profit 
or his pleasure. Thus we take a branch of one plant and 
apply its tissue to that of another even of a different 
species; a strict adhesion speedily takes place, and a new 
individual is the result, consisting of two species firmly 
united to each other, each possessing its own particular 
sways and peculiarities, and peculiarly incapable of being 
separated in death. Upon this property depend the gar-
dening operations of grafting, budding, inarching, and so 
forth.

In the next place, tissue has the power of transmitting fluid from one part to another through its membranes. This 
membrane has been already described as transparent, nearly as 
much as so glass or tallow; it is also perfectly continuous, 
without the slightest trace of perforation or pore. It has 
been supposed, indeed, to be furnished with pores visible 
with the microscope, but all observers have generally 
assumed this is not the fact. It is however undoubtedly 
permeable, not only to gases or the more subtle fluids, but also 
to water and substances held in solution by it, which pass 
through the membrane with the greatest facility. Hence, 
without having the power of dissolving the substance by 
which it is received, or of any of its components being 
acted upon, the processes of absorption and perspiration are 
as constantly and regularly in action as in the animal world.

How perfect must be that permeability, and how efficient 
the means for the transmission of the fluids, by which 
plants are nourished, may be easily collected from this fact, 
that the tiny leaves of the gigantic pine-trees of North-
west America must some of them be fed from a distance of 
250 feet, through all the sinuosities and obstructions of 
tortuous branches, and still more tortuous veins; in such a 
case as this the nourishing leaf of a single leaf would 
be at least 5000 times greater than the leaf itself.

We are accustomed to regard a plant as an individual 
consisting of a central part, called a root and stem, round 
which various organs known by the name of scales, leaves, 
bracts, flowers, and finally fruit, are arranged in a certain 
circle; and to consider an individual plant as a nature ana-
logous to that of an individual animal, having a term of 
time within which the duration of its life is fixed. Thus 
there plants that are born and die in a day, such as the 
ragweed, the wild rice, the grasses, and many other species 
whose existence is perhaps not much longer, such as infusoria; other plants 
are animated for a few months, increase their species, and 
die, like many insects—while the remainder of the vegeta-
table world having; like the higher orders of animals, no 
fixed life, and always renewed by the generation of young 
ones. Undoubtedly, in one sense, a plant is to be considered as an 
individual, but not in the sense in which we have ad-
ted. In an individual animal the loss of any limb is pro fano destructive of its functions: the removal of a 
leg, an arm, an eye, a ear, is a matter of indifference, a mere 
eye of seeing, of a hand of holding, and so on, while the 
removal of some organs, as the head or the heart, is 
instantly destructive of life altogether, and the individual pe-
rishes. And again, the individual animal has but one 
pair of eyes, ears, mouth, etc.; the plant, on the contrary, 
being composed of as many parts as it has leaves; any 
injured, can never be replaced. Not so plants. From a 
dividual plant limb after limb may be lopped away with- 
out detriment; its head, its roots, its roots, may be mutilated, or 
even removed, and yet its vitality remains unimpaired; its very 
heart (i.e., heartwood) may be scooped out or rot away by dis-
ease, and yet its life and all its functions go on as before. If 
deprieved of the power of procreation in one part, an hundred 
other sets of apparatus are ready to supply the deficiency. If 
plants were to perish as readily as animals, the world 
would soon be a barren waste,—so exposed are they to 
accidents, and so constantly destroyed for the purposes of 
man: roads were made to destroy them, the power of 
incineration, one of 
defence, injuries such as are fatal to animals are of constant 
ocurrence with them. Their organs of reproduction are 
either in the form of flowers or of fruit, the most attractive 
or most useful parts that they possess, and are continually 
seen from them to admire the beauties or necessities of 
animals. Undoubtedly such an explanation of the cause 
of the difference between animals and plants is both pleasing 
and true. But the philosopher cannot pause thus at the 
threshold of his inquiry; he must also seek to explain 
the like differences in a manner equally necessary, 
and of vegetable vitality, and to discover how it happens 
that the individuality of the two kingdoms is so essentially 
different.

The first person who advanced fairly to approach this 
subject was Dr. Darwin, who about forty years ago pub-
lished his opinion, that plants were a lower order of animals 
ana
gouls to corals, and endeavoured to prove the truth of 
his theory, by demonstrating a direct analogy between 
plants and animals in every organ of nutrition or reproduc-
tion. His hypothesis was thus, that plants,—and this, it 
may be easily accounted for by the facts on which he re-
lied, being so much mixed up with fanciful and inaccu-
rate matter, that discredit was cast upon his whole theory. And 
yet it cannot now be doubted that the analogy that he 
advanced to show that plants are lower than animals is 
day by day becoming more and more certain, even to the point of 
a distinct circulation of blood in the vegetable kingdom; 
but that what we are justified in calling the most original 
and most important part of his theory was strictly true, 
we shall proceed to explain.

If we look a little closely into the structure of a tree, we 
shall find that it is composed throughout of tissue arranged 
in the same order, exactly, in every part: for instance, if at 
the bottom of the stem there is cellular tissue in the centre, 
there are fibres outside it, and vessels of a different 
order, exactly the same being arranged in the 
very same manner will exist in every division of the stem.

So that except in diameter there is no essential difference etwixt the trunk of an oak, for example, and its most 
stenchiest twig. Again, with regard to the manner in which 
the stem, or the branches, or the twigs are surrounded 
with leaves, and flowers, and fruit, it will be found upon accurate 
observation, that whatever may be their disposition, or pro-
portion, or nature in the first shoot that a germinating seed 
shall have made, the same will be the disposition, propor-
tion, and nature in the branch that the seed shall have 
so that if a tree consists of a million twigs, it will consist of 
a certain arrangement of external and internal organs, a 
million times uniformly repeated. It will be further re-
marked that the original twig, produced upon germination, 
spreading from a vital point, or bud, never varying in its 
form and appearance from the part, while those of the 
seed croop beneath the soil.

Such observations as these cannot fail to lead to this 
conclusion, that the cause of plants bearing the most extensive 
mutations with impunity, in which they so especially 
excel the higher animals, they being the lowest and most 
compound individuals, with as many distinct seats of vitality as 
they contain buds; and that consequently when branches are 
lopped off, or flowers and fruit gathered, we only sepa-
rate from a large mass of individuals a small portion of the 
community, the absence of which is no more missed by, or
productive of no greater inconvenience to those that remain, than the swarming of bees to their parent hive.

We may therefore judge that they bear a close analogy to corns, and pimpls; and this leads us to the inquiry as to how plants differ from the animal kingdom.

If animals consisted only of quadrupeds, and birds, and fishes, and vegetables were confined to trees and herbs, no conceivable difficulty of assigning to each kingdom the most proper characteristic extension. For it sees how wide a difference exists between the larger animals and the more conspicuous plants: the lesser we are acquainted with the subject, the more easy is the task of distinguishing them; but to those who are acquainted with the inferior flowers and insects, and fungusses, which are included within these kingdoms, the limits which divide them will be found to present one of the most difficult problems in the philosophy of natural history.

As an ingenious French physiologist has well remarked, it is not a question about what are the characters peculiar to animals, but what are common to them all. We know very well that they only have brain, nerves, muscles, a heart, lungs, a stomach, and a skeleton; that they move, digest, respire; that they have blood, and appear to have sensation; but what remains of all these characters when we descend the long chain that they form, from the first link to the last. Almost nothing. Lungs, glands, brain, skeleton, heart, arteries, blood, nerves, and muscles, successively disappear, till at last we are not sure whether we have even the animals of which we hear before, p. 270.

If a comparison is instituted between the highest form of development in each kingdom, between a human being and a tree, the differences are too striking to escape the most ordinary observation. We see that animals are endowed with the power of locomotion, or the power of transporting themselves from place to place; that they live upon organic substances which their powers of locomotion and perception enable them to select; that their food passes through an alimentary cavity, from which that nutritive products are transferred by means of absorbent vessels into the system. Plants, on the contrary, are destitute of all traces of a nervous system and consequently of perception; they are fixed to a particular spot whence nothing but mechanical power can remove them; they have no powers of locomotion, nor of a mechanical agency; they subsist upon such inorganic matter as surrounds them, and their food is at once introduced into their system by absorption through their external surface only.

Vegetables are also said to be compound beings, animals simple beings. For illustration, whatever objections may be taken to such a comparison, the latter may be considered, with Link and Blumenbach, to have only one seat of life, the sensory commune, and to have but one provision made by the world for its wants; whereas the former, incapable of reproduction by various means from various points of their body, must have the seats of vitality as numerous as the parts which are thus capable of self-perpetuation. Hence articulations, buds either latent or developed, and seeds, are in plants so many distinct seats of vegetable life.

While all-powerful man has but one feeble means granted him of perpetuating his race, millions of millions of individuals, which in a physiological sense are identical the same, have been produced by the half-dozen potatoes brought to Europe in 1784, and have extended from the ordinary means which nature has given plants for their multiplication.

Among the distinctions between the animal and vegetable kingdom, that which demands the first consideration is the different means possessed by animals and vegetables of procuring food and of imbibing nourishment. Animals have the power of moving from place to place, and are gifted with perception, which enables them to distinguish what is proper for their sustenance. They are also furnished with organs of digestion which are capable of converting into nutritive substances very hard substances. As their food is only procured by an act of exertion on the part of the animal, and as this exertion is not continual and uninterrupted, but only takes place at intervals of time, they are also provided with an internal means of storing the nutritive substances in reserve; from this reservoir, called the stomach, the absorbent vessels conduct the elaborable parts into the system, while the solid useless parts are rejected: animals therefore are nourished by internal absorption. Vegetables which are continually rooted to the same spot, which have no power of roaming from place to place in search of aliment, which have no organs capable of distinguishing between the useful and the hurtful, the wholesome and the noxious, but which are compelled to derive their support from such matter as chance may place immediately and continually in contact with them, and which therefore experience no certain need to render the supply of food, are not provided by nature with organs of this sort. The formation of the excrement of these organs renders a stomach unnecessary; internal absorption or intussusception of nutriment cannot take place; and we accordingly find that their existence is sustained not by an uncertain periodical introduction of food from an internal reservoir, but by the constant direct introduction of food matter perpetually about them, through pores of their surface too fine for human perception. Nothing therefore which requires to be divided by mechanical force, nothing which needs to be altered in its texture or substance before it can be used, or to be digested, which has hitherto been sought for, nothing in short but matter which is so delicate as to pass through perforations, which the human senses, aided by the most powerful microscopes cannot distinguish, is fitted for the support of plants; and no inorganic matter exists which answers to this description, but water or air, or substances held in solution by these two elements, and such in fact are the materials by which vegetables are supported.

As in animals, nourishment is derived from their centre, so follows that all their absorbent vessels have a direction towards that centre; and for the same reason, as in plants, nutrition is communicated from the outside, so is it in that direction that all the absorbent vessels of the vegetable are directed. The consequence of these two laws is, that while in animals, no limit seems to be fixed for that of the most perfect vegetables. The former perish as soon as their original vessels become incapable of performing their functions; the latter endure until the power of forming new vessels shall cease. The period to the former is fixed, to the latter unlimited. Hence an eloquent French writer has ingeniously said, that animals die of old age or accidents, vegetables of accidents alone. Hence also the incredible age to which certain trees arrive. The oaks of Mount Lebanon are said to have been calculated by a French botanist, from actual inspection, that the age of the baobab trees of Senegal must have exceeded 6000 years. These are the most decided differences between animal and vegetable life, and are almost without exception.

Plants which have a habit of growing higher than their vegetable food, have a term fixed to their lives, just as animals have, but no plants can be pointed out in which nourishment does not take place from the outside. When we descend in the scale of being, when we arrive at those limits of vegetation, we find that the sense of sensation is indistinguishable, and from which the two kingdoms seem to diverge as from a common point, even there we find the polypes, which are so simple in their structure that they may be turned inside out like a glove, always conforming to this law. Zoologists assure us that they still absorb from the inside even when that part of the body which was once the outside has to perform the duties of a stomach.

But with this exception, we know of no absolute external distinction which has yet been discovered between animals and vegetables. The ingenious idea of Mirbel, that animals live upon organic, vegetables upon inorganic matter, must, as respects the infusorial animalcula, be a purely hypothetical difference, and in more perfect animals is not true, as has been shown by Mr. William MacLeay, who asserts that "many animals of the lower tribes, and some Heteromorous Coleoptera, have been observed to feed upon inorganic matter." (Hera Entomologica, ii. 193.)

If we now reconsider the observations which have just been made, we see that when we speak of animals and vegetables as being essentially different, it is in the same manner as if we spoke of the vegetable and animal kingdom as being essentially different. If we wish to consider the vegetable kingdom, and argue from the vegetable kingdom and infer to animals, we must at once see that we are not dealing with what is necessarily real, but what is the result of an opinion. But how are we to apply these distinctions to the lower orders of created beings? Among these we find productions, which it is impossible, by the characters now assigned, to refer with any exactness either
to the one kingdom or the other. A drop of water and a little brown or green slime from a ditch will often afford abundant material for accuracy. Accurately observed, the invertebrates are seen to have a sort of starting motion, very distinct and continued, but they do not seem capable of turning on either axis; nor is any motion of contraction visible; they vary in length, according to De Blainville (Dict. des Sc. Nat. 34, 367), from the fifth-hundredth to the thousandth of a line, and when full grown exceed these dimensions considerably. By Müller, a standard writer upon insularian animals, they are considered animals, and referred to his genus Vibrio, a part of which consists of bodies of an undoubted animal nature. Modern observers say they have no name, and name them merely Navi-
cula. When young when they are attached to confluence a stalk so delicate as to be almost invisible with the aid of the most perfect microscopes, and during this period they have, according to M. Bory de St. Vincent, no visible motion whatever; but when the Navicula is fully formed it separates from the plant on which it grew, swimming and starting about in the water in the way described. Are such productions animal or vegetable? When young they are motionless and vegetable like a minute plant; when full grown, on the contrary, they combine all the properties of a living animal, such as movement, and may say they are the latter, and compare their vegetating state when young to that of the Polyce, called Vorticella, an undoubted animal, if rapid and varied motion can make it so.

Among confluence in ditches are often found little fragments of organisms, similar to the confluence. Perhaps among these, some smaller or coarser, containing a number of narrow transverse portions, others dividing partially at their articulations, but adhering at their angles like chains of square transparent cases. These enter the genera called by naturalists Dia-
toma, Fragilis, etc., and by A. de C. Eustal, and by Dr. C. de Serre, under the names of Navi-
cula or planulae? When combined they are motionless, with the appearance of confluence, their transparent joints filled with the green reproductive matter of such plants; but when they disarticulate, their separate portions have a distinct sliding or starting motion. Shall we say, then, that M. Bory de St. Vincent has assigned in a voluntary ca-
civity which no one has seen them assume; or shall we be rather justified in viewing them as links between the animal and vegetable kingdoms, and endowed with the cha-
acters of both.

Confervaria, or Draparnalida, is a plant-like body, which, according to Mesnil, Mertonis, and Gaillon, is sometimes an animal, sometimes a plant. The former says that he has frequently seen it undergo its transformation, parti-
icularly in August, 1822. On the 3rd of that month he observed a very small number of plants on the 5th it had disarticulated into portions distinctly mov-
ing in water, which on the 6th began again to unite, and on the 10th became finally combined in their primitive state of confluence. (Dict. des Sc. Nat. 34, 373.)

It perhaps may be said that the instances yet given are not at variance with the distinction of animals and vegetables by their power of motion; and that as they are all inert in their most perfect state, their giving birth to moving bodies does not make them animals any more than the produce of motionless eggs by birds, reptiles, and molluscs makes them vegetables.

In which kingdom then are we to station the curious Poly-
physa, a most undoubted polyp, according to Lamouroux, LeMa, and De Blainville; an equally certain plant if we are to believe Turner, Agardh, and Gaudicheaud, the last of whom found it living, and describes it thus. It grows in thick tufts to the shells which are thrown ashore upon the barren coast of Shark's Bay in New Holland. Each individual consists of a Twlilar, capillary, greenish stalk, about an inch or more in length, presenting, except when some rocks or a sort of root-like claw, by which it is fixed. At the end it bears from fifteen to eighteen sacs, which are entire, rounded at the end, and slightly attenuated to the base; each con-
tains a multitude of little round green globules, which 

To which kingdom are we to refer the beautiful (Sal-
manella and all the other plant-like bodies, for example Confo-
conjugata, or Zygopes, which Mesnil, Gaillon, and De Blainville assert to be of animal nature, but which grow like vegetables, from which they are undistinguishable by 

external characters. They are transparent tubes, having 
distinct articulations and transverse partitions, the cavity 

filled with a greenish substance, and combined in the most beautiful symmetry in one or more spires, which, 

separating at a certain period of their existence, and passing 

through the sides of the tube, develop in the form of new 
tubes exactly like their parent. When in a perfect state 

these confluence are continuous tubes or filaments unite in a manner completely animal in appearance, uniting at one period, sepa-

rating at another, and finally combining themselves into 

a single and uniform being.

Lastly, where are we to place the oscillating confluence, 

which is similar to the confluence, although varying over the earth in damp and shady places, or form mucous patches among the confluence and polypes of stagnant water, or appear under the form of a rich carmine stain, bordered with resplendent violet and blue, on the surface of hot springs, in all parts of the world; 

productions which, according to the speculations of an inge-

nious Swedish naturalist, have once possessed an animal 

life, of which they now only retain the appearance. These 

oscillators consist of articulated tubes filled with green 

granules, and grow and increase like confluence, and the 

regularity and precision of their movements is such that 

an observation shows that this is true, and that even when 

chemically examined, they have been found to exhibit many 
of the characters peculiar to the animal kingdom ; and 

when burnt, yield a carbon of the most solid odour, exactly 

resembling that of decaying animal substances.

Such an instance with that naturalist has to overcome who would fix the limits between the animal and vegetable kingdoms. It is clear that the power of voluntary motion exists in beings having a distinctly vege-

table structure, both in the most perfect state and in a state of disintegration; that the absorption of nutrition from the inside in the one family, and from the outside in the other, is a character not appreciable in such creatures as the 

monads, and the vivifying animalculae of flowering plants; and, finally, that chemical differences are destroyed by ana-

bama and oscillators. In this difficulty shall we admit, 

with M. Bory de St. Vincent, that between animals and plants, characterized as consisting of insensible individuals, that develop and increase in the manner of vegetables, up to the period when they separate into animated germs or reproductive fragments; or shall we regard the vegetable character as existing between animal and vegetable nature as a striking proof of the 

beautiful harmony of nature, and of that unity of pur-

pose which is so visible in all the works of the Creator; as 

an evidence that all the forms of life are but assemblages in insensible gradation of the same living matter differently 

combined by the great Spirit that pervades all matter and 

all space?

II. In treating of the history of this science, we have no 

intention of entering upon details which can only interest 

systematicists engaged in the study of the vegetable, or its 

followers may have taken; but, on the contrary, we shall 

confine ourselves to a mere sketch of the progress that has 

been made in elucidating the great principles by which its 

rank as a branch of philosophy is to be determined.

It is obvious from various passages in the most antient 

writers, that the art of distinguishing certain plants having 

medical virtues was taught at the earliest period of which 

we have any written record; and that the cultivation of 

something more than corn was already understood in the 

world. In the Bible there is a comprehensive mention of 

the vineyards of Labores and the gardens of Alcinous, and by 

the employment assigned to Lyconus, the son of Pria, of 

pruning figs in his father's garden.

The earliest tangible evidence that we possess of the 

real family of plants is the speculation of Garden, the name 

of the writings of Aristotle and his school. From the 

absurd superstitions of the root-cutters (rithotomi) of this 

period it might be imagined that at this time botany was far 

from having any real existence; for it is to them that we 

have to trade the belief in the necessity of magical ceremonies and personal purification or preparation in collecting herbs; some sorts, they tell us, are to be cut against the wind, others after the bow of the rhizomastikon has been alit, some at night, some by day. Allaisceous food was a necessary preparation for procuring this herb, a draught of wine for that, and so on. But in fact at this very time the Peripatetic philosopher were in possession of a considerable mass of correct information concerning the nature of vegetable life, mixed up indeed with much that was false and fanciful, but calculated to give us a high opinion of their acuteness and of the amount of positive knowledge upon such subjects which had by that time been collected. It is by this school that botany must be considered to have been first formed into a science. Aristotle, in all probability, was its founder; for it is obvious from the remarks upon plants scattered through his books concerning animals, that his knowledge of vegetable physiology was, for his day, of a most remarkable kind. But as the books immediately concerning plants ascribed to this philosopher are undoubted forgeries, it will be more convenient to take the works of Theophrastus as our principal guide to a determination of the state of botany at the commencement of this—

The First Era.—At the time when Theophrastus succeeded to the chair of Aristotle (n. p. 324) no idea seems to have existed of classification, nor indeed was it its necessity by any means apparent, for Theophrastus does not appear to have been acquainted with above 355 plants in all. In the application of their names, even to these, there was so much uncertainty and diversity that the names of species were often continued down to the last sheet, especially attracted his attention. He distinguished naked-seeded from capsular plants, and he demonstrated the absence of all philosophical distinction between trees, shrubs, and herbs, for he saw that myrtle-trees would degenerate into shrubs, and certain oleaceous plants become arborescent. Cellular tissue is spoken of as a sort of flesh interposed between the woody tissue or vegetable fibre; and even spiral vessels appear to be indicated under the name of _fines_ (locus); leaves are correctly said to have their veins concrescent, and the parallelism of the veins of grasses is particularly pointed out; palm-wood is shown to be extremely different from that of trees with concentric layers; bark is correctly divided into inner and cortical integument, and the loss of the former means a destruction of the plant, as the active properties of leaves are clearly pointed out, and the power which both surfaces possess of absorbing atmospheric nourishment. Some notion appears to have existed of the sexes of plants, contrary to the opinion of Aristotle, who denied them to the vegetable kingdom; in particular Theophrastus speaks of the necessity of bringing the male dates into contact with the females, a fact which had been stated quite as clearly by Herodotus (1. 193) 100 years before; but it is plain that he had no correct idea upon this subject, for even the sexuality of plants, which Aristotle had defined, which Theophrastus had adverted to, is spoken of in positive terms; grafting, in more ways than one, and even budding, are spoken of in language which is remarkably precise for the words of a poet; and although to these operations were attributed powers which they did not possess, yet it is abundantly plain that the processes were thoroughly understood.

_Antropous_ in ipso
Pit nodo sine: hic ulla ex arbore generat
Insitutumque docet insive locutus.

is as correct a description of the operation called budding as any modern could give in so many words; and it is impossible that such operations should have been known without a much more large and accurate knowledge of vegetable physiology than it is generally believed that the ancients possessed.

From this time forward all inquiry into matters of science tended to decline; under the last Roman emperors science became gradually extinguished; under the Byzantine princes it can scarcely be said to have been preserved, and the little attention it subsequently received from a few obscure writers rather hastened than arrested its downfall.

Upon the revival of science in Europe the writings of the classical and Arabian herbalists were taken as the text-books of the schools, but their errors were multiplied by false translations, their superlatives were admitted without question, and so little was added by the monks authors, that between the time of Ebn Beithar, who flourished in the thirteenth century, and the year 1532, when the _Herbarum vivae icones_ of Othon Brunsleis, a Bernese physician, made their appearance, scarcely a single addition had been made to the slender stock of knowledge of about 1400 species, which are contained in the _Spongeleria_ of Spongelerius. The whole of the new material discovered the total amount discovered by all botanists, Greek, Roman, and Arabian, up to the day of Abdaliatif of Bagdad. Brunsleis describes the state of botany as being in his day most deplorable, as being principally in the hands of the most ignorant persons, and that the same names were sometimes employed as long and odd idiomatic names, disfigured by a multiplicity of barbarous,obsolete, and ridiculous names. He desires to be mentioned as the first reformer in this science, and as the earliest writer who earnestly endeavoured to purify the corrupted language of the _De spongeleria_ and other books in which barbarism from the antient Greek and Roman fountain. His example was speedily followed by Tragus, Fuchsius, Matthiolus, and others; the knowledge of species rapidly augmented, partly by the examination of indigenous plants and partly by the remarks of the earlier travellers, who about the year 1460 began to turn their attention to the vegetable kingdom; till at last their abundance became so great as to call for the assistance of compilers capable of digesting what and already begun to be scattered through numberless works. In this kind of work the first undertakers were those natives of Zürich, who died in the year 1565. This excellent man spent the latter part of his life in collecting materials for a general history of plants; he is stated to have caused above 1500 drawings to be prepared for the purpose, and succeeded in bringing together the discoveries before his project was executed, and his materials were afterwards dispersed. He appears however to have brought about one most important change in science, by discovering that the distinctions and true nature of plants were to be sought in their organs or natural relations rather than in those of nutrition. This was assuredly the first step that had been taken forward in the science since the fall of the Roman Empire, and is abundant evidence of the great superiority of Gesner over all those who had preceded him.

The Second Era.—Matthew Lobel, a Dutch physician residing in England in the time of Elizabeth, that the honour is to be ascribed of having been the first to strike out a method by which plants could be so arranged that those which are most alike should be placed next to each other, or in other words, which might be more easily distinguished of their natural relations. As may be supposed, this early attempt at the discovery of a natural system was exceedingly rude and imperfect; it is however remarkable for
having comprehended several combinations which are recognized at the present day: Cucurbitaceae, Stellateae, Gramineae, Labiate, Boraginaceae, Leguminosae, Ficeae, were all delineated by Linnaeus: it may be said that under the name of Asphodelus he grouped the principal part of modern petaloid monocotyledons. The reasons however why such groups were constituted were not then susceptible of definition; the true principles of classification had to be elicited by the study of evidence and facts. The great advantage of evidence, the foremost to take up this important subject was Celsus

The Fourth Aria—John Ray, a man of a capacious mind, of singular powers of observation, and of extensive learning, driven from his collegiate employments by the infamous conduct of his students, was for a time in the society of botanists, some of whom he was acquainted with; he then travelled among the forests of the world, and there he found the discovery of the two great natural classes into which the flowering part of the vegetable kingdom is now divided. Botany he found was fast settling back into the chaos of the middle ages, partly beneath the weight of undigested materials, but more from the want of some fixed principles by which the knowledge of the day should be gathered, he set to work with a boldness little understood even by other vegetable anatomists, to which he added a great store of original observation, he is in his 'Historia Plantarum,' the first volume of which appeared in 1686, embodied in one connected series all the facts that had been collected concerning the various parts of plants, he explained in a system which he followed for the object of classification, as indicated partly by human reason, and partly by experience; and from the whole he deduced a classification which is unquestionably the basis of that which, under the name of Linnaeus, has been so long recognized at the present day. For proofs of this, we refer our readers to the memoir of Ray in the present work: we will only observe in this place that he separated flowering from flowerless plants; that he divided the former into monocotyledonous and dicotyledonous; that he arranged various orders and families in their natural classes; and that he arranged a considerable number of groups, partly by himself, partly taken from Lobel and others; which are substantially the same as what are received by botanists of the present day under the name of natural orders. It is singular enough that the merits of this arrangement of John Ray should have been so little appreciated by his contemporaries and immediate successors, as to have been but little adopted; and that, instead of endeavouring to correct its errors and to remove its imperfections, botanists have been induced to commit the same imprudence as those who, at discovering other systems, the greater part of which were abandoned almost as soon as they were made known. Rivinus, Magnol, Tournefort, and Linnaeus were the most celebrated of these writers; but the two last alone have held any permanent place among the systematists. Linnaeus, for a long time stood at the head of the French school of botany, and in 1694, a method of arrangement, in its principles entirely artificial, but which in some cases was accidentally in accordance with natural affinities. It was founded chiefly on differences in the arrangement of the slightest reference to physiological peculiarities; and is now forgotten, except in consequence of its having furnished some useful ideas to Jussieu, as will be hereafter shown.

The Fifth Aria—Linnaeus was a genius of a different and a higher order. Born in 1707, he became a pupil of Struyck, and accosted from his earliest youth with those refined and minute investigations, all other things verbal accuracy and a logical precision, which are often most seductive when least applicable; endowed by nature with a most brilliant understanding, and armed by constitutional strength, of any fatigue either of mind or body, this extraordinary man set himself to produce a revolution in botany, among other branches of natural history, which in some respects advanced and in others retarded its progress far more than the acts of any one who had preceded him. He found the phraseology had been, he thought, the stumbling-block to the progress of science; he considered it, he said, a great impediment to the advancement of learning; and it is quite surprising to look back on these days from the present high ground on which botany has taken its stand, and to see how little the views of Great at least have subsequently required correction. From him physiological botany, properly speaking, took its origin. Clear and distinct ideas of the true causes of vegetable phenomena gradually prevailed, and the method of investigating them was so well established, that the minute parts through whose combined action they are brought about; and a solid foundation was laid for the theories of vegetation which subsequent botanists have produced: to Great may also be ascribed the honour of having first determined the powers of life to be distinct from those of reproduction, and to have shown the analogy between plant and animal life. For the foundation of the true principles of classification, and thus to commence

The Fourth Aria—John Ray, a man of a capacious mind, of singular powers of observation, and of extensive learning, driven from his collegiate employments by the infamous conduct of his students, was for a time in the society of botanists, some of whom he was acquainted with; he then travelled among the forests of the world, and there he found the discovery of the two great natural classes into which the flowering part of the vegetable kingdom is now divided. Botany he found was fast settling back into the chaos of the middle ages, partly beneath the weight of undigested materials, but more from the want of some fixed principles by which the knowledge of the day should be gathered, he set to work with a boldness little understood even by other vegetable anatomists, to which he added a great store of original observation, he is in his 'Historia Plantarum,' the first volume of which appeared in 1686, embodied in one connected series all the facts that had been collected concerning the various parts of plants, he explained in a system which he followed for the object of classification, as indicated partly by human reason, and partly by experience; and from the whole he deduced a classification which is unquestionably the basis of that which, under the name of Linnaeus, has been so long recognized at the present day. It was founded chiefly on differences in the arrangement of the slightest reference to physiological peculiarities; and is now forgotten, except in consequence of its having furnished some useful ideas to Jussieu, as will be hereafter shown.

The Fifth Aria—Linnaeus was a genius of a different and a higher order. Born in 1707, he became a pupil of Struyck, and accosted from his earliest youth with those refined and minute investigations, all other things verbal accuracy and a logical precision, which are often most seductive when least applicable; endowed by nature with a most brilliant understanding, and armed by constitutional strength, of any fatigue either of mind or body, this extraordinary man set himself to produce a revolution in botany, among other branches of natural history, which in some respects advanced and in others retarded its progress far more than the acts of any one who had preceded him. He found the phraseology had been, he thought, the stumbling-block to the progress of science; he considered it, he said, a great impediment to the advancement of learning; and it is quite surprising to look back on these days from the present high ground on which botany has taken its stand, and to see how little the views of Great at least have subsequently required correction. From him physiological botany, properly speaking, took its origin. Clear and distinct ideas of the true causes of vegetable phenomena gradually prevailed, and the method of investigating them was so well established, that the minute parts through whose combined action they are brought about; and a solid foundation was laid for the theories of vegetation which subsequent botanists have produced: to Great may also be ascribed the honour of having first determined the powers of life to be distinct from those of reproduction, and to have shown the analogy between plant and animal life. For the foundation of the true principles of classification, and thus to commence
scheme of the most specious aspect, in which all things seemed as clearly circumscribed by rule and line as the field of the sciences was to him. He had given the mastery over nature upon him, that he had discovered a mighty spell that would bind her down to be dissected and anatomized, and the world believed him; in short, he seized upon all the wardrobe of creation, and his followers never doubted that the puppets which he set in action were really the divine soul and language, notwithstanding all its meddlesome pedantry.

Such Linnaeus; the mighty spirit of his day. Let us do this great man that justice which exasperation on the one hand, and detraction on the other, have too often refused to him; and let us check this character soberly and without prejudice. We shall then admit that it was really united with its interior; and that he richly merited that high station in science which he held for so many years. His verbal accuracy, upon which his fame greatly depends, together with the remarkable terseness of his technical language, reduced the crude matter that was stored up in the folios of his predecessors into a form that was accessible to all men. He separated with singular skill the important from the unimportant in their descriptions. He arrayed their endless synonyms with a patience and lucid order that were quite imitable. By requiring all species to be capable of a rigorous definition not exceeding twelve words, he purified botany of the endless varieties of the gardeners and herbalists; by applying the same strict principles to genera, and reducing every character to its differential terms, he got rid of all the cumbrous and detritive jargon of the creation by imitation. With the colossal magnitude of an artificial system, every division of which was defined in the most rigorous manner, he was able so to classify all the materials thus purified and simplified, that it seemed as if every one could become a botanist without more previous study than to consult the index; and the words he used were words in a dictionary. Add to all this, the liveliness of his imagination, the skill with which he applied his botanical knowledge to practical objects, and the ingenuity he showed in turning to the purposes of his classification the newly-disclosed objects; in short, the wide range which was necessarily given to what it was that existed Linnaeus so far above his contemporaries. But great as the impulse undoubtedly was which Linnaeus gave to botany, there were vices in his principles which, although overlooked during his life, have subse-

quent discussion. It is evident that the question with which they were intended: hence arose a new source of confusion, inferior only to that which it was intended to correct. Differential characters, which would be invaluable if we had all nature before us, were found essential to a description of the Linnaean system; and then the calculation: they also laboured under the great fault of conveying no idea whatever of the general nature of the plants to which they related: thus the Portuguese botanist Loureiro, who attempted to determine the plants of China by the systematic writings of Linnaeus fell into the singular error that the hydrangea was a primrose. With regard to his artificial system of classification, it was found that it looked better in the closet than in the field; that the neatness and accuracy of the distinctions upon which it was divided into positions became of little avail upon new observations without end encumbered it at every turn. This, which is perhaps inseparable from all systematic arrangements, would not have been felt so greatly an evil, if there had been any secondary characters by which the primary ones could be checked, or if the system had really led with all its difficulties to a knowledge of things. But it was impossible not to perceive that it led in reality to little more than a knowledge of names, and that it could be looked upon as nothing beyond an index of general names and species. Let us refer in due course to these periods of the development of the time of Linnaeus; the force of many of them was hardly felt, when scarcely a twelfth part of the species now known to exist was upon record; and the world was naturally inclined to embrace with ardour the clearness and precision of this system, in the absence of any sufficient material for criticism; in exchange for the cumbersome, vague, and unmethodical descriptions of those who preceded it. The great evil that has arisen out of the system of Linnaeus has been this: that it has led to the formation of a large school of superficial botanists; of men who supposed that nomenclature and verbal criticism constitute the whole objects of less importance: the students of the unimportant; of men more for their total neglect of everything beyond this technical etymology than the old botanists for their disregard of the latter; who have had no general views, and apparently no power of applying their means to any intelligible end, and who, consequently, in the countries where they have flourished, have so far as the science of botany is concerned, made no progress; and as much to retard its progress as Linnaeus did to advance it.

The maxims however of Ray, and the great general views of that illustrious naturalist, were destined not to fade even before the meteoric brilliancy that surrounded the throne of Linnaeus. As Linnaeus himself entered the field of botany, soon entered the field to oppose the latter. In the year 1789, just eleven years after the death of Linnaeus, he produced, under the name of 'Genera Plantarum,' an arrangement of plants according to their natural relations, in which the principles of the great English botanist are tacitly admitted, and his fundamental divisions adopted in combination in part with those of Tournefort, and in part with what are peculiar to the author himself. Jussieu possessed in a happier degree than any man that has succeeded him the art of adapting the simplicity and accuracy of the language of Linnaeus to the exigencies of science, without encumbering himself with its pedantry. He knew the impossibility of employing any single characters to distinguish objects so variable in their nature as plants; and he clearly saw what a success all those attempts had been, without Without pretending then to the conciseness of Linnaeus in forming his generic characters, he rendered them as brief as was consistent with clearness; without peremptorily excluding all distinctions not derived from the fructification, he nevertheless left the whole system of the Linnaean division: instead of defining his classes and orders by a few artificial marks, he formed them from a view of all the most essential parts of structure; and thus he collected under the same divisions all those plants which are nearly alike in that respect. The divisions of the system of Linnaeus do not by any means lead to that of another in the system of Jussieu, it leads directly to the knowledge of many more in the classification of Jussieu; which has accordingly gained the name of the natural system. This last, like the former, has certain forms of leaves and modifications of other parts of plants that appear very different, as the angular leaves in the round cotyledons or seminal leaves of that plant. Linnaeus himself had entertained the opinion that all the parts of a flower are mere modifications of leaves; but Jussieu has always kept the terms of the plant (Genera Plantarum); Ludwig in 1757, and more especially Wolf in 1768, had stated in express terms that all the organs of plants are reducible to the axis and its appendages, of the latter of which the leaf is to be taken as the universal type. For the theoretical work of Jussieu was a very able and able writer of little authority in his day to succeed in establishing a doctrine so much at variance with received opinions; and the theory of Wolf was propounded in a paper upon the formation of the intestines in animals, which
seems altogether to have escaped the observation of botanists. Entirely unacquainted with the writings of the two latter naturalists, but aware of the Prolepis Plantarum of Linnaeus, Goethe took up this important theory, and demonstrated that all those organs to which so many different names and duties, which in the present century of botany had so many different functions to perform, were all modifications of one common type—the leaf; that the bract is a contracted leaf, the calyx a combination of several, the corolla a modification of several more in a coloured state, the stamens contracted and condensed leaves, and the ovary an axis in a state of differentiation, and the pistil another arrangement of leaves rolled up and combined according to certain invariable laws. All this he stated in such clear and precise terms, the arguments upon which he supported his propositions were so simple and so just, and the whole philosophy was explained in a tone so scientific and so philosophical, that no peculiarity of its not having been immediately received all over the scientific world shows in the clearest light how baneful the influence of Linnaean botany had already become; for this beautiful theory, which is the very cornerstone of structural botany, and which is now on all hands admitted to be unassailable, was treated as the idle dream of a poet, and neglected for above twenty years. It has however wrought a change in the ideas of mankind regarding the nature of plants which has already produced the most decided and the most beneficial results by helping to dispel the complicated and unintelligible distinctions and descriptions with which botany was formerly encumbered, by fixing the manifold combinations of the organs of plants at their true value, and by introducing more just ideas of vegetable physiology.

Here we must bring our sketch of the history of botany to a close. There is no longer any great discovery to announce as having produced a sudden and universal change in the science; its general principles are apparently well understood, and the botanists of the present century have been able to do has been to work out those principles in detail, to substantiate or modify them by isolated observations, to combine into one consistent whole the multitude of species whose attributes are as numerous as themselves, and to work them into harmony under the seemingly discordant materials which constitute the vegetable kingdom. The rapidity with which this has been effecting of late years has been in proportion to the disappearance of the Linnaean school; where the system of Linnaeus has continued to prevail, as in Sweden, Spain, Portugal, and Italy, progress has been the slowest; where it has only maintained a doubtful struggle with the principles of Ray, as in Germany and England, advance has been more rapid; but it has only been in France, in which the doctrines of Linnaeus never could be established, that the march of science has been steady and uninterrupted. At the present moment Great Britain, Germany, and France are in the same position; they are all freed from the prejudices of the Swedish school, and are proceeding with equal steps, all guided by the same sound and recognized principles.

The useful purposes to which botany is applied are so numerous, that we can only find room for a short explanation of the most remarkable. Agriculture and horticulture are the two arts with which its relation is the most obvious, though a close connection exists in each of them which grew out of mere experience, or was discovered by chance, yet there is no possibility of improving them except by other fortunate accidents, or of advancing them at a more rapid rate until the application of the principles of vegetable physiology. This is a part of it to which these arts belong, is little accoutumé to trace to their source the common practices with which it has been familiar from its infancy; and it is far from suspecting that many of the operations which are intrusted to the work of nature, have only been hit upon during the careful study of nature by philosophers whose names it never heard. Gardening and husbandry may be defined as the arts, firstly, of improving the quality of various useful plants, and, secondly, of increasing the quantity which a given space of earth is capable of producing.

To improve the quality of any one plant, and to render it better adapted to the uses of mankind upon scientific principles, is a very complicated process, and is to be effected in many different ways, all of which require an intimate knowledge of the nature of the vital actions of plants, and of the degree in which they are affected by either external or internal causes. For example, a particular kind of flax produces fibres which are too coarse for the manufacturer; it is impossible to know how those delicate elementary tubes are to be rendered finer without being aware of the manner in which they are formed, or of the conditions which influence their formation. The flavour of some fruit is too acid; it is the botanist only who could have discovered how to increase the quantity of saccharine matter. Potatoes are sometimes watery and unfit for food; we learn from vegetable physiology that this state of the vegetable is due to a ductless condition of the leaves, or that the potato is originally formed, not being sufficiently exposed to solar light, the great agent in causing the production of vegetable secretions. The leaves of the tea plant are harmless and only slightly stimulating in certain latitudes, but in the tropics become more or less excited in others; this apparent puzzle is explained by the connexion that exists between climate and vegetation, a purely botanical question. Certain races of plants may exist, of which one is too vigorous, the other too debilitated for the purposes of the cultivator; the botanist shows how an intermediate race may be created, having the best qualities of both.

Certain vegetable productions are susceptible of being produced in particular latitudes, others are not, or not to any useful purpose: for instance, in England the vine will never produce grapes capable of making such wine as even that of champagne, nor will tobacco within the limits of the temperate climate which gives it so great a value if grown in other countries; and yet both these plants flourish in the soil of England. The botanist can explain why this is, and thus prevent the commencement of speculations which can never end, but only end in loss and disappointment.

The quantity of produce which may be procured from a given space of ground varies very much according to the skill of the culturist, but that skill is in reality the mere application of the rules of vegetable physiology to each particular case; an application which must frequently make itself unconsciously, but which nevertheless is made. We are too apt to overlook causes in effects, and to ascribe the improvements we witness to a mere advance in art, without considering that that advance must have had a cause, and that that cause must in the last place be the working of some law, which is afterwards blindly followed by the community. The crops of orchard fruit are doubled and trebled in many places; old exhausted races are replaced by young, vigorous, and prolific ones; the cider and perry farmer will feel the benefit of this, but he will forget that he owes the change to the patient skill of a vegetable physiologist. The produce of the potato is augmented in the same proportion; twice at least the ordinary quantity of this important article of food may now be obtained from every field; the peasant would not feel this, yet he can only be the working of some law, which is afterwards blindly followed by the community. The crops of orchard fruit are doubled and trebled in many places; old exhausted races are replaced by young, vigorous, and prolific ones; the cider and perry farmer will feel the benefit of this, but he will forget that he owes the change to the patient skill of a vegetable physiologist. A Glossary of the Technical Terms most commonly employed in Botany.

Arida, the beard or awn of grasses.
Arisi, the case in which the spores of lichens are enclosed.
Aridicum, a hollow leaf looking like a water lily.
Aridum, having to do with the desert.
Aristae, the antennae or fore legs of insects.
Arista, the root and stem either taken together or separately.
Arista, the point or tip of a leaf, or the tip of a beak.
Aristeum, the flower-bud.
Aristeum, the outer layer of petals.
Aristeum, the inner layer of petals.
Aristeum, the outer sepals of a flower.
Aristeum, the inner sepals of a flower.
Aristeum, the outer style of a flower.
Aristeum, the inner style of a flower.
Aristeum, the outer stamen of a flower.
Aristeum, the inner stamen of a flower.
Aristeum, the outer carpel of a flower.
Aristeum, the inner carpel of a flower.
Aristeum, the outer ovule of a flower.
Aristeum, the inner ovule of a flower.
Aristeum, the outer ovary of a flower.
Aristeum, the inner ovary of a flower.
Aristeum, the outer calyx of a flower.
Aristeum, the inner calyx of a flower.
Aristeum, the outer corolla of a flower.
Aristeum, the inner corolla of a flower.
Aristeum, the outer anther of a flower.
Aristeum, the inner anther of a flower.
Aristeum, the outer filament of a flower.
Aristeum, the inner filament of a flower.
Aristeum, the outer stamina of a flower.
Aristeum, the inner stamina of a flower.
Aristeum, the outer stamen of a flower.
Aristeum, the inner stamen of a flower.
Aristeum, the outer carpel of a flower.
Aristeum, the inner carpel of a flower.
Aristeum, the outer ovule of a flower.
Aristeum, the inner ovule of a flower.
Aristeum, the outer ovary of a flower.
Aristeum, the inner ovary of a flower.
Aristeum, the outer calyx of a flower.
Aristeum, the inner calyx of a flower.
Aristeum, the outer corolla of a flower.
Aristeum, the inner corolla of a flower.
Aristeum, the outer anther of a flower.
Aristeum, the inner anther of a flower.
Aristeum, the outer filament of a flower.
Aristeum, the inner filament of a flower.
Aristeum, the outer stamina of a flower.
Aristeum, the inner stamina of a flower.
Aristeum, the outer stamen of a flower.
Aristeum, the inner stamen of a flower.
Aristeum, the outer carpel of a flower.
Aristeum, the inner carpel of a flower.
Aristeum, the outer ovule of a flower.
Aristeum, the inner ovule of a flower.
Aristeum, the outer ovary of a flower.
Aristeum, the inner ovary of a flower.
Aristeum, the outer calyx of a flower.
Aristeum, the inner calyx of a flower.
Aristeum, the outer corolla of a flower.
Aristeum, the inner corolla of a flower.
Aristeum, the outer anther of a flower.
Aristeum, the inner anther of a flower.
Aristeum, the outer filament of a flower.
Aristeum, the inner filament of a flower.
Aristeum, the outer stamina of a flower.
Aristeum, the inner stamina of a flower.
Aristeum, the outer stamen of a flower.
Blungs, in two pairs, placed end to end
Bino, growing in pairs
Biparite, divided into two deep lobes
Bipinnate, twice pinnate
Baserrate, twice serrate
Brachiate, when branches stand nearly at right angles to the stem from which they spring
Broot, the leaf or leaflet from the axil of which a flower grows
Bulb, a scaly, underground bud
Budshaker, a short, roundish, underground stem resembling a bulb
Caducous, falling off sooner or later
Camara, of a bluish grey colour
Carpelled, growing in tuffs
Carea, a spur or horn; s. in the nasturtium
Carinate, having a spur or horn
Carpospermium, a collection of bracts on the outside of a calyx, or of an involucre
Calyx, the hood of a cloak
Calyx, the external envelope of a flower
Combium, a viacid secretion formed in the spines between the bark and wood of Exogens
Compositae, bell-shaped
Cormiculata, channelled
Conceleulate, a leaf which has veins without connecting parenchyma
Crepis, growing in a head
Cupulatum, a collection of flowers in a head
Capsule, any dry many-seeded fruit
Carinate, having a kind of keel
Carpa, a flat or conical receptacle
Carpel, one of the parts of a compound pistil; a single leaf rolled up into one of the stamens of a pistil
Carpellate, a seed having fungous excrements growing near its hilum
Carpogynium, a dry one-seeded fruit resembling a seed, but with no distinction between the seed coat and pericarp
Cudate, prolonged into a sort of tail
Cultrate, of or belonging to the stem
Cymuline, resembling a cyme
Chalaza, a spot on a seed indicating the place where the nucleus is united to the seminal integuments
Clavate, fringed with hairs like an eyelash
Concinereus, ash-coloured
Clavinate, rolled inwards from the point to the base
Clavato-cycadina, dividing into two parts by a spontaneous transverse separation
Ceratobus, terminating in a tendril
Cycladenia, a large composite
Claviform, like the stalk of a petal
Clavipetalum, resembling a round buckler
Cochlailate, resembling the bowl of a spoon
Coelocaulon, the place where the stem and root are combined
Colamea, a central part of the fruit of a moss, round which the spores are deposited
Column, the combination of stamens and style in Orchis and other plants
Comose, having hairs at one or both ends, if speaking of seeds; being terminated by coloured empty bracts, if applied to inflorescences
Conspicuous, doubled together
Curvifolium, growing together so that the line of junction is lost to the sight
Curvifoliate, growing in pairs
Curvirostrum, growing together so that the line of junction remains perceptible
Connective, the fleshy part that combines the two lobes of an anther
Convergent, mycelium, as the anther of a potato blossom
Comatose, approaching a conical form
Continuous, proceeding from something else without interruption
Contorted, twisted in such a way that all the parts have a similar direction, as the segments of the flower of an Olerander
Corymbus, rolled together
Coredium, the rudimentary axis which connects the corydiloes of the embryoid
Coredìs, heart-shaped
Coriaceous, of a leathery texture
Cormus, a solid, roundish, underground stem, as in Crocus
Coriaceous, of a hardy texture
Coreniculate, shaped like a slender horn
Corolla, the second of the two envelopes that surround the stamens and pistil
Corolla, a combination of Barel and barren stamens into a disk, as in Stapelia
Corymbose, when the branches surrounding a common axis are shortest at the top and longest at the bottom, so as to form a level-topped whole
Costa, the midrib of a leaf
Cotyledons, the leaves of the embryo
Corymbose, shaped like a goblin
Crenulat or Crenat, having rounded notches at the edges
Crenate, having some unusual and striking appendage arising from the middle
Cruscata, when four parts are so arranged as to resemble the arms of a Maleine
Oscillata, hooded, rolled inwards so as to conceal anything lying within
Calm, the straw of grasses
Coneate, wavy or semicircular
Capule, the cup of the scar, the husk of the fiblert, chestnut, &c.; a peculiar combination of bracts
Crepis, abruptly rounded off with a projecting point in the middle
Cistle, the external skin
Cystiform, cup-shaped, more contracted at the orifice than the crateriform
Cyne, an inflorescence having a corymbose form, but consisting of repeatedly-branched divisions
Cymiform, having the form of a boat
Cymes, resembling a cyme in appearance
Decandrous, having ten stamens
Deciduous, falling off
Declinate, curved downwards
Decumbent, lying prostrate, but rising again
Dendriform, the leaf produced downwards, as the base of a leaf the stem of the flower
Declinate, crossing at right angles
Deliquescent, the act of opening of anther or fruit
Deltoid, having the form of a triangle or Greek Δ
Dendriform, resembling a small tree
Denticulate, with sharp-pointed notches and intermediate curves instead of re-entering angles
Diplostemon, imperfectly developed; looking as if ill-formed from want of sufficient nutriment
Depressed, flattened from point to base
Disporum, having the stamens in two parcels
Dissect, having stamens on one plant and pistils on another
Descendent, having two stamens
Disciform, repeatedly divided into two branches
Dicytobus, having two cotyledons
Diosmamos, having two pairs of stamens of unequal length
Diosmamus, growing in pairs, or twins; only applied to solids and not to flat surfaces
Dioecious, having a clear distinction of a common centre, as the fingers from the palm
Dimidiate, half-formed, or halved, or split into two halves
Dipteros, having two wings
Discus, with the central part of a flat body differently coloured or marked from the marginal
Disk, a fleshy circle interposed between the stamens and pistils
Disperimenata, the vertical partitions of a flower
Dichotoma, arranged in two rows
Dichrointering, diverging at an obtuse angle
Dodecandrous, having 12 stamens
Dodeciflorus, hatchet-shaped
Drope, such a fruit as the peach, consisting of a stem surrounded by flesh or fibrous matter
Doxe, spiral vessels that will not unroll
Dormose, having a compact bushy form
Duramen, the heart-wood of timber
Dekhana, covered with hard sharp points
Elaeora, little spirally-twisted hygroscopic threads that disperse the spores of Juniper
Elementary organs, the minute parts of which the texture of plants is composed
Emarginatae, having a notch at the point
Ephemere, an ephemeral plant before germination commences
Endocarp, the hard lining of some pericarps
Endogen, a plant which increases in diameter by addition to its centre, as a palm-tree
Encondrous, having 9 stamens
Ensiform, having the form of a straight and narrow sword blade
Epicharp, the external layer of the pericarp
Epoxydine, the skin of a plant, in the language of some writers; the cortical integument according to others
Epimorph, growing upon the top of the Californian; or, as we now do so
Equisetum, when leaves are so arranged that the base of each is enclosed within the opposite base of that which is next below it; as in Lepidostrobus
Evisceration, see Evisceration
Exogen, a plant which increases in diameter by the addition of new wood to the outside of the old wood; as an oak-tree
Fereinaceae, mealy
Paniculate, banded
Paniculate, collected in clusters
Patsilis, when the branches of any plant are pressed close to the main stem, as in the Lomandra
Filament, the stalk of the anther
Filiform, slender and round like a thread
Filiform, tubular but closed at each end; as the leaf of Eremurus
Flabellifer, fan-shaped
Flagelliform, resembling the thong of a whip
Flavoran, wavy
Floccoso, covered with little irregular patches of wool-like hairs
Flax, a weaver's flower
Floccule, little
Flocculos, having the colour and texture of a common green leaf
Folicula, the arrangement of young leaves within the leaf-bud
Folicle, a simple fruit opening by its ventral suture only
Fomal, the passage through the integuments of an ovule by which impenetrating matter is introduced into the nucleus
Fomitum, the fertilizing principle of pollen
Prand, the leaf of a fern or of a palm
Fruit, the full-grown ripened pistil
Fuscos, lasting but a short time
Fusiform, resembling a fungus; that is, irregular in form and fleshy in texture
Funiculus, the stalk by which some seeds are attached to the pericarp
Fusiform, spindle-shaped, thickest in the middle, and tapering to each end
Galbulus, a small cone whose scales are all consolidated into a fleshy ball, as in Juniper
Galax, the upper lip of a liliaceous flower
Galactose, kneeded, when a stem bends suddenly in its middle
Gobbius, prominent, projecting
Glabrour, having no hairs
Glabrous, the same as acaule, but broader and shorter
Gland, 1. the fruit of the oak, the hake, &c.; 2. an elevation of the cuticle which usually secretes either acidic or resinous matter
Glandular, covered with glands of the second kind
Glaucesc, covered with bloom like a plum
Glauchitide, covered with hairs which are rigid and hooked at their point
Glauco, one of the bracts of grasses
Gymnospermous, having seeds which ripen without being enclosed in a pericarp
Gymnospermous, having seeds which ripen without being enclosed in a pericarp
Gynangia, an elevated part of the growing point of a flower-bud, rising between the carpels and throwing them into an oblique position
Gynandrous, having 6 stamens
Hilum, the scar left upon a seed when it is separated from the placenta
Hilum, covered with harsh long hairs
Hymenium, the gills of a mushroom; that part in Fungi where the spores are placed
Hydrocotyleform, salver-shaped; having a cylindrical tube and a flat border spreading away from it
Hypogynous, arising from immediately below the pistil
Hypospandrous, having 20 or more perigynous stamens
Infracticollumn, overlapping, as tiles overlap each other on the roof of a house
Incurvature, lying upon any thing
Intedunculate, not opening when ripe
Interdulcate, doubled inwards
Integumentum, the membrane that overlies the pericarp
Inferior, is said of a calyx when it does not arise from the ovary; is said of an ovary when it does adhere to the calyx
Inflorescence, the collection of flowers upon a plant
Involucriform, shaped like a funnel
Involucrum, growing upon any thing by one end
Involucrom, the young shoots of mimosas
Intercelular, that which lies between the cells or elementary bladders of plants
Intramural, the space between two nodes
Interrupted, when variations in continuity, size, number, excel, or are different in the parts which are sometimes uniform; as when pinnate leaves have the alternate leaflets much the smallest, and when double spikes are here and there broken by the extension of internodes
Involucres, a collection of bracts placed in a whorl on the outside of a calyx or flower-head
Involute, rolled inwards
Labelatum, one segment of a corolla, which is longer than the others, and often peniculate
Labiata, divided into an upper and a lower lip, as the corolla of dead nettle
Loculicidal, a flower having one cavity; that is, ovuliferous to both extremities
Lateral, originating from the side of anything
Lobate, the vital fluid of vegetation
Lobate, not compact or dense
Leaflet, a division of a leaf
Legume, a kind of fruit like the pod of a pea
Lenticellate, small, depressed, and doubly convex
Lepidote, covered with a sort of scurfiness
Leprous, the same
Lepotrichia, a newly-formed inner bark of Exogona
Ligula, a membranous expansion from the top of the petiole in grasses
Limb, the blade or expanded part of a petal
Linear, very narrow, with the two sides nearly parallel
Lip, see Labelatum
Loculicidal, when the carpels of a compound fruit dehisce in such a way that the cells are broken through at their back
Loculicom, the spiket, or collection of flowers of a grass
Lomentum, a legume which is interrupted between the seeds, so as to separate into compartments
Lomatium, formed like a crescent
Monocarpate, when hairs are interwoven into a mass that can be easily separated from the surface
Marginal, of or belonging to the edge of a thing
Medallary, of or belonging to the pith
Microsporium, a small passage through the seed, called the foramen when speaking of the ovule
Microsporangium, conical, hollow, open at the base, and either entire there or irregularly cut
Monadelphous, with the stamens united into one body
Monandrous, with one stamen only
Monosiphon, shaped like a necklace
Monopetalous, with several petals united into one body by their edges
Monocotyledon, tipped by a hard point
Monofid, divided into many shallow lobes
Monolepis, divided into many deep lobes
Monocotyledon, covered with short, broad, sharp-pointed tubercles
Mormifera, resembling the bricks in the wall of a house
Navelier, shaped like a very small boat
Nectar, any organ that secretes honey
Nervus, the stronger veins of a leaf
Node, the part of a stem from which a normal leaf-bud arises
Normal, according to general rules
Nucellus, the central part of an ovule, or a seed
Nucula, a small hard seed-like pericarp
Nobilis, larger on one side than on the other
Ochrea, two stipules united round the stem into a kind of sheath
Ochroma, having eight stamens
Ooecium, the lid of the theca of a moss
Ovary, the hollow part of a pistil containing the ovules
Ova, having the figure of an egg
Ovule, a rudimentary seed
Palate, the lower surface of the throat of a Nabathean corolla
Palaceous, oblong, narrowing towards the base, and contracted beyond the middle
Panicle, a compound racemes; a loose kind of inflorescence
Papilionaceous, a flower consisting of standard, wings, and keel, like that of a pea
Pappus, the calyx of a Composita, as of a thistle
Parsenchyma, the pulp that connects the veins of leaves
Parietal, growing from the lining of any thing
Pectinate, divided into long, close, narrow teeth like a comb
Pedate, palmate, with the lateral segments of the corolla
Pedicellate, from trusses having five stamens
Pedicel, one of a great many peduncles
Pediculae, a flower-stalk
Peduncle, attached with the margin
Pedunculate, having five stamens
Perfoliata, surrounding a stem by the base, which grows together where the margins touch
Petalium, a collection of floral envelopes, among which the calyx cannot be distinguished from the corolla, though both are present
Pericarp, the shell of a fruit of any kind
Perichetium, the leaves at the base of the stalk of the fruit of a moss
Pericarpium, same as Pericarp
Perigynous, growing from the sides of a calyx
Peristerm, same as albulum
Peristerma, same as albulum
Processus, a set of processes surrounding the orifice of the theca of a moss
Peronema, laid thickly over with a woolly substance ending in a sort of meal
Persoanea, labiate, with the palate of the lower lip pressing against the upper lip
Petiol, one of the parts of a corolla
Petiolate, resembling a petal in colour and texture
Petiolata, petiole, the stalk of a leaf
Petiolatus, or belonging to the petiole
Petiolum, a leaf transformed into a flat leaf-like body
Pileus, the cap of a mushroom
Pilous, covered with short fine hairs
Pinnate, divided into a number of pairs of leaflets; bipinnate, each leaflet is also pinnate; tripinnae, each secondary leaflet pinnated also
Pinnaed, divided in a pinnated manner nearly down to the midrib
Pistilus, the combination of ovary, style, and stigma
Pith, the central column of cellular tissue in an Exogena
Placentia, the part of the ovary to which the ovules are attached
Plane, quite flat
Plumula, the rudiment of a stem in the embryo
Pollin, the powder contained in an anther
Polld, the membranous tubes emitted by pollen after they fall on the stigma
Polydentalus, when the stamens are combined into groups of more than two parcels
Polygamous, when there are more than 20 hypogynous stamens
Polygalous, when the petals are all distinct
Pome, a fruit like the apple, pear, &c.
Prorification, same as Rservation
Prickle, same as aculus
Prime, the external integument of the ovule
Pseudobulb, the solid ground-grove tuber of some Orchidaceae
Pseudoceros, divided with very fine soft down
Pulverulent, covered with a powdery appearance
Pulmonae, same as Endocard
Pyriform, shaped like a pea
Quarine, the innermost integument but one of the ovule
Quinate, combined in fives
Quinate, the innermost integument of the ovule
Raceme, an inflorescence like that of the currant
Rachis, the axis of inflorescence
Radical, arising from the root
Rapha, having the rudimentary root in the embry
Ramen, soft, rough-edged, chaffy-like hairs growing upon the veins of ferns
Raphes, the line of communication between the hilum and chalaza
Raphides, acicular or other crystals scattered among the tissue
Reniform, kidney-shaped
Resupinate, inverted, so that the part which is naturally lowermost becomes uppermost
Restinga, having the veins having the appearance of network
Rhine, blunt, and turned inward more than obtuse
Rhinos, having a lining stem like that of Iris
Rigida, same as Persoanea
Root-stock, same as Rhiizoma
Rosulate, furnished with a sort of bead
Rosulate, having the leaves arranged in little rose-like clusters
Ruminated, pierced by numerous perforations full of chaffy matter like a suit of armour
BOTANY BAY is situated on the E. coast of Australia, which coast is commonly called New South Wales, but since the discovery of Cook’s Land, has been discovered by this great navigator in his first voyage. He entered Botany Bay and examined it as well as his short stay permitted. He found the bay capacious, safe, and convenient. The entrance is a little more than a mile broad, but the bay afterwards enlarges to about three miles in width. He describes the soil of it as that of light sand, and the face of the country as finely diversified by wood and lawn. The trees, he adds, are tall and straight, and without underwood, standing at such a distance from each other, that the whole country, at least where the swamp appears, is incapable of cultiva- tion without cutting down one of them; between the trees the ground is covered with grass, of which there is abundance. The great quantity of plants found there by the naturalists accompanying him in his first voyage disgrace the English botany. The bay is alternately contracted and distended.

In 1788 it was resolved to found in the southern hemisphere a penal settlement, and Botany Bay was thought the fittest place. Governor Phillip accordingly set sail for it, but was soon convinced that it was not suitable for settlement under great disadvantages. The bay indeed is extensive, and good anchorage is found in 4, 5, 6, and 7 fathoms water; but both on the N. and S. sides and on the bottom of the bay flats extend to a great distance from the shore, having only 4 or 5 ft. water on them. The river which falls into the bay at its W. extremity, and is now called George’s River, can only be navigated by boats. It was also found that the anchorage which lies contiguous to the entrance of the bay was in its whole extent exposed to E. winds, which, from the N.E. and S.E. quarter set in a prodigious sea. Governor Phillip therefore resolved to examine the neighbouring coast, in the hope of finding a more advantageous place for the new settlement. Not many miles to the north of Botany Bay he entered Port Jackson, a similar inlet, which was likewise discovered and named by Cook, who however did not think it worth his while to enter it, because it had the appearance of an open bay. Governor Phillip discovered on its southern shore excellent anchorage sheltered from all winds, and here he founded the settlement of New South Wales, which was called by him New South Wales, and was well named by Cook, who however did not think it worth his while to enter it, because it had the appearance of an open bay. Governor Phillip discovered on its southern shore excellent anchorage sheltered from all winds, and here he founded the settlement of New South Wales, which was called by him New South Wales, and was well named by Cook, who however did not think it worth his while to enter it.
ner of Claude (to whom only he has been considered inferior), and Andrew adorning his brother's scenes with figures in the style of Bamboccio. They continued in Italy working in concert until separated by death. There is much confusion among writers as to which died first. One of them was esteemed by falling into a canal at Venice, in the year 1650, returning late from a supper party; and the survivor then left Italy, and returned to settle at Utrecht. From the fact of his painting portraits and conversation pieces, it is most probable that Andrew was the survivor, and that in the landscape-painter, persisted in Italy. Andrew died six years after his brother, his end being hastened by grief.

The landscapes of John are glowing with colour and sunshine, and rich in beauty and natural effects; his handling is light, free, and facile, so that he sometimes painted without outlines. A fulness which without limit pervades his landscapes has been objected to; but in his best productions this fault is corrected. He has less studied elegance than Claude, and his pictures are more like common nature; but his composition is far less perfect, and his artifices less artfully concealed. The extreme beauty of his colouring however procured him the title, by which he is still known, of Both of Italy. The figures by Andrew are above all comparison superior to those of Claude; and the joint productions of the brothers, in which each laboured to set off the other, have ever been considered of the highest value.

Bothnia, or Bottena, is a name which was given at some remote period to the countries on both sides of the Gulf of Bothnia as far S. as the straits called the Quarken. It is used by the old Dutch sea-pilots to Eir; and the name, but the former has been ceded to Russia, and constitutes the greater part of the lately-erected government of Uelesborg.

Western Bothnia constitutes with Lapland the most northern portion of Sweden, and contains about three-eights of the whole surface. On the N. E. it is bounded by Russia, from which it is divided by the rivers Muonio-Elf and Torne-Elf. On the N. and N. W. the range of the Kielen (pron. Tiben) mountains separates it from Norway. On the S. It joins the Swedish provinces of Jamtland and Angermanland, and the remainder of its boundary consists of the Gulf of Bothnia. Its most N. point touches, or passes the sixty-ninth parallel, and the most S. lies nearly at equal distance from the sixty-third and sixty-fourth parallel. It extends from 14° 20' to 24° E. long. Its surface is calculated at 62,543 sq. m., or a little more than half the Irish lands.

This province contains the greatest plain in Sweden, which occupies the most northern part of it. It is properly speaking an inclined plane, which begins where the boundaries of Sweden, Russia, and Norway meet, and extends toward the south over the lowest levels of the country. The southern part of the plain runs along the boundary of Russia, it is about 1300 ft. above the level of the sea, and presents to the eye nearly a level surface covered with swamps and innumerable small lakes; between which a few small hills rise to 300 or 600 ft. The summits of these hills are covered with white reindeer moss, and between the lakes are bushes of dwarf birch. The country then lowers rapidly, and within 20 or 30 miles rises the study rocks, the trunk of a full grown tree, and soon mingles with the pine (pinus silvestris); lower down grows the fir (pinus abies). About half way towards the Gulf, and before the Muonio-Elf falls into the Torne-Elf, the country is less than 400 ft. above the sea. Then the plains again lower down, and the river becomes the chief object of the rivers, where agriculture has been introduced within a century and has made considerable progress, though the climate only allows the cultivation of barley, oats, and potatoes.

And between both banks of the Upper Torne-Elf some hills of considerable height rise on the plain. These hills are immense heaps of iron-ore, nearly useless to man on account of their situation.

The Torne-Elf rises in the lake of Tornea (Tornea-Trick), which is imbedded in the rocky mountains of the Kielen, and is 50 ft. in breadth of 10 m., its N. E. extremity being only about 15 m. from the Ocean. From this lake the river runs between the hills of iron-ore, forming numerous rapids and small cataracts, which however would not be an impassable obstacle to navigation, were it not for a cataract near its confluence with the Muonio, where the river, in a distance of about 1000 ft., descends 75 ft. in perpendicular height. The Muonio, which through its whole course is the boundary between Russia and Sweden, is called in its upper part the Kihonni, and is navigable for wind and sail to its mouth, though it has some rapids. Before the Torne-Elf turns to the E. to unite with the Muonio-Elf, it sends off a branch to the right called the Tarend€-Elf, which, after a tortuous course of about 30 m. to the S., joins the Calix-Elf forming an almost natural cataract between two river systems. The Torne-Elf runs upwards some 23 miles into the N. part of the Gulf of Bothnia, a few miles below the town of Torne.

The Calix-Elf rises at no great distance to the S. of Tornea-Trick in the Kielen mountains, whence it carries off many superficial rivers, the largest of which is the Muonio, running nearly parallel to the Torne-Elf E. S. E. for about half its course. Where it receives the Tarend€-Elf it turns to the S. and continues in that direction. It is less distant than the other large rivers of Bothnia; it reaches the most northern part of the Gulf of Bothnia after a course of nearly 250 m.

The country between the Calix-Elf and the Lulea-Elf forms the southern part of the plain, which may be considered as terminating near the south-west coast, where trapose rocks rise, which skirt its banks as far as its confluence with the Lilla (Little) Lulea-Elf. These high rocks are called Norra Ananas. In the middle of the plain between the Calix-Elf and Lulea-Elf, rises the Mount Dunderi, a not uncommon mountain, of Mount Dunderi and Norra Ananas, called Storna Maddus. It is a swamp, extending above 20 m. in every direction. The E. portion of the plain is partly covered with forest-trees, and cultivated along the water-courses, though its soil is rather indifferent, and much inferior to that on the other side of the Calix-Elf, except where it approaches the sea.

The Lulea-Elf is the most rapid of the rivers of Sweden and perhaps of Europe, a rival of the Glommon-Elf in Norway. Rising on the E. declivity of the Kielen Mountains it soon enters a succession of lakes, situated at different levels two and three, that separate the country into partly isolated basins, having rapidly cataracts of considerable height. Such is its course for about 100 m. when the lakes terminate, but the cataracts continue. Some miles after the river has left the last lake, its waters are narrowed by steep rocks on each side, and rush down 400 ft. in the space of less than 1 m. This most remarkable cataract is called Nuuamelsaakas (the hare's leap), where the vapours arising from the water are directly condensed and freeze in winter, forming a valet strong enough to afford a passage to hares. (Schubert's Reisen, p. 392.)

This river has its mouth in a part of Sweden, where two ranges of high rocks, of which the N., the Norra Ananas, is the highest; and here the solitary habitation is found about 120 m. from the boundary of Norway. Where the rocks terminate the river unites with the Lilla Lulea (Little Lulea), but even here its waters are of a different character. It traverses a succession of seven large lakes, which extend upward of 80 m. W. and E.; and after issuing from them runs above 20 m. before it joins the Lulea-Elf. Its bed lies in a deeper valley; it forms fewer cataracts and rapids, and its banks are inhabited in several places.

The country between the Lulea-Elf and Skelleftea-Elf is nearly equally divided between mountains and plains. In his part the Kielen range rises to its greatest height in Mount Sulitima, and extensive ranges of it are always
covered with snow. The ridges branching off from it E. extend from 60 to 80 m., and are divided by wide valleys, which in their upper parts rise above the line of the birch (2000 ft.), and are only covered with swamps and reindeer moss. In their lower parts forests of pines, fir, and birch are frequent, and the habitations of men soon begin to appear, but the soil is unfit for cultivation, except a few small patches. Even lower down, in the plain itself, the surface is generally flat, and the number of loose stones occurs. Along the water-courses the pasture is good, but in very few places can the soil be cultivated with advantage. About 60 m. from the shore, agriculture begins to be the principal occupation of the inhabitants, and villages are more numerous; but even here wood covers the greatest part of the country.

The Pitea-Elf rises in the extensive lake of Peskejasjo, which is enclosed by high mountain rocks, and running through the mountainous country in a S.E. direction, traverses many smaller lakes. Here it forms numerous rapids, and some considerable cataracts. In the plain it continues its S.E. course, but about 60 m. from the coast, it turns due E., and falls into the sea a little below the town of Pitea, after a course of about 180 m. It is only navigable a few miles from its mouth.

The Skelleftea-Elf rises in the N.E. declivity of the Nassa-fjall, in which there are some mines of silver, which since 1808 have not been worked. In the mountainous portion of the country, this river likewise traverses some considerable lakes, and receives the waters of others by numerous rapids, and it runs through a gorge, which soon turns to E.S.E., and continues in that direction to its mouth, below the church of Skelleftea. The rapids in this river are more numerous than in the others; but it has fewer cataracts, so that the salmon ascend nearly to its sources. The rapidity of the current and the church of Skelleftea, and of course the river is only navigable for a few miles above its mouth. Its course is about 180 m.

On the banks of this river the great plain of Bothnia extends, the country S. of it being entirely hilly or mountainous, and the level tracts few and of comparatively small extent. The hills cease at a small distance from the shores. Farther inland they rise into mountains, with declivities covered with forests, consisting chiefly of pine, birch, and fir. The level tracts along the rivers afford pasture, and are sometimes cultivated. Agriculture is carried on to a much greater extent in the E. and hilly parts of the country.

In this S. portion of Bothnia the mountains in the W. have four ranges, rather than groups. Some miles N. of 65° N. lat. a range branches off from the Kiolen chain, which running nearly E. traverses almost the whole of the Scandinavian peninsula, terminating about 30 m. W. of the mouth of the Umea-Elf. This range, called the Sjövalla-fjall, forms a barrier for several miles, though its summits are formed of barren rocks, the sides are clothed with fir, birch, and aspen, and afford good pasture.

To the N. of this chain runs the Oran-Elf, a considerable river, rising at some distance from the Kiolen and running nearly E., and parallel to the Stigfjall. It turns to the S.E., where this mountain-range terminates, and soon after enters Angermanland, where it still runs from 40 to 45 m., till it falls into the sea between the villages of Angerjö and Lefvar. Its whole course may be upwards of 150 m.

To the N. of the Oran-Elf runs the Umea-Elf, which rises in the Kiolen-range about 68° N. lat. It first runs S., traversing some lakes, and then turns to the S.E. and flows into the large lake of Stora Umea. It continues in the same direction till about 20 m. from the sea it is joined by the Windel-Elf, and falls into the gulf after a course of about 180 m. The Windel-Elf which rises in the Kiolen range, about 68° 30', on the S. declivity of the Nassa-fjall, and descends 150 m. Its course, with numerous rapids, is more free from cataracts than the other rivers of Bothnia. The Swedish government has in later times succeeded in rendering a considerable part of it navigable, at least so far that timber and wood may be floated down.

Both lakes, on both sides of the distant circle, have, of course, a very cold climate, though it is much milder than other parts of the globe in the same latitude. Winter lasts, in general, eight months, from the beginning of October to the end of May, and the cold is very severe. It is followed almost immediately by summer, a few moderate days only intervening between the frost and a great degree of heat. In the beginning of June all traces of winter have disappeared, and the summer vegetation is almost in full vigor, reduced by the long days of 18 or 20 hours, united to the moisture which has accumulated during the long winter, give rise to a very rapid vegetation. Corn is sown and reaped in some places in the course of seven or eight weeks, and now and then, in the neighborho of the towns. Nevertheless it is sometimes destroyed by night frost, which generally appears about the 20th of August for three or four nights in succession. These nights are called iron nights, and are followed by about six weeks of moderate favourable weather.

The quantity of snow which falls during the winter is very great; but in summer rain is scarce: which circumstance would be very injurious to the growth of grass, were it not for the inundations of the rivers. The rivers of Bothnia overflow the low tracts along their banks for a year; the first time in the beginning of June, after the melting of the snow in the lower parts of the country; the second towards the middle of July, when a succession of long months has produced the same effect on the mountains. The latter inundation is more favourable to the growth of grass than the former, and enables the inhabitants to gain a much larger stock of cattle during the eight winter months.

The soil is of an indifferent quality, sandy and stony, except along the Tormea-Elf and Muonio-Elf, where it is richer and better adapted to agriculture. The worst portion is that along both sides of the Luola-Elf, and the high valleys along the foot of the Kiolen. Along the shores of the gulf of Bothnia the land is much better, and the crops sufficient for the consumption of the inhabitants; but the Giileden is the most fertile of all. A certain quantity of corn is annually imported from Finland.

Wheat is only cultivated at one place, in the most S. corner of the province, and here hardly a few bushels are annually obtained. Rye is grown nearly up to 60° N. lat., and oats are grown to 66° N. lat. It has been cultivated only in the last forty or fifty years, succeed in most places very well; turnips and cabbages do not thrive.

Black cattle form one of the principal sources of wealth in the province, but the stock is limited by the scarcity of meadows; pasture-walks however are so extensive, that ten times the present number of cattle could easily be maintained in summer. Butter and hides, which are the principal articles of export, are sent to Stockholm. Horses are rather numerous, and of a middling size. Sheep are only found in the S. districts, and their wool is coarse. Hogs are not kept. The Laplanders have considerable herds of rein-deer, and live upon their flesh and other produce.

The inhabitants of the more inland districts gain their living chiefly by fishing in the lakes, which abound in many different species of fish. They eat the salmon in such quantity, that they have given it the name of lavaretus. The salmon ascends these rivers which have not high cataracts, and the number of fish taken is considerable.

The greatest part of the country is still covered with forests. Only the high plain between the Colix-Elf and Lulea-Elf rises above the line of the birch trees. This district and the upper parts of the mountains, with the highest valleys, are only covered with reindeer moss; the remainder forms nearly an interminable forest, especially in the inland districts. The granite, pine, fir, alder, and aspen. The birch grows to a stately tree on the banks of the Tornea-Elf. But it is observed that the growth of the trees is very slow, probably on account of the length of the winter. The inhabitants have hitherto derived very little advantage from this vast treasure, the rivers not being navigable even for floating down wood. In some parts along the coast tar and pitch are made for exportation, but in no great quantity.

Three nations inhabit Bothnia, the Finns, the Laplanders, and the Swedes. The Finns form the chief tribe along the banks of the Muonio-Elf and Tornea-Elf, where they form the bulk of the population. They apply themselves especially to the rearing of cattle, and are distinguished by their skill in the management of the dairy. The Laplanders inhabit the inland districts, the herds of reindeer in the summer to the upper valleys in the mountains, and even to Norway, but in winter they descend to the lower plains on the shores. Some of them have be-
come agriculturists, and partly adopted the manners and customs of the Swedes. The Swedes occupy the country along the shores, and extend always farther up into the valleys along the larger rivers. They occupy themselves more with admiring the scenery which here presents to their eyes, than with the inland districts, who gain their sustenance by fishing in the lakes.

Bothnia with Lapland is politically divided into two large districts, of which the S. is called Westerbothien, or Utenland, and the N. Nordenborg, or Pites Land. (Bothwell Travels; Schubert's Travels in Sweden; Maps of Baron Hermelin.)

BOTHNIA (the Gulf of), the most northern part of the Baltic Sea, extends from 60° to nearly 66° N. lat. Between 60° and 64° N. it lies due S. and N., but the remainder declines to the N.E. Its whole length may be nearly 450 m. Its entrance is formed by a strait called Aland Haf, which divides the Scandinavian pen. from the Aland Islands, that belong to the Russian government of Abo, a part of the ancient prov. of Finland. This strait is from 36 to 50 m. wide. North of it the gulf widens suddenly, the coasts of Sweden trending to the N.W., so that before it reaches 61° it has attained a width of upwards of 240 m.; which breadth it preserves nearly to 62°. Farther N. it narrows gradually, till near 64° it forms another strait, called the Quarken. That portion of the gulf extending from Aland Haf to the Quarken is called Bottniska Hafet (the sea of Bothnia). At the Quarken the coast of Sweden is hardly more than 60 m. from that of Russia, but the straits are still formed by a gulf bounded by the Swedish island Holmoe and the Russian islands Walloe, so that the free passage is only about 25 m. wide. To the N. of the Quarken the gulf preserves a width of from 50 to 60 m. for some distance, but it afterwards widens to 100 and even 120 m., which breadth continues to its northern termination. The land on the N. of the Quarken is properly called Bottniska Wicken (the gulf of Bothnia).

The coasts S. of the Quarken are rocky though not high on both sides of the gulf; but in general higher on the western side, where the English warm waters of the Gulf Stream influence the climate. To the N. of the Quarken the coasts are low and sandy, with the exception of a tract near the straits on the Russian side, where they are rocky but likewise low. The largest part of the coasts of this northern portion is formed by an alluvial deposit broken down by numerous rivers.

Under Baltic (p. 347) is noticed the small degree of saltiness of the waters of that sea, and of the gulf of Bothnia in particular; and also that the surface of the latter is frequently covered with ice, so that it is possible to pass over it during the winter. Bothwell extends his voyage towards the east along the coast of the Gulf of Bothnia, and makes note of its rainfall and of the ice on it. The most remarkable instance in modern times was the passing of a corps of the Russian army under the command of Barclay de Tolly in the last war (1809). It was effected in the month of March; the soldiers were obliged to pass two days on the sandy shores and on the ice, and reached Umea the third evening.

There is no want of good harbours in the gulf; but the navigation is interrupted by the ice for five months to the S. of the Quarken, and for six to the N. of it. The latter portion of the gulf is very rarely visited by foreign vessels; the produce of the adjacent countries being brought in the small coasting vessels of the country to Stockholm and the larger towns of Finland. The southern part of the gulf is however annually navigated by some English vessels, which sail up the Gulf Stream, the regular voyages of some British vessels also bring these articles to England. Fish is not abundant, with the exception of a kind of small herrings, called by the Swedes strömmings, which appear in summer in great numbers on the W. coast of the gulf, especially S. of Helsingfors. When nearly all these fish are caught, the coast S. and N. of Hernisund are occupied in catching them. The greater part are dried, but a considerable portion undergo a fermentation in a closed cask, after having previously been a little salted, and exposed to the air for a few days, which is called surströmming. Both the dried and sour strömmings are exported to the neighbouring countries, and are used by the lower classes in a great part of Sweden.

Bothwell, James Hepburn, Earl of, was the son of William, 1st Earl of Bothwell, of the Hepburn family. His mother, Agnes, daughter of Henry Lord Sinclair, by a daughter of Patrick Hepburn, first Earl of Bothwell, lived many years in a state of divorce from her husband, but for what reason is not certainly known. Earl Patrick was notoriously profligate in his public character. He died in September, 1556, at the age of 51; when his son James succeeded to his honours, offices, and estates. The death of the first Earl of Bothwell was deeply mourned by the rulers of Scotland, Sheriffs of the Shores of Berwick, Edinburgh, and Haddington, and Baillie of Lauderdale, all which he had himself inherited. The Hepburns were originally mere tenants of the earl of March; but in a short time they coped with their potent chief, and, on his forfeiture in the fifteenth century, they rose to be immediate tenants of the crown, and shortly afterwards the head of the house was made a lord of parliament. The influence and power of the family reached its height in the time of Patrick Hepburn, second earl, who received from the crown numerous grants, the lands and lordships of Bothwell and Crichton, which were thereupon erected into an earldom. The lands of the lordship of Bothwell however were hardly in his possession, when, at the king's command, they were transferred to the earl of Angus, in exchange for the turbulent burgh country of Liddesdale, the king then saying there was no order to be had with the earls of Angus so long as they kept Liddesdale. The second earl of Bothwell succeeded to his father's titles, heritable offices, and vast estates in the several counties of Edinburgh, Haddington, Roxburgh, Dumfries, Kirkcudbright, and Lanark, which, on his fall at the fatal field of Flodden, passed to the father of Earl James, who, notwithstanding the misconduct of his parent, was by descent the most powerful noble of the south of Scotland, and had the earlship of Bothwell and the barony of Crichton, the shire of Haddington; and Crichton, in the shire of Edinburgh. These fortunes are now mouldering into dust, and the surrounding country is rich with the peaceful labours of the plough. In the times we speak of, the forfeited lands were free for a feu, and the defile was secured by predatory bands. The church and a few great lairds mutually rivalled and despised each other, and a series of regal minorities allowed them all to attack and despoil the crown. It had also become the policy of the crown to give a separate interest to the several divisions of the nation; and in the year immediately preceding Earl James' succession to the Bothwell estates, the Scottish reformer Knox had begun to denounce in the capital the errors of the established faith and the baneful spirit of its ecclesiastics.

Till his father's death, Earl James remained, as it seems, abroad, probably with his father, who, after alloying himself with Edward, king of England, against his sovereign, fled into foreign parts; but immediately on his father's decease, the king of Scotland sent a large force and occupied the town about then about 30 years of age. He was served heir to his father on the 3rd of November, 1556, and he attended the parliament of December, 1557, when a commission of the estates of the realm was appointed for negotiating the marriage of the earl of Bothwell with Mary, sister of the King of France. In the parliament of November, 1558, he was named one of the lords of the articles; soon afterwards, we find him as lieutenant of the borders meeting, with the earl of Northumberland, the English lieutenant, to adjourn some border differences; on the 30th October, 1559, he is found, under the orders of the queen regent, intercepting Cockburn, of Ormonist, near Haddington, when that baron was bringing supplies from England to the party of the reformation; and the following month, when the reformers retreated towards Scotland. He married Margaret, daughter of John, one of the reform leaders, a traitor to the government. Next year the queen regent died, and soon afterwards the presbyterian form of protestantism was formally established, the reform leaders or lords of the congregation taking the reins in their own hands. In the early years of the reign of Francis of France, died; and in contemplation of Mary her widowed queen's return to Scotland, several nobles of the protestant party were despatched to France with a tender of their services. In this company we find the earl of Bothwell, and the earl's father's wife, who had engaged with the times and acceded to the congregation. Mary, then scarse 20 years old, landed at Leith on the 19th August, 1561; and in forming her government, she set her bastard brother, Lord Bothwell, over the government of Scotland. As soon as the new government was formed, the earl of Bothwell, whose sister Lord James had recently married, one of her privy council; the other members of the government and chief officers of state being also protestants. The government however of which Bothwell

No. 304. [The Penny Cyclopaedia.] Vol. V. S. 2
was thus a part, was frequently disturbed by his violence, his contests with the earl of Arran, his brother-in-law, and his later adventures. For instance, in his trial for treason at December, 1561, summoned to court, and then ordered to quit Edinburgh till the 8th of the following month. In March, 1562, he endeavoured to get Arran, to whom he had become reconciled, to conspire with him in seizing the queen. The idea was abandoned, and Arran put her brother in possession of the forfeited earldom of Murray; and detaining her in captivity till she should acquiesce in his measures. But Arran having revealed the matter, he and Bothwell were both committed to Edinburgh castle, whence they were released next day after confessing himself awhile in his own retreat at Hermitage, got to sea, but was taken again at Holy Island. Randolph pressed his detention much, representing him as the "determined enemy of England, despiseful out of measure, false and treacherous. Without words or writing, but to his will and pleasure; but soon afterwards he returned to Scotland again. "The queen," (Mary), says Randolph, in one of his despatches to Cecil at this time, "misliketh Bothwell's coming home, and hath summoned him to undergo the law or be proclaimed a rebel. He is charged to have spoken dishonourably of the queen, and to have threatened to kill Murray and Lethington."

The dishonour here alluded to was probably the same as that mentioned in another despatch to Cecil of date 30th March, where he says "Bothwell hath grievously offended the English queen by writing letters by which he appears to advocate an English queen, and also against herself, calling her the cardinal's (Beaton) where: she hath sworn unto me upon her honour that he shall never receive favour at her hands."

The following month we find a despatch from Bedford to Cecil that Bothwell was "a man of uncertain and unnatural crime; and, about the same time, Bedford writes to the same minister that Bothwell "hath been in divers places, at Haddington, with his mother, and elsewhere, and findeth no safety anywhere. Murray followeth him about, and others say he will not leave the place." By the queen's directions, he was, for his treasonable conspiracy of March, 1562, indicted before the lord justiciar on the 2nd of May. On that occasion, the earl of Argyle, the justiciary, and the earl of Murray, came to Edinburgh, as commissioners of 50 judges to try the cause; but Bothwell had embarked at North Berwick for foreign parts, and not appearing at the trial, was outlawed.

In this depth of debasement however Bothwell watched every opportunity to spring again into royal favour; and when the queen married her cousin Darnley, he returned to Scotland. In the beginning of October of the same year we find him one of the new privy councillors, and a leader of the royal army against Murray, Arran, and others who opposed the match; and on the 31st of the same month Robert Crichton, "My Lord Bothwell's great kinsman," for his act of vice, doth now all, next to the Earl of Atholl."

The following spring, Bothwell, then at the age of 41, married Lady Jane Gordon, sister of the Earl of Huntley, whose father had been Lord Chancellor of Scotland. In the murder of Rizzio, the queen's secretary, at the instigation of the jealous Darnley, Bothwell stood by the queen and was opposed to the enterprise; and the following night we find him among other nobles attending the royal pair within the castle of Dunbar in his shire of Haddington, whither the queen had retired. Some claim that of whom Bothwell had the custody. The king and queen soon afterwards returned in a sort of triumph to Edinburgh and proceeded to the castle, where she immediately sent for Argyle and Murray, and had them reconciled to Huntley, Bothwell, and Atholl. Bothwell had only obtained the aspect of the nobility. In a letter from Alnwick, of date 3rd of April, 1566, it is stated that one of Bothwell's servants confessed that he and four more of his fellow-servants had been engaged by Lethington to murder Bothwell, the other servant's profession made him a good subject of what was for Bothwell had the custody. The king and queen soon afterwards returned in a sort of triumph to Edinburgh and proceeded to the castle, where she immediately sent for Argyle and Murray, and had them reconciled to Huntley, Bothwell, and Atholl. Bothwell had only obtained the aspect of the nobility. In a letter from Alnwick, of date 3rd of April, 1566, it is stated that one of Bothwell's servants confessed that he and four more of his fellow-servants had been engaged by Lethington to murder Bothwell, the other servant's profession made him a good subject of what was for him the crime; but though he continued in Edinburgh, no steps were taken against him till the 28th March, when Lennox, the father of Darnley, avowing himself his accuser, the privy council ordered him and others to be indicted for the murder. Three days before the trial Murray set off for France without any known business; and at the trial Bothwell stood and was acquitted; but when the mode in which trials were at that time conducted in Scotland is considered, it will not be held as really immaterial in determining the value of his innocence. Towards the parliament assembled at Edinburgh and Bothwell was one of the commissioners who met the estates. He also carried the sword of state before the queen when she was not at parliament in person; and in the same parliament he was one of the commissioners. On the 27th day of the last day of the parliament various ratifications were passed in favour of different persons. The Earl of Murray, though absent, obtained a ratification of his lands and earldom, Morton got a ratification of his lands with those of Angus
his relation; Huntley's forfeiture was reversed, and Both- 
well had his lands and offices, both hereditary and ac-
quised, confirmed to him. The preamble of the statute in this last case states that "it was not within the power of the q
queen's consideration of Bothwell's 'great and ma-
ifold gude service done and performit not only to his
hienes honor well and estimatation, but alas to the commone
will of the realm and leiges thereof,' and therupon follows a
description of the crown estates of the captaines of Dunbar
castle. On the morrow, after the raising of the
parliament, the leading persons of the government met
and had a supper at Ainsley, where they signed a bond in Both-
well's favour, approving of his acquittal, and recommending
him as a fit husband for the widow queen, pledging them- 
selves also to defend the marriage. On the 21st April
the queen went to Stirling to see her son, and while returning,
on the 24th, she was met at Almonds bridge, near Linitori-
gow, by Bothwell and a great company who seized her per-
son and carried her off to the castle of Dunbar. 'There
says Melville, 'the Earl of Bothwell boasted he would
marry the queen, who would or would not, yea whether she
would herself or no.' 'Captain Blackwater (he adds)
alledged it was with the queen's consent. And then the queen
could not but marry him, seeing that he had ravished
and lain with against her will.' A double process of
divorce was soon afterwards raised, one by Lady Bothwell
against the earl for adultery, and another at his instance
against her on the ground of consanguinity; and on the 3rd
and 4th days of the session, they were heard in divinis-
spective. Bothwell now brought the queen to Edinburgh,
where the banns of their marriage were proclaimed, and on
the 12th of the same month the queen came into the court
of session, and after testifying her perfect freedom of per-
son and fortune and his, published in the presence of
his accomplices in her abduction. She afterwards created
Bothwell Duke of Orkney; and on the 14th May she en-
tered into a contract of marriage with him, which was re-
corded the same day. Next day the marriage was solemn-
ised at Holyrood by Archibald Bothwell, abbot of Holyrood-
house and bishop of Orkney.
Bothwell had now gained the summit of his ambition; but
it was attained with guilt, and from his height he was
quickly precipitated into everlasting infamy. An indignant
people repudiated him, and he and the queen fled from
fortress to fortress till, on the 14th June, she came out to
meet the insurgents at Carberry-hill. In the evening
however she joined the chiefs, and was by them conducted
to Edinburgh. Bothwell left the queen, and fled to Dunbar,
where he was taken before sub judice, and on the 14th
Orkney Isles. Being pursued in his voyage, he sailed for
the Danish shores, where he was seized and put in prison.
He prolonged a miserable life till 1576, when he expired in
the castle of Malmy. He left no children, and all his houses
were forthwith seized and forfeited.

BOTHWELL BRIG. The scene of a battle between the
Duke of Monmouth and the Covenanters, on the 23rd June,
1679, is situated in the par of Bothwell, in the Middle Ward
of Lanarkshire, Scotland, 9 m. from Glasgow, and 3 from
Hamilton. It is now altogether altered from what it was
at the time of the battle, the bridge has been widened from
12 to 34 ft., the gateway with which it was fortified near the
S.E. end removed, and the approaches to it made more
level, while the adjacent fields have been enclosed and cul-
tivated. So far as we are able to trace the course of
Hamilton, the assassin of the Regent Murray, stretches
along the N.E. bank. The ruins of Bothwell castle, for-
merly an important fortress, stand on the N.W. bank; they
are much dilapidated, but the large and bold front to the S.
and the circular towers at each end, above the steep and
wooded banks of the Clyde, make a scene exceedingly
grand and impressive.

ROTHYNO'DRES (Entomology) a genus of Coleo-
terous insects of the family Curculionidae; generic charac-
ter—body oblong; rostrum thinner than the head;
bent downwards, and having a longitudinal elevated line
above. Antenna geniculated, * rather short and thick,
twelve-jointed; the basal joint long, thickened towards the
apex; the second joint short and stout, the third twice as
long as the following short; the eighth rather broader than the last; the remaining or terminal joints

* Antenna that have the terminal joints suddenly bent at an angle with the
basal, (of kused) are said to be geniculated; this character is common in the
antenna of the Curculionidea.

form a spindle-shaped club. Thorax narrower before than
behind, the base with an impression in the middle. Elytra
oblong, with an observe tuberice towards the apex. Legs
marinate; 

This genus apparently links the genera Cleonus and Lixus

* * * * *

* Sylas of an Elementary Course of Lectures on Comparative Anatomy.

* Botryllus zoolog., a genus of the second tribe (Aggregata Asci das) of Asci das, a family of the fourth
order (Heterobranchiata) of Aculphalopus (headless) Mollusks, according to De Blainville.

* This genus was observed by Gaertner, and afterwards established by the French, makes it the first of its
Aggregata (Aggregatæ Animals), the second family of its Aculphalopus Mollusks without shells. Lamarck
arranges it as the ninth genus of his first order of Tunicated animals (the Agglomeratæ Tunicata or Botryllia-
riens). These creatures afford a curious example of the varieties of animal life. According to Audouin and
Milne Edwards, the individuals which at a certain period of their existence unite to form one common mass or system, float separate
and free at first. The admirable Savigny, whose labours in this department cannot be sufficiently admired, trated the organization of this singular race; and Desmax-
rest and Lesueur have more particularly laid open the struc-
ture of Botryllus and Pyrosoma.

The Branchiae, or breathing organs, of these Aggregated Asci dasians form one whole, the food must pass as it
arrives at the mouth. Their principal ganglion is between
the mouth and the vent, and the disposition of the viscera
and ovary very nearly resembles that of the other Asci-
dians. The aggregated animals thus found together 'are
almost always in a state of contraction, soft, irritable, and
contractile, changing their form with the slightest move-
ment.'

Ellis, as Lamarck observes, regarded the stars of Botry-
llus as being formed of as many different animals as there
were rays.

In Owen's 'Syllas,' * which, founded as it is on a most
industrious and clear-sighted search into animal organiz-
ation, we recommend to the attention of all zoologists and com-
parative anatomists, these animals will come under the four
externals found there; the ganglia of whose nervous system are disposed more or less irregularly across the body, which is accordingly more or less unas-
symmetrical in figure.

The genus Botryllus has been subdivided by authors, as
we shall presently see. De Blainville, who evidently is of
opinion that this subdivision has been founded on considerations
of small importance, gives the following as the generic char-
acter.

Body oval, more or less flattened, adhering to submarine
bodies by its dorsal surface and by its sides to other indi-
viduals of the same species more or less numerous, so as to
present the appearance of a complex animal, or of one
whole slightly variable in form. The two openings are
clearly visible at the two extremities of the body; the one
external furnished with a tentaculal papillae, the other in
ternal somewhat tubular and very small.

* Species grouping themselves in concentric circles so as to constitute an orbicular mass, nearly in the form of a
saucer.

GENUS DIAZOMA (Savigny).*

* Of this division the Botryllus of the Mediterranean (Botryllus Mediterraneus) is an example.

** Species disposing themselves circularly or in rays, often
sufficiently regularly disposed around a centre, so as to
form one or more stelliform systems, imbedded in a hori-
zontal gelatinous mass.

* Syllas of an Elementary Course of Lectures on Comparative Anatomy.

* Botryllus zoolog., a genus of the second tribe (Aggregata Asci das) of Asci das, a family of the fourth
order (Heterobranchiata) of Aculphalopus (headless) Mollusks, according to De Blainville.

† Diazoma is comparatively large in size.
with fifty or a hundred eggs, and then having exhausted herself, she slowly flies away, or drops at once and dies.

If a horse at grass is carefully examined in August, some hundreds of these minute eggs will be found about its legs and the back part of the shoulder, and few or none out of the reach of his tongue. In two or three days these eggs are sufficiently hatched. Possibly the horse feels a little inconvenience from all this glutinous matter sticking about and stiffening the hair, and he licks the part, and by the pressure of the tongue, and the mingled infection of the warmth and moisture of the mouth, and a small worm escapes from each. It clings to the tongue, and is thus conveyed into the mouth; thence it is either carried with the food into the stomach, or, impelled by instinct, it travels down the gullet, being of too tiny size to inconvenience or annoy the horse. Thus it reaches the stomach, and, by means of a hook on each side of its mouth, affixes itself to the cecal or insensible coat of that viscus. It scoops out a little hole, into which its muzzle is plunged, and there it remains until the early part of the summer of the following year, feeding on the mucous or other matter which the coats of the stomach afford. It has now become an inch in length and of corresponding bulk, and ready to undergo its change of form. It detaches itself from the cecal coat to which it had adhered, and plunges into the food which the other and digestive portion of the stomach contains; it passes with the food through the whole length of the intestines, and is discharged with the dung. Sometimes it is not perfectly enveloped in the fecal mass; it then clings to the sides of the anus, and hangs there firmly until there is a soft place beneath on which it may drop; it then hastens to burrow into the earth, and, if it has escaped the birds that are eagerly watching for it, it has no sooner hollowed for itself a convenient habitation than a shelly covering is formed around it, and it appears in the state of a pupa or chrysalis.

It here lies turgid for a few weeks preparing to undergo its last change. It assumes the form of a perfect fly; it then bursts from its prison, rises in the air, and seeks its mate. The work of fecundation being accomplished, the male immediately dies: the female lingers a day or two in order to make a proper deposit for her eggs, and her short life also terminates.

It is in the larval or caterpillar state that the bot is most known. The stomach of the horse sometimes contains an almost incredible number of them, the cuticular portion of that organ being in a manner covered with the species of them in a manner covering with the stomach of the animal. They have also travelled farther than the stomach, and have irritated and choked the first intestine, and thus destroyed the horse; and, even in their natural habitations, the animal is probably some unwholesome miasm arising from other causes, they have perforated it and caused death.

These however are rare occurrences; they are exceptions to a general rule. The plain matter of fact is, that a bot, if it is once turned out in July and August, and therefore almost necessarily has bots, enjoys just as good health as another that has been stayed during this period. He is in as good condition, and as fully capable of work when the cuticular coat is crowded with full-formed bots as he is at any other time. Other persons have reported that they are passing through the intestines to seek a new habitation.

Some persons have maintained that their presence in the stomach is beneficial. It has been said that, by their constant action on it, in the suction of their food, they cause it to the full exercise of its digestive powers. It was forgotten however that their habituation is not the digestive portion of the stomach. They have been said to assist, by the hard and irregular surface which they present, in the trituration of the food; but the function discharged by the digestion takes place in the stomach, on which they are simply one of maceration. There is no necessity for supposing that their presence is beneficial to the horse. The truth is, these insects find here a secure and comfortable abode during their larval state, without, generally speaking, producing any other inconvenience to the horse than the temporary irritation which they occasionally excite when making their escape.
The horse-owner therefore will care very little about them. He will remove them when they are hanging around the anus; but he will never have recourse to physic on his account, because it is rare indeed that they do any harm, and, if they did, their muzzles are buried so deeply in the cuniculus that no medicine that is safe to administer can possibly have any effect upon them.

A smaller species of bot, called from its colour the red-bot, is occasionally found in the stomach; but the fly from which it proceeds has never been accurately described. There is a strong opinion that the red-bot is more injurious than the common bot.

A third species, the Oestrus hemorrhoidalis, or fundament-bot, is better known. The fly is considerably smaller than the common Oestrus equi; it is of a brown colour, with the head surrounded by yellow, and the mouth is furnished with exceedingly stiff bristles. The fly may be seen darting between the thighs of the horse and around its croup, and following the motions of the tail until the animal is preparing to dung. During the evacuation of the dung, and the subsequent protrusion of the intestine, it darts upon and tears the gut with its pincers, and deposits an egg in every wound. The horse does not seem to suffer any pain during this operation, for he stands passive; and the little worm, soon produced from the egg, establishes its abode in the place in which it was deposited. It lives by digestion of the ulcer to which it has access, and at the same time that the common bot does from the stomach. Those bots are often seen within the verge of the anus, and occasionally seem to be productive of a slight degree of irritation. They are smaller than the common bot, but much more painful, and, like the latter, give a greyish hue to the fly. It may often be seen in copes, and particularly on rails in the neighbourhood of a cope. Every shepherd ought to make himself acquainted with it, for it may then be easily crushed and destroyed. It prevails most in June and July, and is sometimes an intolerable nuisance in woody countries. If only one of them appears the whole flock is struck with terror; and if there is any place in the field devoid of pasture the sheep crowd to it, turning their heads towards the centre of the group, with their muzzles to the sand, and their feet in continual motion in order to secure themselves from the attack of their foe. The Oestrus endeavours to get at the inner margin of the nostril, and, darting upon it with the quickness of lightning, deposits her egg. The warmth and moisture of the part speedily hatch it, and the little worm escapes. It crawls up the nostril, it threads all the sinuositites of the passage, and finds its way to some of the sinuositites connected with the nose. The irritation which it occasions as it travels up the nose seems to be exceedingly great. The poor animal gallops furiously about, snorting violently, and almost maddened by the annoyance. At length the worm reaches some of the convolutions of the turbinated bones of the nose, or the antrum or cavity of the upper jaw, or the frontal sinuses, it fastens itself on the mucous to the sand, and their feet in continual motion in order to secure themselves from the attack of their foe. The Oestrus endeavours to get at the inner margin of the nostril, and, darting upon it with the quickness of lightning, deposits her egg. The irritation which it occasions as it travels up the nose seems to be exceedingly great. The poor animal gallops furiously about, snorting violently, and almost maddened by the annoyance. The farm worker does not pay the attention which he ought to these war-worms. It is true that the cattle on the tumours once formed, do not appear to suffer any inconvenience from its existence; and the farmer is accustomed to associate with the appearance of a few warbles the certainty of the thriving condition of the beasts; but he forgets the pain and terror which the animal has already suffered, and that which he has yet to undergo, and he also forgets the deterioration of the hide. The hole made by the bot in his escape will apparently close, but not until after a considerable period has elapsed, and never with a substance so firm and durable as the first. It is easy to destroy the creature in its cell. The pressure of the finger and thumb will effect it, and while the beast will escape considerable annoyance, the hide will not be damaged.

The goat and the different species of deer, and, in fact, almost the same peculiar manner, and the same organs pass this portion of their existence within some living animal, it seems natural to extend the term to them all.

* Both the red-bot and the hemorrhoidalis belong to the species gasteropoda. And to the larva of these three the term bot has been by many authors restricted; but as the larva of all the ovari pass this portion of their existence within some living animal, it seems natural to extend the term to them all.

* It is probably this fly, or some one like it, that Virgil (Georgic, III. 146) describes as driving the cattle mad in the south of Italy.
almost all animals, have their peculiar tormentors, but the
distinctions and habits of these varieties of the Ostrus
are not well known.

BOTARI, GIOVAN/ANNI, was born at Florence in 1689, studied Latin and belles lettres under the learned
Biscioni, and Grecian under Saluzzo; and was afterwards given
memorabilia, and theology, in which last he took his doctor's
degree in 1716 in the University of Florence. The Academy
of La Crusca made him one of its members, and entrusted
him with the task of preparing a new edition of its great
vocabulary, in company with Andrea Alamanni, and Rosso
Mazzuchelli. The first edition appeared in 1725, and the
second in 1730; and the new edition was published in 1738, in 6 vols. fol. Botari
was also made superintendent of the grand ducal printing
establishment at Florence, where he published new editions
of several Tuscan writers with notes, and several works of
Vinci, Ercolani, and others. From Fratelli Guitton
d'Arezzo, &c. In 1729, he wrote Leshion Dire Sopra il
treemuto on the occasion of an earthquake which occurred
at Florence in that year. In 1730 he went to Rome, where he
fixed his residence. Clement XII. gave him a pension, and
the chair of ecclesiastical history in the University
of Sapienza, and employed him in 1732 together
with Bustachio Manfredi, on a survey of the Tiber through-
out Umbria, in order to ascertain whether it could be rendered
navigable. The result of this survey was published as
1. Scritti di Elogi e di Studi by Rosso Maria del Popolo, Nuovo sotto
Perugia fino alla face della Nera.' Botari made a similar
survey of the Teverone. His next publication was a learned
work on the monuments found in the numerous and vast
subterraneous vaulns near Rome, commonly known by the name
of la catacombe. The work was engraved and published in
1733 by order of the Scuola di S. Sebastiano, and the report
was published by the Cardinal del Rota, and the Oriental
College of Rome, and was published by the Cardinal del Rota,

is this from being the case that it is just as much employed as ever, and in combination with these additional powers, which were originally intended to supersede it. Such is the nature of prejudice, and such the inevitable consequence of blinding, that in any country the loss of the income from the bottom heat large sums are annually expended, without the smallest return. All that bottom heat could possibly do is bettered by ordinary heating apparatus, and the cost of the bottom heat is altogether thrown away.

I am sure that if any one now comes with us more closely we approach nature in our management of plants the more certain are we to succeed in our attempts at cultivation. It therefore becomes an important question whether bottom heat has any existence in nature; of course it can only be looked upon as the result of the data that we possess upon this subject, although not very satisfactory; insufficient to enable us to answer in the negative. The water vines of the woods of Africa and India abound in a fluid which is much cooler than that of the atmosphere; its coolness is owing to that of the soil from which it is rapidly attracted; there can be no bottom heat in such cases. The most vigorous vegetation of the tropics is in woods where the soil is shaded from the direct action of the solar rays; we cannot suppose that bottom heat has any existence there. The contrary when any such temperature as that which results from a decayed mass of vegetation, the carbonic acid of the air in the proper state of warmth and humidity; this done the earth must of necessity partake in the temperature, and any effect of bottom heat that is desirable is gained. It is therefore to be recommended that the whole system of bottom heat be done away with where other modes of regulating temperature exist.

BOTTMORY, BOTTOMREE, or BUMMAREE, is a term derived into the English maritime law from the Dutch or Low German. In Dutch the term is Bommersie or Bodemer, and is derived from Bodem or Bodem, which in Low German and Dutch formerly signified the bottom or keel of a ship; and according to a common process in language, the part being applied to the whole, also denoted the ship itself. The same word is used in French, which was much in use in the countries in the English language; the expression bottom having been commonly used to signify a ship, previously to the seventeenth century, and being at the present day well known in that sense as a mercantile phrase. Thus it is a familiar mode of expression among merchants to speak of 'shipping goods in foreign bottoms.'

The contract of bottomry in maritime law, is a pledge of the ship as a security for the repayment of money advanced to an owner or master, for the purpose of enabling him to carry on his navigation. This is usually expressed in the form of bond, called a Bottomry Bond, that if the ship be lost on the voyage, the lender loses the whole of his money; but if the ship and goods arrives properly, he becomes the immediate owner of the goods, and of the money previously lent, and also the premium or interest stipulated to be paid upon the loan. No objection can be made on the ground of usury, though the stipulated premium exceeds the legal rate of interest, because the lender is liable to the same rate of interest on the amount of the bottomry. In France the contract of bottomry is called Contrat à la grosse, and in Italy Cambio marittimo, and is subject to different regulations by the respective maritime laws of those countries. By the Germans it is termed Bodemer, and is different in many of its incidents from Bottomry in this country.

In taking up money upon Bottomry, the loan is made upon the security of the ship alone; but when the advance is made upon the lading, the then borrower is said to take up money at responsenda. In this distinction as to the subject matter of the security, consists the only difference between Bottomry and Responsenda; the rules of English maritime law applied to one, and German law to the other, enumerates seventy articles on Bottomry. If the ship and cargo were lost, the lender could not recover his principal or interest; which stipulation was often expressly made in the (cyoppag) bond. (Demosieus against Thorsson, and against Donysorocus, c. 6. 10.)

Money was also lent, under the name of pecunia tragicitia, on ships among the Romans, and regulated by various legal provisions. The rate of interest was not limited by law, as in the case of other loans, for the lender ran the risk of loss. If in the event of the loss of the goods the interest which the borrower attempted to defraud him: damages also were claimed, conformably to the terms of the bond. As neither principal nor interest could be demanded if the vessel were lost, it was a common plea on the part of the borrower that the ship was lost.

Money was also lent, under the name of pecunia tragicitia, on ships among the Romans, and regulated by various legal provisions. The rate of interest was not limited by law, as in the case of other loans, for the lender ran the risk of loss. If in the event of the loss of the goods the interest which the borrower attempted to defraud him: damages also were claimed, conformably to the terms of the bond. As neither principal nor interest could be demanded if the vessel were lost, it was a common plea on the part of the borrower that the ship was lost.

BOTZEN, CIRCLE OF, is one of the 7 circles or administrative divisions into which the government of Tyrol is divided. It is also called the circle of the Etzache (Adige) from the river of that name which runs through it, first in a S. direction from its sources in the Gruns, then E., from where it bends to the S.E. as far as the confines of the Lake near Botzen, from whence the united stream flows S. towards Trent. The valley of the Etzache from Gruns to the confines of the Lake, a length of about 45 m. The circle of Botzen is reached from Gruns by the road from Gruns to Meran, which bears the name of the Vinschhag, and is a fine alpine district, rich in pasture and also in fruit trees. Meran is a small town with old walls and towers, and was formerly the capital of the original county of Tyrol, which was much more extensive than the present circle of the same name. The castle of the former counts rises on a hill about 3 m. from Meran. N. of Meran is a traverse valley opening into the great valley of the Etzache, which is called the Passy and is known in consequence of the noble district of Andreas Hofer, the Tyrolese chief, who fought against the French and Bavarians united in 1809, and was taken and shot at Mantua in 1810. Hofer's house is to be seen in the Passytrall, about 10 m. N. of Meran. The Etzache and its tributaries form three rapids for the space of 1 m., which have a very striking effect. Below Meran, towards Botzen, the valley becomes wider, and Botzen itself is in a kind of plain formed by the meeting of several valleys. This part of the country produces good vineyards, and fruit trees and also asparagus, the fields by means of small canals and locks is established here as well as in other valleys of the Alps. The circle of Botzen is bounded on the E. by the circle of Pusterthal or Bresil; on the S. by that of Trent; on the N. by that of the Oberinnten, which is the upper part of the Rhetian Alps; and on the W. by the Veltlin and by the Munsterthal in the Grisons, being divided from the former by the Stilser Joch and the Ortler, and from the latter by the Wormser Joch and the high ridge called the Lamer. These three circles, besides Botzen, are Meran and Gruns, each with a pop. of between 2000 and 3000 inh., and many large villages. The language of the people is German, though at Botzen
and in the neighbourhood a dialect of the Italian is spoken almost universally. In the upper part of the valley, about Meran, the primitive simplicity of the Tyrolean manners still prevails. *(Voyage pittoresque dans le Tyrol, et dans une partie du Comte de Brav; Inglis's Tyrol; Malte Brun's Geography.)*

**BOTZEN,** in Italian Bolzano, the chief t. of the circle of the Etsch, in the principality of Tyrol. It is situated in a pleasant valley, sheltered from the N. winds, on the r. Etsch, an affluent of the Etsch or Adige, and just above the confluence of the two rivers. The traveller coming from Innsbruck, after having passed the ridge of the Brenner and the t. of Brixen, finds at Botzen the climate and the productions of Italy. Even the habits and the language of the people are in a great part Italian, although German is also commonly spoken. This part of Tyrol, S. of Mount Brenner, is commonly called the Italian Tyrol, and it communicates with the plains of Lombardy by the valley of the Adige.

This town is a newly built t. of near 8000 inb., and is known chiefly for its fairs, which are frequented by commercial travellers from all parts of Italy and Germany. The country near Botzen produces wine and fruits in abundance. Botzen is on the high road from Italy by Rovereto and Trento to Innsbruck, which was the only communication between but two countries, the Tyrol and Lombardy, before the opening of the new road over the Stiller Joch. *(Bormio.)* A cross road strikes off from Botzen to the W., ascends the valley of the upper Etsch by Meran, and meets the new road at Mals near Glurns. From this town the route commencing from the lower part of the Joch can go to Innsbruck, either by Botzen and the pass of the Brenner, or proceed from Mals up to the sources of the Etsch and then descend by Nauders into the valley of the Inn which he then follows to Innsbruck, meeting at Landeck from Sankt Ulrich into the Tyrol. Botzen is 113 m. N. by E. of Trento.

**BOUCHAIN,** a t. in France, dep. of Nord, of no great importance except from its fortifications, and from some historical interest attached to it. It is on the Escouf or Shield, and on the Rhone; situated nearest to Cambrai and Valenciennes, about 10 m. from each, and 115 m. N.N.E. from Paris; 59° 57' N. lat., and 3° 17' E. lon.

In 1711 the Duke of Marlborough invested Bouchain, having, by the most skilful manœuvring, passed without bloodshed the strong lines with which Marshal Villars had covered the French frontier in this quarter. The French commander had boasted of these lines as impregnable, saying that he had brought Marlborough to his ne plus ultra. The simplicity of the work of construction, and the confusion of the neighbouring country was partly laid under water; a French army superior in force to that of the allies, and commanded by a general of the greatest ability, watched every opportunity for interrupting the siege; and the town itself was secured by the skill of the garrison, which, in all difficulties, and the garrison was forced to capitulate in sight of the French army, which could not relieve the place. This exploit closed the campaign, and with it the long and brilliant successes of the English general. Bougainville was taken in 1719 by Marshal Villars, and the possession of the town secured to France by the treaties of Utrecht and Rastadt, which were concluded shortly after.

Bouchain consists of two parts, the upper town and the lower town, which are separated from each other by ditches, filled up, and the streets of the Sensaci, and the deep ditches which surround the fortifications. The parish church and the town-hall are in the upper town. The population is given in the *Dictionnaire Universel de la France* (Paris, 1804) at 1128: we have no later authority. *(Voyage pittoresque dans le Tyrol, et dans une partie du Comte de Brav; Inglis's Tyrol; Malte Brun's Geography.)*

**BOUCHER, REV. JONATHAN,** born 1804, a divine, a political writer, a general scholar, and an English philologist of the last century, to whose memory justice has hitherto been imperfectly rendered.

The son of a clergyman of little town of Wigton, at a place called Blencogo, where his father had a few acres of land, and if he were not one of those Cumbrians of whom Boucher himself says, that they "are contented to live, like their rude forefathers, in wretched hovels, on a scanty stock of provision, with less anxiety of mind than many other clergy," yet he lived in a style of frugality somewhat primitive, not unlike what the travellers in that part of the kingdom may now see in the houses of the small landed proprietors. It is not however unusual to find in the families inhabiting such houses that there is an uncle, a brother, or a son who is a schoolmaster in some distant county, or perhaps who is in the church; and the number is not small of persons of this Cumbrian origin who have attained a well-deserved eminence.

Boucher was trained first at a school at Blencogo, and afterwards at Wigton in grammar learning. At Wigton he had for his master, the clergyman of Graystock, Mr. Blaine, with whom he read some of the higher Latin and Greek classics. Mr. Blaine is described by one who was acquainted with him, as 'a man of true piety and learning, but affecting the rusticity which prevailed in the farmers around him, instead of endeavouring by a better example to show them how all the virtues they possessed might be exhibited in connexion with the deccencies and proprieties of life.' It is added, 'he spoke in the tone and dialect of his rustic countrymen, and took particular care that its Doric strength should not be debilitated by the introduction of courtly phrases.'

He then went to Oxford, but Boucher pursued his studies with great assiduity, and at the age of seventeen or eighteen he entered on the business of school-instruction. A gentleman residing at Wigton placed his children under his care; but in a little time he became an usher in the grammar-school at Saint Bees, which at that time, about 1746, enjoyed a high reputation under Dr. James, a good and learned master. While here, the instruction of youth in the rudiments of classical knowledge was his business; the perusal and study of the great writers, and especially of the great poets of antiquity, his recreation. He is said to have here executed a translation of *Tytau.*

About the year 1756 or 1757, as we may collect from circumstances, when he was about nineteen or twenty years of age, he left England, and took up his residence amongst the American colonists.

Such a man could not but be a valuable acquisition to any colony. His services were soon engaged by a gentleman in Virginia of wealth and respectability, as tutor to his children.

That power which natural talent, attainment and character, combined to give a man, was, being once put in contact, at once counteracted by some of the various forms in which an over-estimate of them by the party himself appears, was soon manifested. It was perceived that while he could make boys learned, he had the ability also to instil in them and make them better. The generosity of the parish of Hanover in the county of King George, Virginia, nominated him to the rectory of that parish in 1761, when he was only four-and-twenty. This nomination he accepted, and immediately crossed the Atlantic, where he resided first at Fredericksburg, then at Richmond, and from the Brush of London and mount and priest on the same day. After visiting his native county, he returned to take upon himself his new charge.

From this time to 1775 he continued in an assiduous discharge of his ministerial duties, and an endearing charity, to improve as far as in his power, the moral and intellectual state of the parts of America in which he was placed. He removed from the parish of Hanover to that of Saint Mary in Caroline county, Virginia, lying on the Rappahannock. When Sir Edward Eden became governor of Maryland, he appointed Mr. Boucher to the rectory of Saint Anne's in Annapolis, and afterwards of Queen Anne's in Prince George's county, where he was living in 1775, when there was a violent and sudden change in his affairs. These American colonies. Mr. Boucher has afforded us the means of judging with tolerable accuracy how his talents, station, and character, were made to bear upon the feeling and action of the people with whose interests he had connected himself. Many years after, in the course of disputes which he had delivered from the pulpit at various times during those years. Most of them were printed at the time when they were delivered. They are better entitled discourses than sermons. They are in fact the Ortho-epistles of the American colonists, and written at public occasions, when it is allowed to the ministers of religion to enlarge somewhat the usual limits of pulpit instruction. They exhibit a robust sense, a mind stored with classical erudition, and there are occasionally bursts of spirit of a love of arms. Another contends for a liberal toleration to dissenters and papists. In his discourse on the education suitable to the American colonists which he wrote in 1773, at the request
of one of the governors, he insists more on the necessity of a Christian education, though at the expense of his own favourite classics. He gave all the weight of his influence against the delusions of the wild sectaries who seem to have abounded in that colony. He was by no means a stranger to the popular enthusiasm; and on the whole he seems to have been inclined to a liberal policy, and to the maintenance of the independence and just rights of the colonies.

But when the time came that all connexion with the mother country was to be renounced, and all allegiance to the British throne, Mr. Boucher was one of those who neither admitted the principle, nor thought themselves at liberty to remain entirely passive. He continued to use in his church the public reading of the Bible, and to read the prayers in public at all, to conform to the unmuttilated liturgy of my church; and, reverencing the injunction of an apostle, I will continue to pray for the king and all that are in authority under him, and I will do so, not only because I am so com- manded, but being persuaded of the truth of the command, to lead quiet and peaceable lives, in all godliness and honesty. Inclination, as well as duty, confirm me in this purpose. As long as I live therefore, yes, while I have being, will I with Zadoc the priest and Nathan the prophet, proclaim—

This was a time when there could be no compromise.

His property, all of which was in America, was lost. He was so much an object of popular dislike that his person was in hourly danger, and, in 1775, he finally quitted American shores. He died in Liverpool, in 1780. His prospects thus blighted, he had to begin the world anew, aided by some compensation from the government at home for the losses which he had sustained with other American loyalists. Little is known of him during the next nine years of his life. But it is believed that he had recourse to his original profession, and that he established a school at Paddington. In the church he obtained no prebendary before 1784, when Parkhurst, a clergyman, the author of two well-known scriptural lexicons, to whom he had contributed the minor epistles of the New Testament in the Episcopalian version, Epics, at which place it is believed he went immediately to reside, and where he died.

In this last twenty years of his life we find him devoted, as in the former period, to religion, to politics, and to the precise study. He lived in the same manner as before he was spoken of, and prefixed to himself a dedication to Washington, whom with before the war he had been on terms of intimacy, and for whom he never ceased to feel a high personal respect. He added also a long preface, entitled a collection 'A View of the Causes and Consequences of the American Revolution.' He printed also two assize sermons, and in every way supported to the utmost of his power the Pitt policy in respect of France, adhering to the principles which he had maintained in Maryland. When the general war commenced, he had become a great sufferer. But the kind of literature to which he directed his attention was changed. It became more English. The love of his native country, which is said to be stronger in those born in mountainous regions than in the plains, had appeared to him in various forms. He addressed his Cumbrian friends on the backwardness which they showed in following in the track of public improvement. He wrote some of the best portions of Hutchinson's History of that county. He erected in the church of Sebergham a monument to the memory of Robert Adam. He also became a Fellow of the Society of Antiquaries of London, and was made an honorary member of the Society of Antiquaries of Edinburgh and also of the Stirling Literary Society. His acquaintance among the men devoted to antiquarian and literary pursuits was legion, and he enjoyed the intimate and particular friendship of several of them.

His mind at length became determined towards a particular object: it was to prepare a kind of supplement to the

Dictionary of the English Language by Dr. Johnson, in which he should introduce words provincial and archaic.

By provincial, he meant words which are still found in the speech of certain parts of England, though not found in writing or heard in the general intercourse of life or in polite; words however which are genuine portions of the English language, and to be found, most of them at least, in our early and almost forgotten writers. By archaic, he meant words which are found in those writers, though now regarded as obsolete, and which are not now, and perhaps never were, in any general use by the common people. These words it was his intention to illustrate by quotations from the authors in which they occur, and also by dissertations on their history in a manner much more at large than Dr. Johnson has thought necessary to do in respect of the purer and better terms which he had allowed to find a place in his Dictionary.

This was a design of great magnitude; and Boucher set himself to the accomplishment of it with great earnestness from the first, and with an energy which was truly admirable. He made his classical knowledge bear upon it with effect, and he obtained no mean acquaintance with the languages cognate to our own and the other modern languages of Europe. He had an intimate acquaintance with the dialect of Cornwall and the counties of England, from which he received contributions for his vocabulary, and sometimes valuable remarks.

But the plan on which he proceeded included more than is generally understood to fall within the province of lexicography. He was able to collect concerning many of the usages of the English nation—dress, sports, superstitions, whatever in short falls under the not strictly-defined term of popular domestic antiquities: what his work may, in many portions of it, be read for amusing or interesting the reader, as consulted as a dictionary for the illustration of the words which it contains. In this respect it resembles Dr. Jamieson's valuable Dictionary of the Scottish language.

Mr. Boucher died in London, 1790. It was not too late a period of life for him to indulge the hope and a reasonable expectation of being able to complete it, well-furnished as he already was with much of the information needed for such an undertaking. In 1802 it had so far advanced towards the publication of the work, and proposals for publication. His health however was then beginning to decline. In 1803 he visited his native county. He lived till the 27th of April in the following year, when he died without having committed any part of the work.

Of the dictionary thus left unfinished the letter A was published after his death as a specimen, by his friend and frequent correspondent Sir Frederick M. Eden. The merits and the value of his collection were understood in this specimen, and published an improved version by others who take an interest in such inquiries. But still there was not sufficient encouragement given to the family to risk the publication of so large a manuscript. It remained, with other papers connected with it, in the hands of the family, and has, as Blainville is said to be hoped that the work will be completed for though perhaps not entirely adapted to the present improved state of philological knowledge, and to be regarded rather as anecdotes of the language than as a complete lexicon of archaic and provincial words, it contains much valuable information, the result of original reading and original reflection.

For the facts in this life we have been principally indebted to Boucher's own writings, to the Gentleman's Magazine, vol. 74, p. 591, where is a biographical notice of him, and to his life by C. J. Blainville, which was published in 1829, entitled The Life and Literary Remains of Thomas Sanderson.
vene. The dep. lies along the coast of the Mediterranean, by which it is washed on the S.S.W.: on the N.N.E. it is bound by the dep. of Vaucluse, from which it is separated by the Sardanura: on the E. it is bounded by that of Provence, from which it is separated by the Rhône. The Île de la Camargue, or Carmague, an island of alluvial formation, enclosed by the sea and the two principal arms or outlets of the Rhône, is included in this department. The dep. is of a quadrilateral figure, in fact, its N.W. and S.E. sides respectivly equal to 41.47 and 42.14 m.; but the sea-coast, which is about 77 m. long in a straight line, exceeds by about 24 miles the side which runs along the bank of the Durance. The area of the dep. is 601,560 hectares (according to the last edit. of Malte Brun); while computing the hectaré into English acres, will give 1,487,529 English acres for the area, or 2,234 sq. m., being equal to about 10-11ths of the county of Devon. The surface of the department in square leagues, as given by Malte Brun, differs materially from the above measurement, which, however, we believe to be the more correct. The chief town is Marseille, which is 497 m. s. by E. from Paris, through Auxerre, Autun, Châlons sur Saône, Lyon, Vienne, Avignon, and Aix. The dep. is not, on the whole, mountainous, but there are some considerable elevations. The branches of the Alps, which stretch through the adjoining dep. of Var, and skirt the S. bank of the Durance in the upper part of its course, reach into the Bouches du Rhône, and cover the E. parts. Other eminences extend from these towards the W., presenting a range of mountains, with gradual ascents and abrupt descents, while the branches of the Alps are distinguished by their gradual declivities. The Île de Carmague, and that part of the dep. adjacent to it, are very marshy, and the sea forms several pools or étangs, two of which lies along the route of the Var; the Var and the Ile de Camargue, are of considerable extent. [BARTLE.] The sea-coast, low in the neighbourhood of the Rhône, is in other parts bold and lofty. Opposite to the coast are several small islands—Ratonneau, Pompigne, If (on which is a strong castle); 3 miles to the south-west, on the coast of the part of Marseille called La Major, Jaros, Riou and Planier. They are all of little importance. There is a tower on the Île de Planier, which lies farthest out to sea. The principal rivers are the Rhône, and its tributary the Durance, which bound the dep. on the N.W. and N.E. sides; the others are of minor importance, such as the Arc, which rises in the dep. of Var, and flows into the étang de Berre, after a course of about 45 m.; the Touloubre, which flows into the same étang, after a course of from 30 to 35 m., and the Verne, which falls into the Avière at Marseilles, after a course not quite equal to that of the Touloubre.

The island of Carmague, which forms a Delta, has Tinquetaille, a suburb of the city of Aries, at its apex. The testimony of the ancients makes it appear that the mouths of the Rhône was then enclosed by a large sandbank, in the manner of what is called the promontory of Frasassi in the province of Ancona. The most W. of the two streams already noticed has shifted its bed towards the W., enlarging the Île de la Camargue in that direction; while the accumulation of materials brought down by the stream has elevated the soil above the water, and caused the island to gain considerably on the sea. The E. arm of the Rhône there is reason to believe has been less variable: but the formation of alluvial islands causes its waters to be subdivided into several channels just before it reaches the sea, which branches are lined with sandbanks and sandbanks, and which are filled by materials brought down by the sea by the Roman General Caius Marius. The quantity of sand brought down by the Rhône is so considerable as to cause the navigation of its channel to vary continually, and the government whose regular business is to sound the bed of the river and make known its variations to shipmasters.

The Île de Carmague approaches in form to an equilateral triangle of about 25 m. each side. It is composed of a fine gravelly soil mingled with sand. The mouth of the island is the receptacle of stagnant waters, and is in great part occupied by the étang de Valaris and by others of less extent. These étangs and marshes often communicate with the sea, especially during the prevalence of the season, when the waves driven on by the strong sea-sand which, having preserved a great quantity of salt, imparts this quality to the herbage and renders it particularly acceptable to the cattle which are put to graze. To so great a degree is the soil in some parts impregnated with salt, that it would be unproductive, if the inhabitants did not flood the land by the waters of the Rhône, the rich mud of which corrects the drought that the salt would otherwise occasion. The majority of the dep. of the île de Carmague is of different parts or the island and saltworks are carried on. (Encyclop. Meth.)

Near the E. bank of the E. channel of the Rhône, between it and the étang de Berre, is the plain of La Crau, the most singular stony desert, says Mr. Arthur Young, the N. E. and S. E. sides of the marsh. It contains, according to the estimate of the same intelligent traveller, from 140,000 to 170,000 English acres. It is composed entirely of shingle, the stones varying in size from that of a pea to that of a pumpkin; and it is as free from any intermixture of soil as the shingle upon the seashore. In places these stones have become united so as to form a species of marble capable of receiving a polish. Beneath these stones is a soil which Mr. Young describes as not so much a sand as a kind of cemented marble, a small mixture of loam with fragments of stone. Vegetable life is poor and miserable, yet the district supplies winter pasturage to immense flocks of sheep which are fed in summer in the Alps about Barcelonette. By means of the Canal de Craonne, parts of this naturally sterile region have been broken up into corn and meadow land, and rendered productive, forming a striking contrast with the part which yet remains an arid desert. The lower grounds (for the surface is not level) produce oaks, walnut-trees, mulberry-trees though not of great size, olives, and vines. The almond-tree does most of the business of the district. [See Aves.] The soil of the dep. varies considerably. The N. E. and N. districts along the bank of the Durance are sterile and require great labour to make them productive, but the N.W. part is of great fertility. Unhappily this district is exposed to such disease as the smallpox, and is subjected to dengue, and maraschender a considerable part of the land near the coast incapable of cultivation. The produce of the dep. in corn is not great, being scarcely equal to a third of what is required for home consumption. Rice is among the grain cultivated here. (Robert. Dict. Géog.) A considerable portion of the district is cultivated with the vine, especially in the districts of Cassis and La Ciotat (white wines), are much esteemed. Olives form one of the chief objects of attention with the cultivators, and oil is one of the most important of its productions; and almonds, nuts, capers, oranges, pomegranates, and figs, are abundant. The mildness of the climate is favourable to the growth of shrubs and flowers, among which may be mentioned the cypress, the laurel, the myrtle, the cistus, and the philyrea. The pasturages of this dep. are chiefly resorted to in winter; in summer they are abandoned as being too hot. The great heat extends to the more refreshing plains of Drôme, Isère, and Hautes and Basses Alpes. The use of the plain of La Crau for this winter pasturage has been already noticed. It is said that 700,000 sheep and an immense number of goats are possessed by the dep. The latter is in great demand, and is also very great; and a large number of light active horses are produced. The Île de la Camargue is chiefly occupied in pasture. The cattle are here left at liberty night and day, from which cause they are very wild. There are large grazing grounds on this island, and a great number of houses, which are about 350 farms, the occupants of which rear annually 40,000 sheep, 3000 oxen, and as many horses. In this island is the royal sheep farm of L'Armillière. The district of Crau produces manna and an insect called termes, which are of great value. The district of Lourmarin is also very populous, and the numerous saltworms is much attended to in the department of Bouches du Rhône. The salt marshes yield herbs of which the inhabitants make use.

In the dep. coal is dug, and there are quarries of marble of all colours and of great value, freestone, slate, grey stone, limestone, whetstone, and flint, or flint stone, or basalt, and a stone capable of being wrought like alabaster. The Encyclopédie Méthodique adds that there are several mines of iron and lead.

The climate, as may be inferred from its productions, is warm: and would be most delightful to the inhabitants, were they not, at least in the neighbourhood of Marseille, exposed to the annoyance of swarms of gnats. The violence of the wind called Mistral is also a great drawback. The materials are very various, paper, wove, and various kinds, morocco and other leather, porcelain, earthenware, glass, and soda are manufactured. Brandy is distilled: and liqueurs and vinegar are made.
But perhaps the chief branch of manufacture is that of soap, which enjoys a high and deserved reputation all over France. The exports of the dep. comprehend its natural productions, wine, oil, honey, wax, dried fruits, &c., the flax (flaxseeds, sardines, tunnies, &c.) caught and cured within its limits, and which are consumed in the Royal navies, especially those of Toulouse and Marseille is the chief port in the dep., and indeed, excepting Bordeaux, in all France. [MARSEILLE.] The internal trade is facilitated by the navigation of the Rhône and of the canal of Arles, which runs from Arles to the sea nearly parallel to the arm of the Rhone. The canals de Craponne, du Réal, de Boisgelin, and de Végueryau, are rather for the purpose of irrigation or drainage. The canal de Craponne runs from the Durange to the Rhône at Arles, with branches to Isticks and to St. Chamans, both of which are near the dep., and, in the dep. of the canal du Réal is in the N.W. part of the department: that of Boisgelin runs from and again into the Durange; that of Végueryau drains the marshes E. of Arles. The Durange, we believe, is, from its rapidity, not navigable.

The dep. is subdivided into the three arrondissements of Marseille (which is the capital of the department), of Aix, and of Arles: and contains 27 cantons and 105 communes. The pop. in 1832 was 359,473: about 154 or 155 to the sq. m. The pop. at the previous census of 1826 was 326,302, showing an increase of 35,171, or of more than 10 per cent. The pop. of 1826 was divided among the three arrondissements: arrond. de Marseille, 178,806; arrond. of Aix, 102,674; arrond. of Arles, 77,933. The dep. for ecclesiastical purposes is divided into the diocese of Marseille, including that city and its arrond., and the sub-dep. of Aix and Arles. The diocese of Aix, in 1826, was formerly divided among the dioceses of Aix, Arles, and Marseille: but the diocese of Arles is now (it is probable) incorporated with that of Aix, the archbishop of that see taking the title of from Aix, Ares, and Embrun. The Bishopric of Marseille is one of his suffragans. The dep. is under the jurisdiction of the Cour Royale of Aix; and is included in the VIIIth Military division, of which Marseille is the capital. It sends five members to the Chamber of Deputies. There is an Académie Universitaire at Aix, which includes a faculty of teaching.
